EB.4

ENCYCLOPÆDIA BRITANNICA;
OR, A
DICTIONARY
OF
ARTS, SCIENCES, &c.

On a PLAN entirely New:

By WHICH,
THE DIFFERENT SCIENCES AND ARTS
Are digested into the FORM of Distinct
TREATISES OR SYSTEMS,

COMPREHENDING
The HISTORY, THEORY, and PRACTICE, of each,
according to the Latest Discoveries and Improvements;

AND FULL EXPLANATIONS ARE GIVEN OF THE
VARIOUS DETACHED PARTS OF KNOWLEDGE,
WHETHER RELATING TO
NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL,
CIVIL, MILITARY, COMMERCIAL, &c.

TOGETHER WITH
A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, &c.
throughout the WORLD;
A General HISTORY, *Ancient and Modern*, of the different Empires, Kingdoms, and States;
AND
An Account of the LIVES of the most Eminent Persons in every Nation,
from the earliest ages down to the present times.

THE WHOLE COMPILED FROM
THE WRITINGS OF THE BEST AUTHORS, IN SEVERAL LANGUAGES; THE MOST APPROVED DICTIONARIES,
AS WELL OF GENERAL SCIENCE AS OF PARTICULAR BRANCHES; THE TRANSACTIONS, JOURNALS, AND MEMOIRS, OF LEARNED
SOCIETIES, BOTH AT HOME AND ABROAD; THE MS. LECTURES OF EMINENT PROFESSORS ON DIFFERENT SCIENCES;
AND A VARIETY OF ORIGINAL MATERIALS, FURNISHED BY AN EXTENSIVE CORRESPONDENCE.

The SECOND EDITION; greatly Improved and Enlarged.

ILLUSTRATED WITH ABOVE THREE HUNDRED COPPERPLATES.

VOL. X.

INDUCTI DISCANT, ET AMENT MEMINISSE PERITI.

EDINBURGH:

Printed for J. BALFOUR and Co. W. GORDON, J. BELL, J. DICKSON, C. ELLIOT, W. CREECH,
J. McCLIESH, A. BELL, J. HUTTON, and C. MACFARQUHAR.

ARTS AND SCIENCES

Dictionary of Arts, Sciences, &c.

Sculpture.

SCULPTURE, the art of carving wood, or hewing stone, into images.

The antiquity of this art is past doubt; as the sacred writings, the most ancient and authentic monuments we have of the earliest ages, mention it in several places: witness Laban's idols stolen away by Rachel, and the golden calf which the Israelites set up in the desert, &c. But it is very difficult to fix the original of the art, and the first artists, from profane authors; what we read thereof being intermixed with fables, after the manner and taste of those ages.

The first works in sculpture were with clay, not only in making statues, but in forming models; and to this day a sculptor never undertakes any thing considerable, without forming a model either in clay or wax. In making figures of these materials, they begin and finish their work with their hands, using only three or four pieces of wood, which are roundish at one end, and at the other flat, with a sort of claws and teeth, which are to smooth and scratch the work. For waxen models, to every pound of wax add half a pound colophony; some add turpentine, and melt it together with oil of olives, more or less of the latter being used as they would have the matter harder or softer; some also add a little vermilion to give it a colour: this is wrought and moulded with the fingers like clay.

For sculpture in wood, which we properly call CARVING., the first thing required is to choose wood proper for the work the sculptor is to perform. If it be any thing large, and that requires a great deal of strength and solidity, the hardest and most durable wood is to be chosen; and for smaller works and ornaments, the softer wood is used; but it must be such, however, as is firm and close: for a large work, though it be only a single figure, it is better to make use of several pieces of wood, or bits of board, glued together, than of one whole piece, which is more liable to crack; for a single piece of wood may not be dried to the heart, however it may appear on the outside. See CARVING.

In sculpture in marble and other stone, the first thing to be done is to saw out a block of marble, of the bigness of the work to be performed; and this being done, the superfluities are to be taken off by a stubbed point and a heavy mallet: thus bringing it near the measures required, the sculptor reduces it still nearer with a finer tool, called a dog's tooth, it having two points, but one not so sharp as the other. After this he makes use of his gradine, which is a flat cutting tool

with three teeth; he then takes off, with a smooth chisel, the scratches the gradine left on the marble, and uses it with dexterity and delicacy to give softness and tenderness to his figure; till at length, taking rasps of different degrees of fineness, the work is gradually rendered fit for polishing. To polish the work, the sculptor uses pumice-stone and smalt; then he goes over it with tripoli; and when he would give it more lustre, rubs it with leather and straw-ashes. There are several other tools used by sculptors, adapted to the different parts of the work and the nature of the stone they make use of. As the models of clay shrink as they grow dry, whenever sculptors undertake a considerable piece of work, they only use the model for making a mould of plaster or stucco, in which is formed a figure of the same matter, which serves them thenceforth for a model, and by which they adjust all their measures and proportions. To proceed the more regularly, on the head of the model they place an immoveable circle divided into degrees, with a moveable rule or index, fixed in the centre of the circle, and divided also into equal parts: from the end of the rule hangs a line with a plummet, which serves to take all the points, to be transferred thence to the block of marble, from whose top hangs another plummet like that of the model. But there are some excellent sculptors who disapprove of this method; urging, that the smallest motion of the model changes their measures; for which reason they choose rather to take all their measures with the compasses.

For the casting of statues or figures of metal, and the moulding of statues, &c. of stucco, plaster, &c. see the articles CASTING, FOUNDRY of Statues, &c.

SCUM, properly denotes the impurities which a liquor, by boiling, casts up to the surface. The term *scum* is also used for what is more properly called the scoria of metals.

SCURVY, in medicine. See that article, n° 97, 448.

SCURVY-GRASS, in botany. See COCHLEAREA. The officinalis, or common official scurvy-grass, grows upon rocks on the sea coast, and on the Highland mountains, abundantly. It has an acrid, bitter, and acid taste, and is highly recommended for the scurvy. There are instances of a whole ship's crew having been cured of that distemper by it; and as it abounds with acid salts, there can be no doubt but that it is a great refresher of putrefaction. The best way of taking it

Sculpture

Scurvy-
grass.

Scutage
Scytala.

it is raw in a salad. It is also diuretic, and useful in dropies. The Highlanders esteem it as a good stomachic.

The coronopus, another species, was some years ago rendered famous, the ashes of it being an ingredient in Mrs Joanna Stephens's celebrated medicine for the stone and gravel; but, unfortunately for those afflicted with that excruciating complaint, it has not been able to support its credit. It is acrid, and tastes like garden cress.

SCUTAGE (*scutagium*, Sax. *scildpening*), was a tax or contribution raised by those that held lands by knights-service, towards furnishing the king's army, at one, two, or three merks for every knight's fee. Henry III. for his voyage to the Holy Land, had a tenth granted by the clergy, and *scutage* three merks of every knight's fee by the *layty*. This was also levied by Henry II. Richard I. and king John. See KNIGHT-SERVICE.

SCUTE, (*scutum*) a French gold coin of 3s. 4d. in the reign of king Henry V. And Catharine queen of England had an assurance made her of sundry castles, manors, lands, &c. valued at the sum of 40,000 *scutes*, every two whereof were worth a noble. *Ret. Parl.* i. Hen. VI.

SCUTTLES, in a ship, square holes cut in the deck, big enough to let down the body of a man, and which serve upon some occasions to let the people down into any room below, or from one deck to another.

SCYLAX, a celebrated mathematician and geographer in the isle of Caryanda, in Caria, flourished under the reign of Darius Hytaspes, about 522 B. C. Some have attributed to him the invention of geographical tables. We have under his name a geographical work published by Hoeschelius; but it is written by a much latter author, and is perhaps only an abridgement of Scylax's Ancient Geography.

SCYLLA, (anc. geog.) a rock in the Fretum Siculum, near the coast of Italy, dangerous to shipping, opposite to Charybdis, a whirlpool on the coast of Sicily: both of them famous in mythology.

SCYROS, (anc. geog.) an island in the Egean sea, opposite to the middle of Eubœa to the east, with a cognominal town, (Ptolemy). The country of king Lycomedes; where Achilles, in the habit of a girl, was educated and lay concealed, to prevent going to the siege of Troy; who debauched Didamia, the king's daughter, and by her had Pyrrhus, (Ovid.) famous also for the death and place of exile of Theseus, king of Athens, (Valerius Maximus). Anciently inhabited by the Dolopes, a race of intolerable robbers, expelled by Timon the Athenian, (Thucydides, Plutarch). Now *Sciro*. E. Long. 25. o. N. Lat. 38. 15.

SCYTALA LACONICA, in antiquity, a stratagem or device of the Lacedæmonians, for the secret writing of letters to their correspondents, so that if they should chance to be intercepted, nobody might be able to read them.—To this end they had two wooden rollers, or cylinders, perfectly alike and equal; one whereof was kept in the city, the other by the person to whom the letter was directed. For the letter, a skin of very thin parchment was wrapped round the roller, and thereon was the matter written; which done, it was

taken off, and sent away to the party, who, upon putting it in the same manner upon his roller, found the lines and words in the very same disposition as when they were first wrote. This expedient they set a very high value on; though, in truth, artless, and gross enough: the moderns have improved vastly on this method of writing. See CIPHER.

SCYTHIA, an ancient name for the northern parts of Asia, now known by the name of *Tartary*; also for some of the north-eastern parts of Europe.

This vast territory, which extends itself from the Ilter or Danube, the boundary of the Celtes, that is from about the 25th to almost the 110th degree of east longitude, was divided into Scythia in Europe, and Scythia in Asia, including, however, the two Sarmatias; or, as they are called by the Greeks, *Sauromatias*, now the Circassian Tartary, which lay between and severed the twq Scythias from each other. Sauromatia was also distinguished into European and Asiatic; and was divided from the European Scythia by the river Don or Tanis, which falls into the Paulus Meotis; and from the Asiatic by the Rha, now Volga, which empties itself into the Caspian sea.

1. The Asiatic Scythia comprehended, in general, great Tartary, and Russia in Asia; and, in particular, the Scythia beyond or without Imaus contained the regions of Bogdoi or Ostiacoi, and Tanguti. That within, or on this side Imaus, had Turkestan and Mongal, the Ubeck or Zagatai, Kal-muc and Nagaian Tartars; besides Siberia, the land of the Samoiodes, and Nova Zembla. These three last not being so soon inhabited as the former, as may be reasonably supposed, were wholly unknown to the ancients; and the former were peopled by the Bactrians, Sogdians, Gandari, Sacks, and Massagetes. As for Sarmatia, it contained Albania, Iberia, and Colchis; which makes now the Circassian Tartary, and the province of Georgia.

2. Scythia in Europe, reached (towards the south-west) to the Po and the Alps, by which it was divided from the Celtes, or Celto-Gallia, and by the Rhine northward. It was bounded on the south by the Ilter or Danube, and the Euxine sea. Its northern limits have been supposed to stretch to the spring-heads of the Boristhenes or Nieper, and the Rha or Volga, and so to that of the Tanais.—The ancients divided this country into Scythia Arimaspa, which lay eastward, joining to Scythia in Asia; and Sarmatia Europæana on the west. In Scythia, properly so called, were the Arimaspei on the north; the Getæ or Dacians along the Danube, on the south; and the Neuri between these two. So that it contained the European Russia, or Muscovy, and the lesser Crim Tartary eastward; and, on the west, Lithuania, Poland, part of Hungary, Transilvania, Walachia, Bulgaria, and Moldavia. Sarmatia is supposed to have reached northward, to that part of Swedeland called *Fennigia*, now *Finland*; in which they placed the Oœnes, Panoti, and Hippopodes. This part they divided from northern Germany, now the west part of Sweden and Norway, by the *Mare Sarmaticum* or *Scythicum*, which they supposed ran up into the northern ocean, and, dividing Lapland into two parts, formed the western part of Sweden, with Norway, into one island, and Finland into another; supposing this also

Scythia.

Although the ancient Scythians were celebrated as a warlike people, yet their history is too uncertain and obscure to enable us to give any detail which would not prove equally tiresome and uninteresting to the reader.

SEA, is frequently used for that vast tract of water encompassing the whole earth, more properly called *ocean*. See OCEAN.

With regard to the depth or profundity of the sea Varenius affirms, that it is in some places unfathomable, and in others very various, being in certain places $\frac{3}{4}$, $\frac{2}{3}$, $\frac{4}{5}$, $\frac{1}{2}$, $\frac{3}{5}$, $\frac{1}{3}$, $\frac{2}{5}$, $\frac{1}{4}$ English miles, in other places deeper, and much less in bays than in oceans. In general, the depths of the sea bear a great analogy to the height of mountains on the land, so far as is hitherto discovered.

There are two principal reasons why the sea doth not increase by means of rivers, &c. falling every where into it. The first is, because waters return from the sea by subterranean cavities and aqueducts, thro' various parts of the earth. Secondly, because the quantity of vapours raised from the sea, and falling on the land, only cause a circulation, but no increase, of water. It hath been found by calculation, that in a summer's day there may be raised in vapours, from the Mediterranean Sea, 528000000000 tons of water; and yet this sea receiveth not, from all its nine great rivers above 18270000000 tons per day, which is but a third part of what is exhausted in vapours.

SEA, is more properly used for a particular part or

division of the ocean; denominated from the countries it washes, or from other circumstances.—Thus we say, the *Irish sea*, the *Mediterranean sea*, the *Baltic sea*, the *Red sea*, &c.

Till the time of the emperor Justinian, the sea was common and open to all men: whence it is that the Roman laws grant an action against a person who shall prevent another in the free navigation or fishing therein.—The emperor Leo, in his 56th novel, first allowed such as were in possession of the land the sole privilege of fishing before their respective territories, exclusive of all others: he even gave a particular commission to certain persons, to divide the Thracian Bosphorus among them. From that time, the sovereign princes have been endeavouring to appropriate the sea, and to withdraw it from the public use. The republic of Venice pretends to be so far mistress in her gulf, that there is a formal marriage every year, between that seignory and the Adriatic.

In these last ages, the British have particularly claimed the empire of the sea in the channel; and even that of all the seas encompassing the three kingdoms of England, Scotland, and Ireland; and that as far as the shores of the neighbouring states. In consequence of which pretension it is, that children born on these seas are declared natural Britons, as much as if born on British ground.—The justice of this pretension is strenuously argued between Grotius and Selden, in the *Mare Liberum*, and *Mare Clausum*.

Encroachments by the Sea on the Dry Land. It has been matter of dispute whether the land or the water are gaining upon each in this terraqueous globe, and it is a dispute which seems not to be capable of an easy solution. In many places, it is certain that the sea has gained very considerably, and very recently too. In Britain several remarkable encroachments have been remarked. In the reign of Augustus, the isle of Wight made part of the island of Britain, so that at low water the Britons crossed over towards it with cart-loads of tin; but now the connection is totally cut off, and the isle of Wight is constantly separated from Britain by a channel half a mile wide. And in other places the same encroachments are perceptible. In general, on the eastern coast, the sea has gained ground; while on the southern and western, it has gained in some places, and lost in others. It has gained considerably on the coast of Yorkshire, Norfolk, Suffolk, Essex, and the eastern shore of Kent; as also that of Sussex, Hampshire, Dorsetshire, and Cornwall. Within this last half century also the sea has made large encroachments upon the islands of Scilly, and from May 1766 to May 1767 was observed to encroach 40 inches. It has also encroached upon the coasts of North Devonshire, Penbrokehire, and Cardiganhire. But, on the other hand, in the southern parts of Kent, in Lincolnshire and Lancashire, the land has gained upon the sea. In Kent, it has retreated from the beach of Sandwich, sunk the small ætuary of Solinus into an insignificant current, and converted a fine harbour, called by the Romans *Rubtæpe*, where their fleet were regularly laid up, into a valley watered by a river. In Lincolnshire it has added a considerable quantity of ground to the coast, and left many thousand acres betwixt the old bank of

its waters and the present margin of its shore. And in Lancashire, the sands which originally formed the beach of the sea, and were covered every tide with its waters, are now regularly inhabited. They still retain the name given them by the Britons, viz. *Meales*, or *loose quaggy lands*; tho', loose and quaggy as they once were, they are now cultivated, and a parochial church and village erected upon them.

From considering these facts, we may doubt whether the sea in fact has gained on the land, or the land on the sea; as what is gained by either on one side may perhaps be lost on the other. Buffon imagines, that the sea is perpetually gaining upon the land, and will at last cover the tops of the highest mountains, leaving its present bed quite dry; but his notions concerning the gradual motion of the waters from one place to another have been so fully refuted under the article EARTH, that it is needless to mention any thing further concerning them in this place. Others there are who argue strenuously for the continual increase of dry land, and decrease of the sea. Their principal argument is drawn from a supposition of the vegetation of stone, and a petrifying quality inherent in sea water.

A Scotch gentleman, who was at Boulogne in the summer 1750, has favoured us with a remarkable instance of this petrifying quality in sea-water. He observed, that the British channel, which washes the bottom of a hill near that place, (commonly called *Cæsar's Fort*, from a Roman encampment still visible on it, said to have been constructed by Julius Cæsar when he invaded Britain), had worn in thro' a great part of the hill, which consists mostly of mixed land, with about three or four feet of a strong bluish clay soil above. As the sandy part is washed away, the clay falls down in large masses, and, as the inhabitants there affirm, is petrified by the salt water. In fact, one sees, about 40 or 50 yards within the present high-water mark, a large stratum of rocks, much resembling the black-rocks at Leith; and between these and the hill many huge masses of rock, though there appears nothing rocky on the bare side of the hill next the channel. And the inhabitants of Boulogne are every day seen blowing up these rocky masses with gun-powder, burning the stones into lime, and using them also as stones for their buildings. This gentleman, walking one day on the sands, saw a large lump of clay fallen from the hill, and so lying to be washed by the tide. He impressed a mark on it with his stick, which, being soft, it then easily received. But passing the same way about three weeks afterwards, he could not force his stick into the same lump.

From some limestone quarries also in the neighbourhood of Kirkcaldy in Fife, and which are taken notice of under the article QUARRY, it is inferred that stones vegetate, and that the waters of the sea have retreated ever since the deluge. These two causes, say the abettors of this doctrine, in a long series of ages, alter the face of our globe entirely, or rather have reduced the earth into its present form, by creating rocks at the bottom of the sea, and then leaving them in dry land, where they turn into inland mountains. This seems to be the method which nature observes: for all along our coasts there are limestone rocks, and some of them within low-water mark, which have the very same inclination, and the same mixture of petri-

fied sea-bodies, as in the quarry we have described; but since we see rocks of this kind arising out of the sea, we must of necessity ascribe the same origin to such as are more remote from the shore, and left up in the country.

All rocks, therefore, where such extraneous bodies are found, seem to be formed from the common sediment of the sea, as sands of several kinds, with the bones of fishes, stalks of sea-weed, and empty shells, which are all rolled into beds by the agitation of the waters. These different bodies, thus blended together, are, by the violence of the flux and reflux, banked up towards the shore: which is the cause of the inclination or dipping of the rock. No sooner is one stratum laid, than, by a continual accession of the same matter, a second is superinduced; and so on successively, till the mass has reached a certain height in water. These loose materials, as soon as the vegetation commences, are fastened by a very strong cement, and, as at the sight of Medusa's head, begin to assume the consistency of stone. For the petrific matter fills up all the interstices, pervades the pores of the most solid bodies, and lodges every where the particles that enter into its own composition; which seems to be a fixed salt, or very powerful astringent, together with a mixture of mineral juices or metallic ores, which run in small veins, like wire, in several places of the rock.

The shells, being of a close and compact texture, and therefore refusing admission to the grosser parts, seem to have received only the finer parts of the mixture, which has converted them into a transparent substance, somewhat resembling crystal. The seaweeds, of a more porous and spongy nature, have imbibed the whole lapidific matter; which has changed them into a fine white marble, capable of a very high polish. The like may be said of all the other bodies, as they are more rare or dense in their texture, and fitted to receive more or less of the petrific matter.

The only difficulty in this hypothesis, and what we must endeavour to surmount, is, that we must conceive the sea to be so high as to cover all the hills where such sea-bodies are to be found. So, in the present case, we must suppose it to have been above 200 feet higher than it is at present. Now, though neither history nor tradition could assist us in the inquiry, yet still the fact may be ascertained from indelible monuments, and more to be depended on than any human testimony whatever. For since our inland hills have the very same inclination, and the same mixture of shells, &c. as the rocks have which stand within low-water mark; what can we think, but that the former once stood where the latter stand now? why may we not conclude for certain, that, according to their distances, they have all successively arisen from the sea, as the only proper matrix for such productions, and the only place, too, where the materials that enter into their composition can be found? In short, by means of these petrified sea-bodies, we trace the waters which drowned the old world, like an enemy who leaves his spoils behind him in his retreat, from the tops of our highest inland hills down to the shore; and there see them all confined within the limits of our present sea, which seems still to be making the proper dispositions for leaving

leaving us. Historians, when all our helps fail, produce medals and gold coins, as an authentic evidence of certain facts; in like manner, we may look upon sea-rocks, turned into inland hills, to be an undeniable proof that our earth hath arisen, inch by inch, from the sea.

The age of man bears so small a proportion to the age of the world, that the insensible changes made on the face of nature pass unobserved. We see so few alterations in our own times, that we conclude, too hastily, that there are none at all; or, when the land makes any encroachments in one place, the sea, we imagine, takes her revenge by inundations in another, and that in this manner their limits are pretty well secured. But this is undoubtedly a very lame account of the matter. For inundations seldom happen, and are but partial; whereas the recesses of the waters is universal, and, like the other great laws of nature, acts incessantly at all times. An earthquake in one place, the washing of loose sands and earths in another, may lay some particular spots under water; but these will by no means balance the encroachments of the land, remarkable more or less over all the globe. We will but give two or three instances out of many which with equal facility might be produced.

The island Pharos, according to Homer, who, perhaps spoke from experience, stood a day's sailing with a fair wind from the continent. That island, however, was joined to the land, in very ancient times, by a causeway of 900 paces, and makes now a part of the city of Alexandria. The city of Tyre, before the time of Alexander the Great, and for some ages after, was surrounded with a very deep sea of four fathoms over; and yet we know for certain, it has been joined to the continent upwards of 1000 years.—Æneas landed at Lavinium, if we can believe Virgil; but Lavinium stands now above 12 miles from the sea, and as rich vineyards and corn-fields as are in Italy must for ever go by the name of the *Lavinian shores*.—Ostia too has undergone the same fate, and become an inland town. Nothing but the express authority of historians, and its own stately ruins, could convince us that it was the celebrated Ostia built at the mouth of the Tiber.—The same observations may be extended to all the maritime towns famous in ancient history: their old harbours are now all choked up, buried under ground, or deserted by the sea, and left far up in the country.

Nor is there much weight in an objection that may be started in this place, namely, That there are several sea-port towns, famous in the ancient world, which have the same character in our own times. So London, under the emperor Nero, was, as it still is, a rendezvous of merchants, and a place of great foreign trade. But are we sure that these towns, though they have the same names, occupy also the same spots of ground with the old ones? Is it not more probable, that the inhabitants, not out of choice, but absolute necessity, and for the convenience of shipping, draw gradually down towards the sea as the rivers choke up towards their sources? This, we know, has happened to some, and we have great reason to believe the same of all.

“We may produce several very strong circumstances, which, taken all together, will amount to the force

of a direct proof that the land has gained very considerably on our coasts. Whoever views the Carle of Falkirk from Stirling castle in Scotland, will think it extremely probable, that all that champaign country, as the ancients believe of the Lower Egypt, has been gained from the sea, by the vast quantity of sand and mud brought down the river. To confirm this conjecture, whenever the ground is digged in several places thereabouts, they meet with vast collections of shells and other spoils of the sea. A ship's anchor was found, some time since, in the same country, buried under ground, at two miles distance from the Forth. These two circumstances put it out of all doubt, nor need we any further proof of the matter. We have nothing but the name to inform us, that ever Burntisland was surrounded with the sea; but whoever views the situation of that place, will be convinced, that, not many centuries ago, it has been joined to Eke by a narrow and flat neck of land to the north. The inhabitants of Kirkcaldy, even those of a middle age, remember to have seen the tides flow a great deal higher than they do at present. The truth of it is, our shores are insensibly rising, not only from the huge sand-banks, but from a vigorous vegetation of stone, which prevails, among all our coasts, at the bottom of the sea. For nature is as hard at work now as ever; and it is improbable, that these rocks, where there is such a mixture of sea-bodies, which but just show their heads above water, will occasion as much speculation to future ages as their elder brothers in the inland places of the country do to us.

The encroachments of the land in the frith of Tay are more remarkable, and seem to be of a more recent date. The whole Carle of Gowrie has been, we may say, but a late acquisition from the sea; as the flat face of the country, and names of the towns, sufficiently evince. Most of their towns begin or end with *isle*, that is, *island*; as Meg-*isle*, Inse-*tower*, &c. probably the very names they went by when they were sand-banks, or islands surrounded by the sea.—Some old written instruments mention Errol as a place standing to the south of Tay, though it stands a long mile to the north of the river at present. The inhabitants of the country have a tradition, that the course of Tay, in former ages, was by the foot of the hills to the north of Errol, and to this day they show the very holes in rocks to which the ships cables were fastened. But if the Tay ran so far to the north, as there is great reason to believe, all the lower grounds to the south of Errol would be drowned, and that frith would be twice, if not thrice, as broad as it is in our time.—The inhabitants of Perth remember to have heard their fathers say, that, in the high hill of Kinnoil, they have seen the remains of staples and rings, with other conveniences for shipping, as in a harbour. At a village two miles above Perth, and far from the Tay, some workmen draining a peat-marsh, found the ring, stock, and shaft, of an anchor, with a great log of wood standing erect in the earth, to which it was conjectured the ships cables were fixed. The children of the workmen were lately alive to attest this fact.

These circumstances make it probable, that the land is continually usurping upon the sea, and also may reconcile us to what follows; for if the limestone quarry in the neighbourhood of Kirkcaldy was a
sea-

sea-rock, as it undoubtedly was, our frith must have covered twice the extent of ground that it does at present. All the lower part of Fife, for some miles up the country, except some islands here and there, and which are now hills or high lands, would be laid under water. The Lothians must have shared the same fate with Fife: for the very spot on which Edinburgh stands, would be covered with water; the Castle-rock, Calton-hill, and Salisbury Craig, would be sea-rocks; Arthur's seat would be diminished almost to its head; and, with respect to the coast then, might appear what Inse Keith does to us. Northumberland and the Merse must have been in the same situation with the counties bordering on the Forth. The lower part of these two counties would be deluged with a great sea, whose shores would be five or six miles westward from Berwick. The Tweed must have been so great a frith, that the largest ship in the present navy of England might have gone up the river, as far as Kello, if not farther. We call places by their names which then had none. In this manner we might make the tour of Great Britain, and, by imagining the sea to be 200 or 300 feet higher than it is at present, demonstrate, that our island is larger, by a third at least, than it was at that time.

Such has been the state of our island; in a very remote period of time, no doubt; though perhaps not in the ages immediately succeeding the deluge: on the contrary, it may be presumed, that as many ages must have passed from the deluge to the period we are speaking of as from thence to our own times. For we have all the reason in the world to believe, that, ever since the old world was drowned, the waters have fallen equally in equal times, and not faster at one time than at another as is commonly imagined. The bare rocks on our highest hills show sufficiently both the place where they have vegetated, and that for many ages they have borne the violence of that dreadful element: for it is impossible to conceive, that they could have come out of nature's hands in the miserable and ruinous condition in which they appear. Their ragged tops, tattered surfaces, and rifted sides, are the wounds they have received from an obdurate foe; who, though vanquished at last, has made many furious attacks, and disputed every inch of ground, before he has retreated.

It is very probable, that, in the earlier ages after the flood, the country between the Tweed and the Tay might appear in the following manner. The Cheviot hills to the south, and Lamermoor hills to the north, would be the limits of the frith of Tweed; the same Lamermoor hills to the south, and the Lomond hills to the north, would be the boundaries of the frith of Forth; the Lomond hills to the south, and a like ridge of hills to the north of the Tay, would be the confines of the frith; so that in all the space betwixt the Tweed and the Tay there would be three very great friths, with no inland intervening but the backs of these bare hills, which would show like long tongues of land running out a great way in the sea.

In reality, when one views the country around, from any of the high hills we have mentioned, and observes it sloping gradually from the inland parts down to the sea, and on each hand towards the beds of the rivers, one can hardly forbear thinking it was once in

such a situation, and that it still looks like the shore of a great sea, which has now, after a long succession of ages, almost disappeared. For, not only the earth slopes, as we have said before, towards the sea, or towards the rivers; but the very rocks, contrary to their natures, conform themselves to this inclination. The flat rocks, where the growth or vegetation runs horizontally, dip all at one extremity; whereas we might expect to find them all lying in the plane of the horizon. Again, in some kind of flint rock, where the vegetation shoots directly upwards, the flakes of the stone are all reflected from the perpendicular, and make a very obtuse angle with the horizon, not under 120 degrees, as nearly as can be guessed. Now, it is absolutely impossible to account for such an inclination, unless we suppose that the sand-banks, of which these rocks were originally formed, having been shored up towards the land, by the flux and reflux of the waters, before they were fixed by vegetation."

There are some of the strongest arguments which have been advanced for the continual increase of the dry-land, and decrease of the sea. How far they appear conclusive, we leave to the judgment of the reader.

Luminousness of the Sea. See LIGHT, n° 26.

SEA-Anemony, the same with *ANIMAL-flower*, a species of marine animals of the nature of polypi, very much resembling vegetables in their method of generation. In these creatures the young grow out from their sides, and when they are arrived at a certain size fall off from the parent. They are multiplied likewise by cutting them in pieces. In some the young ones are produced from the inside, and after a certain season are ejected by the mouth, which will also be the case at any time if the old one is put to great pain. The Abbé Dique-marre has published three essays on these animals, in the 64th and 67th vol. of the Philosophical Transactions, in which a great number of experiments are related concerning them. In his last essay he mentions a species of sea-anemonies which propagate by tearing off small shreds from their own bodies, each of which thro' time becomes a perfect animal. See *ANIMAL-flower*.

SEA-Marks. The erection of beacons, light-houses, and sea-marks, is a branch of the royal prerogative. By 8 Eliz. 13. the corporation of the Trinity-house are empowered to set up any beacons or sea-marks wherever they shall think them necessary; and if the owner of the land or any other person shall destroy them, or take down any steeple, tree, or other known sea-mark, he shall be forfeit 100 l. Sterling; or, in case of inability to pay it, he shall be *ipso facto* outlawed.

SEA-Water, that briny bitterish fluid which constitutes the sea.

The saltness of this water is very rationally judged to arise from great multitudes both of mines and mountains of salt, dispersed here and there

in the depths of the sea. Dr Halley supposes that it is probable the greatest part of the sea-falt and of all falt lakes, as the Caspian Sea, the Dead Sea, the Lake of Mexico, and the Titicaca in Peru, is derived from the water of the rivers which they receive : and since this sort of lakes has no exit or discharge but by the exhalation of vapours ; and also since these vapours are entirely fresh, or devoid of such particles ; it is certain the saltness of the sea and such lakes must from time to time increase, and therefore the saltness at this time is greater than at any time heretofore. He further adds, that if, by experiments made in different ages, we could find the different quantity of salt which the same quantity of water (taken up in the same place, and in all other the same circumstances) would afford, it would be easy from thence, by rules of proportion, to find the age of the world very nearly, or the time wherein it has been acquiring its present saltness.

With regard to the use of this falt property of sea-water, it is observed, that the saltness of the sea preserves its waters pure and sweet, which otherwise would corrupt and stink like a filthy lake, and consequently that none of the myriads of creatures which now live therein could then have a being. From thence also the sea-water becomes much heavier, and therefore ships of greater size and quantity may be used thereon. Salt water also doth not freeze so soon as fresh water, whence the seas are more free for navigation. We have a dissertation, by Dr Russel, concerning the medical uses of sea-water in diseases of the glands, &c. wherein the author premises some observations upon the nature of sea-water, considered as impregnated with particles of all the bodies it passes over, such as submarine plants, fish, salts, minerals, &c. and saturated with their several effluvia, to enrich it, and keep it from putrefaction : whence this fluid is supposed to contract a soapiness ; and the whole collection, being pervaded by the sulphureous steams passing through it, to constitute what we call *sea-water*, the confessed distinguishing characteristics of which are saltness, bitterness, nitrocity, and unctuousity : whence the author concludes, that it may be justly expected to contribute signally to the improvement of physic. The cases in which our author informs us we are to expect advantage from sea-water, are, 1. In all recent obstructions of the glands of the intestines and mesentery. 2. All recent obstructions of the pulmonary glands, and those of the viscera, which frequently produce consumptions. 3. All recent glandular swellings of the neck, or other parts. 4. Recent tumours of the joints, if they are not suppurated, or become scirrhous or cancerous, and have not carious bones for their cause. 5. Recent desquations upon the glands of the eye-lids. 6. All desquations of the skin, from an erysipelas to a lepra. 7. Diseases of the glands of the nose, with their usual companion a thickness of the lip. 8. Obstructions of the kidneys, where there is no inflammation, and the stone not large. 9. In recent obstructions of the liver, this method will be proper, where it prevents constipations of the belly, and assists other medicines directed in icteric cases. The same remedy is said to be of signal service in the bronchocele ; and is likewise recommended for the

prevention of those bilious colics that so frequently afflict our mariners.

Freshening SEA-Water. The method of making sea-water fresh, an advantage long wanted for the benefit of navigation, is now found to be easily performed by the simple process of distillation in a common still. This method was published by Dr Lind some time ago, and cannot by any means be improved, as the process is already reduced to its utmost simplicity. A pretended improvement was afterwards proposed by Dr Irvine ; for which he had the dexterity not only to get the merit of Dr Lind's discovery, but a premium of L. 5000. The improvement, if such it may be called, consists only in having a very large tube instead of the worm of the common still, and a person to wet the tube constantly with a mop, instead of using a worm-tub.

SEA-Needle, Horn-fish, Gar-fish. See *ESOX*.

SEA-Nettle. See *URTICA Marina*.

SEA-Pie or Oyster-Catcher. See *HÆMATOPUS*.

SEA-Serpent, a monstrous creature, said to inhabit the northern seas about Greenland and on the coasts of Norway. Pontoppidan, in his natural history of Norway, brings several testimonies of mariners who pretend to have seen it ; but no distinct account of its form and properties has been obtained. According to the relations there given, the sea-serpent is thicker than a large hoghead, and upwards of 600 feet in length ; with large blue eyes, resembling two polished pewter-plates, when seen at a distance. Sometimes it raises part of its body out of the water, so that its head will reach above the highest masts : and it is thought to be able to sink the largest man of war by throwing itself across it : yet it is said to be a timid animal ; and not only has never been known to do hurt, but flies from the slightest appearance of injury, &c. See Plate CCLXV.

SEA-Plants. Count Marfigli, who was at indefatigable pains to collect the various sea-plants of several places, divides all those productions into three classes.

The first class contains the soft or herbaceous ones ; the second the ligneous ones, or such as are of a woody hardness ; and the third, those which are of the hardness of stone. Of the first class are the algas, called *sea-wrack* ; the fucuses, or sea-oaks ; the sea-mosses, or conservas ; and the different species of sponges.

Of the second kind are those called *lythophyta* by the ancients, as if their hardness approached to that of stones. All these consist of two substances, a cortical and an internal. The cortical part, while in the sea, is soft ; but in drying, it becomes as hard as chalk, or thereabouts, easily crumbling to pieces between the fingers : this is what deceived the ancients into an opinion of its being of a stony nature. The internal substance, properly speaking, seems to have more the nature of horn than of wood : if it is burnt, it throws out a smoke or froth, like that which horns or feathers of animals yield in the fire, and their smell in burning is of the same kind. The branches of these plants are very pliable, bending in the manner of whalebone ; and they give the same resistance to a knife in the cutting.

The stony plants, which should properly be called the *lythophyta*, but which never are called so, are the

several species of coral, madrepora, and the like. The madrepora differs from the coral, in having its surface pierced with almost innumerable holes. The corals, however, are now discovered to belong to the animal, not the vegetable kingdom. See CORAL.

The algae are the only sea-plants which have any roots, properly so called; these therefore grow out of the soft bottom of the sea as other plants out of the earth: but all the other sea-plants, without exception, appear fixed upon hard and solid bodies, incapable of affording them any nourishment; such as stones, shells, pieces of iron, of wood, &c. and sometimes on other plants; and they are not fastened to these substances by fibres passing into or surrounding them, but merely by a foot or pediment, capable of only fixing them down, not of drawing nourishment from the substances, were there any there. From this observation, the author concludes, that all the plants which have no roots, may be properly said to be all root, or to perform the office of roots in their whole substance, or that they take in nourishment in every part by certain pores, which in many are visible, and cover the whole surface.

This manner of receiving nourishment, he also observes, very well suits their condition, since they are always surrounded on all sides with that water by which they are to be nourished; whereas the plants which grow on land have only a part of them buried in the earth, from whence they are to be supplied with the proper juices. The roots of land-plants, therefore, have only the necessary organs for receiving supplies; whereas the sea-plants, he finds to be all over covered with small glandules, whose office it is to receive and to convey into the internal parts of the plant the proper juices for its nourishment; and these, he observes, are in general of a glutinous and milky nature. The great difference between the land and sea plants is seen in this familiar instance: A land-plant will remain fresh for a long time in all its parts, on one end of the stalk only being plunged in water; but a sea-plant, if part of it be out of water and part in, will always be fresh and vigorous in that part which is under water, while the part that is dry will wither and decay. It is easy hence to see, that the several parts of the land-plants have connections with and dependences on one another; whereas, in the sea-plant, every part takes in its own nourishment, and lives and flourishes wholly independent of the rest.

After having gone through this general system, the author descends to several remarkable particulars. He mentions an instance of a fucus, whose stalk, when in its growing state, is a quarter of an inch in diameter; yet in drying shrinks up so much, as to be not thicker than a single thread. Another species, called by the fishermen the *sea-orange*, from its resemblance to an orange in shape, he observes, is properly a fucus; it has neither stalk nor branches, but consists wholly of this globular body; it is not a solid substance, but a membrane of about one ninth of an inch in thickness, regularly distended into this shape by being filled with sea-water. All over the sides of this cavity there are fixed slender filaments, which traverse the whole, and probably receive nourishment from the water contained in the cavity, and distribute it to the several parts of the sides where they are inserted. Another sea-plant

this author mentions, only appears in the shape of a bark; it affixes itself to the branches of the lythophyta, when they have lost their natural bark, and sometimes in the same manner coats and crufts over the surface of stones. When it is fresh, it is of a lively red, of the consistence of a mushroom, and about the thickness of the back of a common knife; and its external surface is full of small prominences, which contain a glutinous juice; round about these also there stand several yellow tubercles, which, with the red of the ground of the plant, make upon the whole a very beautiful appearance. Its under-surface is perfectly smooth and glossy. This seems a much more remarkable plant, as to the manner of its vegetation, than those which grow on other plants at land.

SEA-Weed, or *Alga Marina*, is commonly used as a manure in those places where it can be had in plenty. The best is that cut from the rocks, and of which kelp is made. The second best is that called the *peasy fort*, and the worst is that with a long stalk. This kind of manure is used chiefly for the barley-crop; in which case, or for fallow, it is ploughed in directly. The people of the country have such an high opinion of its fertilizing qualities, that they sometimes lay it on after the barley is in the ground; but that is a slovenly and injudicious method. In the neighbourhood of Berwick, it is used in their compound dunghills, with fold-yard, stable-dung, and earth; and in that manner an immense quantity of dung is produced by such farmers as are situated near the sea. It is remarkable, that such farmers as use the sea-weed properly, have their lands in such heart as seldom to have occasion for a fallow to restore their freshness. This species of manure is experimentally found to be excellent for gardens, as it not only enriches the ground, but destroys all the kinds of vermin.

SEA-Wolf. See ANARRHICAS.

South-Sea. See PACIFIC OCEAN, and SOUTH-SEA.

SEAL, a punchon, piece of metal, or other matter, usually either round or oval; whereon are engraven the arms, device, &c. of some prince, state, community, magistrate, or private person, often with a legend or inscription; the impression whereof in wax serves to make acts, instruments, &c. authentic.

The use of seals, as a mark of authenticity to letters and other instruments in writing, is extremely ancient. We read of it among the Jews and Persians in the earliest and most sacred records of history. And in the book of Jeremiah there is a very remarkable instance, not only of an attestation by seal, but also of the other usual formalities attending a Jewish purchase. In the civil law also, seals were the evidence of truth, and were required, on the part of the witnesses at least, at the attestation of every testament. But in the times of our Saxon ancestors, they were not much in use in England. For though Sir Edward Coke relies on an instance of king Edwin's making use of a seal about 100 years before the conquest, yet it does not follow that this was the usage among the whole nation: and perhaps the charter he mentions may be of doubtful authority, from this circumstance of being sealed; since we are assured by all our ancient historians, that sealing was not then in common use. The method of the Saxons was, for such as could write to subscribe their names, and, whether they

they could write or not, to affix the sign of the cross: which custom our illiterate vulgar do for the most part to this day keep up, by signing a cross for their mark when unable to write their names. And indeed this inability to write, and therefore making a cross in its stead, is honestly avowed by Cædwalla, a Saxon king, at the end of one of his charters. In like manner, and for the same unformountable reason, the Normans, a brave but illiterate nation, at their first settlement in France, used the practice of sealing only, without writing their names: which custom continued when learning made its way among them, though the reason for doing it had ceased; and hence the charter of Edward the Confessor to Welmminster-abbey, himself being brought up in Normandy, was witnessed only by his seal, and is generally thought to be the oldest sealed charter of any authenticity in England. At the conquest, the Norman lords brought over into this kingdom their own fashions; and introduced waxen seals only, instead of the English method of writing their names, and signing with the sign of the cross. The impressions of these seals were sometimes a knight on horseback, sometimes other devices; but coats of arms were not introduced into seals, nor indeed into any other use, till about the reign of Richard I. who brought them from the croifade in the Holy Land, where they were first invented and painted on the shields of the knights, to distinguish the variety of persons of every Christian nation who resorted thither, and who could not, when clad in complete steel, be otherwise known or ascertained.

This neglect of signing, and resting only upon the authenticity of seals, remained very long among us; for it was held in all our books, that sealing alone was sufficient to authenticate a deed: and so the common form of attesting deeds, "sealed and delivered," continues to this day; notwithstanding the statute 29th Car. II. c. 3. revives the Saxon custom, and expressly directs the signing in all grants of lands and many other species of deeds: in which, therefore, signing seems to be now as necessary as sealing, though it hath been sometimes held that the one includes the other.

The king's *great seal* is that whereby all patents, commissions, warrants, &c. coming down from the king are sealed; the keeping whereof is in the hands of the lord chancellor. The king's *privy seal* is a seal that is usually first set to grants that are to pass the great seal.

SEAL is also used for the wax or lead, and the impression thereon, affixed to the thing sealed.

An amalgam of mercury with gold, reduced to a butyraceous consistence by straining off part of the mercury through leather, has been recommended as a proper material for taking off the impression of seals in wax. In this state, the compound scarce contains one part of mercury to two of gold; yet is of a silver whiteness, as if there was none of the precious metal in it. In this state it grows soft on being warmed or worked between the fingers; and is therefore proper for the purpose above-mentioned, but is not superior to some amalgams made with the inferior metals, as is well known to some impostors, who have sold for this use amalgams of the base metals as curious preparations of gold.

SEALER, an officer in chancery appointed by the lord chancellor or keeper of the great seal to seal the

writes and instruments there made, in his presence.

SEALING, in architecture, the fixing a piece of wood or iron in a wall with plaster, mortar, cement, lead, or other solid binding. For flapsles, hinges, and joints, plaster is very proper.

SEALING-Wax. See WAX.

SEAM or SEME of corn, is a measure of eight bushels.

SEAM of Glass, the quantity of 120 pound, or 24 stones, each five pounds weight. The seam of wood is an horse-load.

SEAM, in mines, the fame with a vein or stratum of metal.

SEAMEN, such persons as are reserved to serve the king or others, at sea; who may not depart without licence, &c. See MARITIME State.

Seamen fighting, quarrelling, or making any disturbance, may be punished by the commissioners of the navy with fine and imprisonment. Registered seamen are exempted from serving in any parish, office, &c. and are allowed bounty-money beside their pay. By the law of merchants, the seamen of a vessel are accountable to the master or commander, the master to the owners, and the owners to the merchants, for damage sustained either by negligence or otherwise. Where a seaman is hired for a voyage, and he deserts before it is ended, he shall lose his wages; and in case a ship be lost in a storm, the seamen lose their wages, as well as the owners their freight.

Means of preserving the Health of SEAMEN. There is scarce any article of more importance to a commercial nation than this, as by means of its seamen every such nation is not only enriched, but defended from its enemies. Seamen are subject to putrid disorders from many causes, the principal of which are the want of cleanliness, the bad air in ships, and the putrid provisions which they are often obliged in long voyages to feed upon. So exceedingly fatal were the diseases produced from these causes formerly, that when the first East-India vessels failed, three of them suffered so much from the scurvy by the time they had got only three degrees beyond the line, that the merchants who had embarked on this adventure were obliged to do duty as common sailors; and out of their complement of 480 men there died in all 105. Sir Richard Hawkins also, an intelligent and experienced officer who lived about that time, relates, that "in 20 years, during which he had used the sea, he could give an account of 10,000 mariners who had perished by the scurvy alone." We have also a striking instance of the fatal effects of the scurvy in lord Anson's celebrated voyage round the world. Soon after he had passed the straits of Le Maire, this disease began to appear among his men; and by the time that the Centurion had advanced a little way on her voyage, 47 had died of it in his ship; and there were but few on board who had not in some degree been affected, though they had scarce been eight months from England. In the ninth month, when standing for the island of Juan Fernandez, the Centurion lost double that number; and the mortality went on at so great a rate, that, before they arrived there, she had lost upwards of 200, and at last could muster no more than six men in a watch capable of doing duty. The other ships suffered in the same proportion.

* See Mr.
Ainslie,
No 277.

tion. After having reached the island, the crews quickly recovered their health: but they had continued only a short time at sea when the same fatal distemper broke out again; and before the Centurion, which now contained the survivors of all the three crews, had got the length of the island of Tinian, more than four-fifths of the original complement were destroyed. However, it is probable that this extreme mortality was not occasioned by the scurvy alone; but that it was conjoined with that putrid and pestilential distemper called the *jail or hospital fever* *. But whether this was the cause or not, it is certain that both these distempers originate from putrefaction, and the same causes which prevent the scurvy will also prevent the jail fever.

How great is the contrast between this fatal voyage of Lord Anson, and that of captain Cook, who, "with a company of 118 men, performed a voyage of three years and 18 days, throughout all the climates, from 52° north to 71° south, with the loss of only one man by a distemper;" and even this one, of a phthisis pulmonalis, or consumption of the lungs, of which he would in all probability have died though he had remained at land! As this far exceeds any thing of the kind ever known before, it is evident, that the means used by captain Cook for the preservation of his mariners must be looked upon as the best for preserving the health of seamen that ever have been found out; for which reason we shall in this article give a summary account of these means.

The ships, besides being fitted up in the completest manner for resisting the dangers of the sea, were supplied with several kinds of provisions different from those usually furnished. They had wheat instead of oatmeal; sugar instead of oil: they had also malt; four kront, salted cabbage; portable broth; salep; marmalade of carrots; and inspissated juice of wort and beer. Some of these had before been found highly antiscorbutic; and others were sent out by way of experiment, particularly the two last. From the malt was made sweet wort, which by Dr Macbride was recommended as a powerful antiscorbutic; and was given from five to six pints a-day, as the surgeon thought necessary. Sour kront is cabbage cut small; to which is put a little salt, some juniper-berries, and anniseeds. It is then fermented, and afterwards packed close in casks; in which state it will keep good for a long time. The allowance for each man was two pounds a-week; but was increased or diminished according to circumstances. Salted cabbage is the vegetable cut to pieces and salted down in casks, by which means it may be preserved for a long time. Portable broth is made from the ligamentous and mucilaginous parts of beef boiled down into a kind of glue, and afterwards diluted with boiling water. Salep and rob of lemons and oranges were used only for the sick and scorbutic who were under the care of the surgeon. Marmalade of carrots is the juice of yellow carrots inspissated till it becomes of the consistence of honey or treacle, which last it resembles both in taste and colour. It was recommended by baron Storch of Berlin as a very great antiscorbutic. The inspissated juice of wort and beer were invented some years ago by Mr Pelham secretary to the commissioners of the victualling-office. This gentleman considered, that if the juice of malt, either as beer or wort, was inspissated by evaporation,

it was probable that it would keep good at sea; and if so, that a supply of beer might be had at any time, by mixing it with water. Mr Pelham's experiments succeeded so well, that the commissioners caused 31 half-barrels of this juice to be prepared, and sent out along with captain Cook's ships for a trial; 19 on board the *Resolution*, and 12 on board the *Adventure*. They were also provided with fishing-nets, lines, and hooks of every kind, for catching fish, wherever that was practicable.

The general success of these articles and precautions has already been mentioned. With regard to particulars, captain Cook tells us, that to such of the men as showed the least symptom of the scurvy, and even to such as seemed inclined to it, sweet wort was given from one to two or three pints a-day each man; or in such proportion as the surgeon thought necessary, which sometimes amounted to three quarts. "This," says he, "is without doubt one of the best antiscorbutic medicines hitherto discovered; and will, with proper attention to other things, I am persuaded, prevent the scurvy from making any great progress for a considerable while. But I am not altogether of opinion that it will cure it at sea. Sour kront is not only a wholesome vegetable food, but in my opinion highly antiscorbutic, and it spoils not by keeping. A pound of this was served to each man, when at sea, twice a-week, or oftener, as was thought necessary. —An ounce of portable broth for each man, or such other proportion as circumstances pointed out, was boiled in their peak, three days in the week; and when we were in places where vegetables were to be got, it was boiled with them and wheat or oatmeal every morning for breakfast, and also with pease and fresh vegetables for dinner. It enabled us to make several nourishing and wholesome messes, and was the means of making the people eat a greater quantity of vegetables than otherwise they would have done. The surgeon made use of rob of lemons and oranges in many cases with great success. We were certainly gainers by the exchange of wheat instead of oatmeal, and sugar instead of oil. Sugar, I apprehend, is a very good antiscorbutic; whereas oil, such as the navy is usually supplied with, I am of opinion, has a contrary effect.

"But the introduction of the most salutary articles, either as provisions or medicines, will generally prove unsuccessful, unless supported by certain regulations. On this principle, many years experience, together with some hints I had from Sir Hugh Palliser, captains Campbell, Wallis, and other intelligent officers, enabled me to lay a plan whereby all was to be governed.

"The crew were at three watches, except upon some extraordinary occasions. By this means they were not so much exposed to the weather as if they had been at watch and watch; and had generally dry clothes to shift themselves when they happened to get wet. Care was also taken to expose them as little as possible to wet weather. Proper methods were used to keep their persons, hammocks, bedding, cloaths, &c. constantly clean and dry. Equal care was taken to keep the ship clean and dry between decks. Once or twice a-week she was aired with fires; and when this could not be done, she was smoked with gunpowder, mixed with vinegar or water. I had also fire-

Seamen.

frequently a fire made in an iron pot at the bottom of the well, which was of great use in purifying the air in the lower parts of the ship. To this and to cleanliness, as well in the ship as among the people, too great attention cannot be paid; the least neglect occasions a putrid and disagreeable smell below, which nothing but fires will remove. Proper attention was paid to the ship's coppers, so that they were kept constantly clean. The fat which boiled out of the salt-beef and pork I never suffered to be given to the people, being of opinion that it promotes the scurvy.

"I was careful to take in water wherever it was to be got, even when we did not want it; because I look upon fresh water from the shore to be more wholesome than that which has been kept for some time on board a ship. Of this essential article we were never at an allowance, but had always plenty for every necessary purpose. Navigators, indeed, cannot in general expect, nor would they wish to meet, with such advantages in this respect as fell to my lot. The nature of our voyage carried us into very high latitudes: but the hardships and dangers inseparable from that situation were in some degree compensated by the singular felicity we enjoyed of extracting inexhaustible supplies of fresh water from an ocean strewed with ice.

"We came to few places where either the art of man, or the bounty of nature, had not provided some sort of refreshment or other, either in the animal or vegetable way. It was my first care to procure whatever of any kind could be met with, by every means in my power, and to oblige our people to make use thereof both by my example and authority; but the benefits arising from refreshments of any kind soon became so obvious, that I had little occasion to recommend the one or to exert the other."

In lord Anson's voyage, those who were ill of the scurvy found themselves so much refreshed with the oranges and lemons they met with on the island of Tinnian, that these fruits have since been reckoned the best antiscorbutics in the world, and vast advantages were imagined to arise from the rob or extract of the juices of these fruits, if ships could be supplied with them in sufficient quantity. Captain Cook was supplied with some quantity; but his opinion is very different. In a letter to Sir John Pringle, dated July 7th 1776, he has the following paragraph: "I entirely agree with you, that the dearth of the rob of lemons and of oranges will hinder them from being furnished in large quantities: but I do not think this so necessary; for though they may assist other things, I have no great opinion of them alone. Nor have I a higher opinion of vinegar: my people had it very sparingly during the last voyage; and towards the latter part of it, none at all; and yet we experienced no ill effects from the want of it. The custom of washing the inside of the ship with vinegar I seldom observed, thinking that fire and smoke answered the purpose much better."—For further particulars relating to the means of prevention and cure of the scurvy, see the article *MEDICINE*, n° 448.

On the whole, it is easy to observe, that the same means which are necessary for the preservation of health at land, will also preserve it at sea; and without these the best medicines are ineffectual. The whole indeed may be comprehended under the following articles,

1. Plenty of wholesome food and drink. 2. Pure air. 3. Dry and warm lodging. 4. Moderate exercise, without excessive fatigue or want of sleep. If the provisions which ships carry out along with them would keep sound throughout the whole time of the voyage, there would be no more occasion for an exact regimen at sea than at land; but as the provisions necessarily spoil and become putrid in long sea-voyages, we are thence obliged to use large quantities of antiseptics, in order to correct that putrid tendency.—On land there is commonly a free circulation of air; and therefore the maladies which partly ensue from confined and putrid air in ships, have been thought to arise from some malignant quality in the sea-air itself: but if a proper circulation of air is produced throughout all the parts of the ship, either by ventilation or otherwise, the sea-air is found to be equally wholesome with that of land; nay, where the land-air is confined, as in jails and hospitals, it is found to produce diseases worse than even the scurvy. Lastly, if a person at land indulges himself in sloth and uncleanness, if his habitation is damp and dirty, he will very probably lose his health; and it is not to be wondered at if he should do the same in similar circumstances at sea. The means, then, of preserving the health of seamen are, besides an attention to the purity of the air, the cleanliness of the ship and crew, the laying in a sufficient stock of wholesome provisions, which will keep as long as possible, and renewing them as frequently as an opportunity can be found. And as drink is an article as essential to the preservation of health as food, a method of procuring a constant supply of pure uncorrupted water at sea must certainly be an object of the utmost importance; for which see the articles (*Freshening*) *SEA-WATER*, and *WATER* (*preserving it from putrefaction at sea*).

SEAPOYS, a name given to Indian soldiers who serve after the European manner. It is applied only to the natives of the East Indies.

SEARCLOTH, or *CERECLOTH*, in surgery, a form of external remedy somewhat harder than an unguent, yet softer than an plaster, though it is frequently used both for the one and the other. The cercloth is always supposed to have wax in its composition, which distinguishes and even denominates it. In effect, when a liniment or unguent has wax enough in it, it does not differ from a cercloth.

SEASIN, in a ship, the name of a rope by which the boat rides by the ship's side when in harbour, &c.

SEASONS, in cosmography, certain portions or quarters of the year distinguished by the signs which the sun then enters, or by the meridian altitudes of the sun; consequent on which are different temperatures of the air, different works in tillage, &c. The year is divided into four seasons; spring, summer, autumn, and winter.

SEBASTIAN, Sr. a handsome, populous, and strong town of Spain, in the province of Guipuscoa, with a good and well-frequented harbour. It is situated at the foot of a mountain; and the harbour secured by two moles, and a narrow entrance for the ships. The town is surrounded with a double wall, and to the sea-side is fortified with bastions and half-moons. The streets are long, broad, and straight, and paved with white flag-stones. At the top of the mountain is a citadel, with a garrison well-furnished with cannon.

The.

Seamen.

Sebastian.

Sebastiano,
Secale.

The town carries on a considerable trade, the greatest part of which consists of iron and steel, which some reckon to be the best in Europe. They also deal in wool, which comes from old Castile. W. Long. 1. 59. N. Lat. 43. 23. The capital of Brazil in South America is likewise called Sebastian.

SEBASTIANO, called *Del Pionbo*, from an office in the lead mines given him by Pope Clement VII. was an eminent Venetian painter, born in 1485. He was first a disciple of old Giovanni Bellino; continued his studies under Giorgione; and having attained an excellent manner of colouring, went to Rome, where he insinuated himself into the favour of Michael Angelo. He has the name of being the first who invented the art of preparing plaster-walls for oil-painting; but was so slow and lazy in his work, that other hands were often employed to finish what he began. He died in 1547.

SECALE, RYE; a genus of the d'ignia order, belonging to the triandria class of plants. There are four species, the most remarkable of which is the cerealis, or common rye cultivated in our fields. See AGRICULTURE, n° 112.—114.

Rye is next in price to wheat, which, though inferior to it in many respects, in some others it very much resembles. It rises higher than wheat; the ear is smaller, with shorter, sharper, and rougher awns; the grain is less in size, thinner and darker; the root not so bushy as that of wheat, and therefore does not so much exhaust the soil; it is earlier in the ear by a month. It is next in weight to wheat, the bushel being from 56 to 59 pounds; where they allow nine pecks to a bushel, it sometimes reaches to 67 pounds. In several places this grain with an early kind of wheat are sown and reaped together. This mixed corn is commonly called *maslin* (*swissellane*) and also *munck-corn* or *monk-corn*, corruptly for *monk-corn*, because bread made of it was commonly eat in monasteries. Professor Bradley assures us, that this was the sweetest and moistest bread he ever tasted. Many others are of the same opinion in this respect. But in the article of bread, we are at present rather governed by the sight than the taste. The general use of rye is for bread, of which there was much more formerly eaten than at present, and yet there is still more of it consumed in this way than of barley. Mr King estimates the produce of rye in his time at 10,000,000 of bushels. We grow at present 8,509,216 bushels, of which 7,992,000 are spent in bread, 284,000 are consumed in other uses, and 269,216 bushels are annually exported. This amounts to 283,7981; whereas in the last century, though we grew more, we imported considerable quantities, and consequently the nation gains very considerably by this grain. Rye-bread, in the opinion of good judges, is rather unwholesome than unpleasant. It is conceived to be of very difficult digestion, and therefore only fit for hard-working and laborious people. Besides this, it is black, heavy, and by no means pleasing to those who are not used to it; but, as appears from their continuing in the use of it, very acceptable, and agrees with such as have been accustomed to it from their youth. But this grain, being mixed with wheat, is thought from its clamminess, to contribute to keep the bread

made of it long moist, to give it an agreeable flavour, and to make it go farther, and to save the trouble of frequent baking. It yields a great deal of fine and strong spirit, and some use is made of it by the tanners.

Upon the whole, as the chief consumption of rye was in bread, and as for more than half a century past this has been continually diminishing, so we at present grow less of it than in times past, though we export more of it than we formerly did. It may, however, deserve some consideration, whether for several weighty reasons the culture of this grain should not be more attended to and encouraged; and, amongst others, for these that follow: Because it will grow almost every where, and on any soil, not only with little trouble, but, which is a circumstance not unworthy of notice, with less danger of failing than any other crop: Because, though less eaten than in former times, yet it is still in great esteem abroad, and especially in the northern parts of Europe, where the consumption of it is large, and it sells at a considerable price: and, lastly, Because our rye is thought wholesome, and much less, if indeed at all, exposed to that dreadful and deplorable malady the French call *ergot* (A), which frequently renders the eating it very dangerous and destructive, not to man only, but to all animals; and of course our rye from this fortunate circumstance will preserve a preference in foreign markets.

SECANT, in geometry, is a line that cuts another, or divides it into two parts.

SECEDEES, a sect of Presbyterians, who dissent from the established church of Scotland in the year 1733. The following circumstance gave rise to this sect. Messrs Erskine, Wilton, Moncrieff, and Fisher, ministers of the church of Scotland, obliquely refused, for several years, to obey the decisions of the General Assembly with regard to the settlement of ministers agreeably to the law of patronage: For this open contempt of authority, the assembly, after many and repeated admonitions, were at last obliged to eject them from their respective charges. These four clergymen, when they saw matters carried this length, immediately complained of persecution; professed uncommon sanctity and austerity of manners; and cried out that the church was over-run with various errors, such as, a compliance with the law of patronage; the tenderness of the assembly to professors Simpson and Campbell, who were accused of Arian and Arminian heresies; and a number of practical deviations from the covenanted reformation of Scotland: They even inveighed against the conduct of the government for their ready admission of malignant and wicked men into places of trust in the army and state; for the loose and unlimited restoration of Charles II. to the throne; for the restoration of Prelacy in England, which had been solemnly abjured; for restoring the superstitious Christmas vacation; for the repeal of the penal laws against witches, &c. &c. These things, joined to the popular talents of some of the above ministers, alarmed the minds of many well-meaning people, and in a few years procured a numerous train of followers. Elated with this unexpected success, they soon split into two parties. The chief point of contest among the leaders of this sect was concerning the lawfulness of what is called the *burgess-oath*; and hence the one party have

Secant,
Seceders.

(A) See Phil. Transf. N° 130. p. 758. It is a most horrid distemper, ending frequently in an incurable gangrene.

Seckendorf have ever since been called *Burghers*, and the other *Antiburghers*.

Second.

SECKENDORF (Guy Lewis de), a very learned German, descended from ancient and noble families, was born at Aurache in Franconia in 1626. He was a good linguist, learned in law, history, and divinity; and is said to have been a tolerable painter and engraver. He was honourably employed by several of the German princes; and died councillor of state to Frederick III. elector of Brandenburg, and chancellor of the university of Halle, in 1692. He wrote many books, particularly, "A history and defence of the Lutheran religion," 2 vols folio, Frankfurt, 1602, in Latin.

SECOMIÆ, in natural history, the name of a genus of fossils, of the class of septerizæ; the characters of which are, That they are bodies of a dusky hue; divided, by septa or partitions of a sparry matter, into several more or less regular portions; of a moderately firm texture; not giving fire with steel; but fermenting with acid menstrua, and easily calcining. The septerizæ of this genus are of all others the most common, and are what have been known by the little expressive or mistaken names of the waxen vein, or ludus Helmontii. We have many species of these bodies known among us. Of the whitish or brownish, we have 13; of the yellowish, five; and of the ferruginous ones, four.

SECOND, in geometry, chronology, &c. the 60th part of a prime or minute, whether of a degree or of an hour.

SECOND, in music, one of the musical intervals; being only the difference between any found and the next nearest found, whether above or below it.

SECOND Major, in music. See **INTERVAL**.

SECOND Minor, in music. See **INTERVAL**.

SECOND-SIGHT, a peculiar faculty, ascribed to some of the inhabitants of the Highlands of Scotland, by which they are said to foretel certain events before they come to pass. Some have denied, and others affirmed, the existence of this gift; instead of troubling our readers with the various accounts which they give of it, we shall present them with the following observations upon this subject by Dr Beattie of Aberdeen, whose account of the second-sight appears to us rational and well founded.

The Highlands of Scotland are a picturesque, but a melancholy country. Long tracts of mountainous desert, covered with dark heath, and often obscured by misty weather; narrow valleys, thinly inhabited, and bounded by precipices resounding with the fall of torrents; a soil so rugged, and a climate so dreary, as in many parts to admit neither the amusements of pastoral, nor the labours of agriculture; the mournful dashing of waves along the friths and lakes that intersect the country; the portentous noises which every change of the wind and every increased diminution of the waters is apt to raise in a lonely region full of echoes and rocks and caverns; the grotesque and ghastly appearance of such a landscape by the light of the moon: objects like these diffuse a gloom over the fancy, which may be compatible enough with occasional and social merriment, but cannot fail to tincture the thoughts of a native in the hour of silence and so-

litude. If these people, notwithstanding their reformation in religion, and more frequent intercourse with strangers, do still retain many of their old superstitions, we need not doubt but in former times they must have been much more enslaved to the horrors of imagination, when beset with the bugbears of Popery and Paganism. Most of their superstitions are of a melancholy cast. That of *second-sight*, by which some are still supposed to be haunted, is considered by themselves as a misfortune, on account of the many dreadful images it is said to obtrude upon the fancy. It is said that some of the Alpine regions do likewise lay claim to a sort of second-sight. Nor is it wonderful, that persons of a lively imagination, immersed in deep solitude, and surrounded with the stupendous scenery of clouds, precipices, and torrents, should dream (even when they think themselves awake) of those few striking ideas with which their lonely lives are diversified; of corpses, funeral processions, and other subjects of terror; or of marriages, and the arrival of strangers, and such like matters of more agreeable curiosity.

Let it be observed also, that the ancient Highlanders of Scotland had hardly any other way of supporting themselves than by hunting, fishing, or war, professions that are continually exposed to fatal accidents. And hence, no doubt, additional horrors would often haunt their solitude, and a deeper gloom overshadow the imagination even of the hardiest native.

A sufficient evidence can hardly be found for the reality of the *second-sight*, or at least of what is commonly understood by that term. A treatise on the subject was published in the year 1762, in which many tales were told of persons whom the author believed to have been favoured, or haunted, with these illuminations; but most of the tales were trifling and ridiculous: and the whole work betrayed, on the part of the compiler, such extreme credulity, as could not fail to prejudice many readers against his system.

That any of these visionaries are apt to be swayed in their declarations by sinister views, we will not say; but this may be said with confidence, that none but ignorant people pretend to be gifted in this way. And in them it may be nothing more, perhaps, than short fits of sudden sleep or drowsiness, attended with lively dreams, and arising from some bodily disorder, the effect of idleness, low spirits, or a gloomy imagination. For it is admitted, even by the most credulous Highlanders, that as knowledge and industry are propagated in their country, the second-sight disappears in proportion; and nobody ever laid claim to the faculty who was much employed in the intercourse of social life. Nor is it at all extraordinary, that one should have the appearance of being awake, and should even think one's self so, during those fits of dozing; that they should come on suddenly, and while one is engaged in some business. The same thing happens to persons much fatigued, or long kept awake, who frequently fall asleep for a moment, or for a long space, while they are standing, or walking, or riding on horseback. Add but a lively dream to this slumber, and (which is the frequent effect of disease) take away the consciousness of having been asleep, and a superstitious man may easily mistake his dream for a waking vision; which, how-

Second
Secretary.

however, is soon forgotten when no subsequent occurrence recalls it to his memory; but which, if it shall be thought to resemble any future event, exalts the poor dreamer into a Highland prophet. This conceit makes him more recluse and more melancholy than ever; and so feeds his disease, and multiplies his visions: which, if they are not dissipated by business or society, may continue to haunt him as long as he lives; and which, in their progress through the neighbourhood, receive some new tinctures of the marvellous from every mouth that promotes their circulation. As to the prophetic nature of this second-sight, it cannot be admitted at all. That the Deity should work a miracle in order to give intimation of the frivolous things that these tales are made up of, the arrival of a stranger, the nailing of a coffin, or the colour of a suit of cloaths; and that these intimations should be given for no end, and to those persons only who are idle and solitary, who speak Galic, or who live among mountains and deserts, is like nothing in nature or providence that we are acquainted with; and must therefore, unless it were confirmed by satisfactory proof (which is not the case), be rejected as absurd and incredible.

These visions, such as they are, may reasonably enough be ascribed to a disordered fancy. And that in them, as well as in our ordinary dreams, certain appearances show, on some rare occasions, resemble certain events, is to be expected from the laws of chance; and seems to have in it nothing more marvellous or supernatural, than that the parrot, who deals out his frivolities at random, should sometimes happen to salute the passenger by his right appellation.

SECONDARY, in general, something that acts as second or in subordination to another.

SECONDARY *Qualities of Bodies*. See METAPHYSICS, n° 32, 35.

SECONDAT. See MONTESQUIEU.

SECRETARY, an officer who, by his master's orders, writes letters, dispatches, and other instruments, which he renders authentic by his signet. Of these there are several kinds; as, 1. Secretaries of state, who are officers that have under their management and direction the most important affairs of the kingdom, and are obliged constantly to attend on the king: they receive and dispatch whatever comes to their hands, either from the crown, the church, the army, private grants, pardons, dispensations, &c. as likewise petitions to the sovereign, which, when read, are returned to them; all which they dispatch according to the king's direction. They have authority to commit persons for treason, and other offences against the state, as conservators of the peace at common law, or as justices of the peace throughout the kingdom. They are members of the privy-council, which is seldom or never held without one of them being present. As to the business and correspondence in all parts of this kingdom, it is managed by either of the secretaries without any distinction; but with respect to foreign affairs, the business is divided into two provinces or departments, the southern and the northern, comprehending all the kingdoms and states that have any intercourse with Great Britain; each secretary receiving all letters and addresses from, and making all dispatches to, the several princes and states comprehended in his province. Ireland and the Plantations are un-

der the direction of the elder secretary, who has the southern province, which also comprehends France, Italy, Switzerland, Spain, Portugal, and Turkey: the northern province includes the Low Countries, Germany, Denmark, Sweden, Poland, and Muscovy. Each of the secretaries has an apartment in all the royal houses, both for their own accommodation and their officers; they have also a table at the king's charge, or else board-wages. The two secretaries for Britain have each two under secretaries, and one chief clerk; with an uncertain number of other clerks and translators, all wholly depending on them. To the secretaries of state belong the custody of that seal properly called the *signet*, and the direction of two other offices, one called the *paper-office*, and the other the *signet-office*. 2. Secretary of an embassy, a person attending an ambassador, for writing dispatches relating to the negotiation. There is a great difference between the secretary of an embassy, and the ambassador's secretary; the last being a domestic or menial of the ambassador, and the first a servant or minister of the prince. 3. The secretary of war, an officer of the war-office, who has two chief clerks under him, the last of which is the secretary's messenger. There are also secretaries in most of the other offices.

SECRETION, in the animal economy, the separation of some fluid mixed with the blood by means of the glands. See the article GLAND.—In the bodies of animals we observe a great number of juices of different natures, viz. the blood, lymph, saliva, stomach-liquor, intestinal juices, pancreatic juice, bile, urine, &c. and the blood is the general source of all. See the articles BLOOD, LYMPH, SALIVA, &c.

SECT, a collective term, comprehending all such as follow the doctrines and opinions of some famous divine, philosopher, &c.

SECTION, in general, denotes a part of a divided thing, or the division itself. Such, particularly, are the subdivisions of a chapter; called also *paragraphs*, and *articles*: the mark of a section is §.

SECTION, in geometry, denotes a side or surface appearing of a body or figure cut by another; or the place where lines, planes, &c. cut each other.

SECTOR, in geometry, is a part of a circle, comprehended between two radii and the arch; or it is a mixed triangle, formed by two radii and the arch of a circle.

SECTOR, is also a mathematical instrument of great use in finding the proportion between quantities of the same kind, as between lines and lines, surfaces and surfaces, &c. for which reason the French call it the *compass of proportion*.

The great advantage of the sector above common scales, &c. is, that it is adapted to all radii, and all scales. For, by the line of chords, fines, tangents, &c. adapted to any radius betwixt the length and breadth of the sector, when opened.

The sector is founded on the fourth proposition of the sixth book of Euclid, where it is demonstrated, that similar triangles have their homologous sides proportional; an idea of its foundation or theory may be conceived from what follows. Let the lines AB, AC, ^{Plate} represent the two legs of the sector, and AD, AE, ^{CCLXVII.]} two equal sections from the centre. If now the points BC and DE be connected, the lines BC and DE will be ^{fig. 6.}

Secretion
Sector.

Sector.

be parallel: therefore the triangles ADE, and ABC, will be similar, and consequently the sides AD, DE, AB, BC, proportional; that is, as AD:DE::AB:BC; whence, if AD be the half, third, or fourth part of AB, DE will be a half, third, or fourth part BC. Whence it follows, that if AD be the chord, sine, tangent, &c. of any number of degrees to the radius AB, DE will be the same to the radius BC.

Sector.

Plate CCLXXVII.
fig. 7, 8.

Description of the SECTOR. This instrument consists of two equal legs or rules of brass, &c. riveted together, but so as to move easily on the rivet: on the faces of the instrument are placed several lines; the principal of which are the line of equal parts, line of chords, line of sines, line of tangents, line of secants, and line of polygons.

The line of equal parts, called also the *line of lines*, marked L, is a line divided into 100 equal parts, and where the length of the leg will allow it, each of these is subdivided into halves and quarters. It is found on each leg, on the same side, and the divisions numbered 1, 2, 3, 4, 5, &c. to 10, which is near the extremity of each leg. Note, in practice, 1 represents either 1, 10, 100, 1000, 10000, &c. as occasion requires; in which case, 2 represents 2, 20, 200, 2000, 20000, &c. and so of the rest. The line of chords, marked C on each leg, is divided after the usual manner, and numbered 10, 20, 30, &c. to 60. The line of sines, denoted on each leg by the letter S, is a line of natural sines, numbered 10, 20, 30, &c. to 90. The line of tangents, denoted on each leg by the letter T, is a line of natural tangents, numbered 10, 20, 30, &c. to 45. Besides which, there is another little line of tangents on each leg, commencing at 45°, and extending to 75°, denoted by the letter t. Line of secants, denoted on each leg by the letter f, is a line of natural secants, numbered 10, 20, 30, &c. to 75, not commencing at the centre of the instrument, but at some distance therefrom. The line of polygons, denoted by the letter P on each leg, is numbered 4, 6, 5, &c. to 12, which falls considerably short of the centre of the instrument.

Besides these lines, which are essential to the sector, there are others placed near the outward edges on both sides, and parallel thereto; which are in all respects the same as those on Gunter's scale, and used after the same manner. Such are the lines of artificial sines marked S, of artificial tangents marked T, and Gunter's line of numbers marked N; these lines do not extend to the end of the instrument. There are sometimes other lines placed, to fill the vacant spaces, as the lines of hours, latitudes, and inclination of meridians, which are used the same as on the common scales.

The lines found by the sector are of two kinds, lateral and parallel; the first are such as are found by the sides of the sector, as AB, AC, (fig. 6.) the latter such as go across from one leg to the other, as DE, BC. Note, the lines are not placed in the same order on all sectors, but they may be easily found by the above directions.

Use of the Line of Equal Parts on the SECTOR. 1. To divide a given line into any number of equal parts, suppose seven. Take the given line in your compass; and setting one foot in a division of equal parts, that may be divided by seven, for example, 70,

whose seventh part is 10, open the sector till the other point fall exactly on 70, in the same line on the other leg. In this disposition, applying one point of the compasses to 10, in the same line, shut them till the other fall in 10, in the same line, on the other leg, and this opening will be the seventh part of the given line. Note, if the line to be divided be too long to be applied to the legs of the sector, divide only one half or one fourth by 7, and the double or quadruple thereof will be the seventh part of the whole.

2. To measure the lines of the perimeter of a polygon, one of which contains a given number of equal parts. Take the given line in your compasses, and set it parallel, upon the line of equal parts, to the number on each leg expressing its length. The sector remaining thus, set off the length of each of the other lines parallel to the former, and the numbers each of them falls on will express their lengths.

3. A right line being given, and the number of parts it contains, suppose 120, to take from it a shorter line, containing any number of the same parts, suppose 25. Take the given line in your compasses, open the sector till the two feet fall on 120 on each leg; then will the distance between 25 on one leg, and the same number on the other, give the line required.

4. To multiply by the line of equal parts on the sector. Take the lateral distance from the centre of the line to the given multiplicator; open the sector till you fit that lateral distance to the parallel of 1 and 1, or 10 and 10, and keep the sector in that disposition; then take in the compasses the parallel distance of the multiplicand, which distance, measured laterally on the same line, will give the product required. Thus, suppose it were required to find the product of 8, multiplied by 4: take the lateral distance from the centre of the line to 4 in your compasses, i. e. place one foot of the compasses in the beginning of the divisions, and extend the other along the line to 4. Open the sector till you fit this lateral distance to the parallel of 1 and 1, or 10 and 10. Then take the parallel distance of 8, the multiplicand; i. e. extend the compasses from 8, in this line, on one leg, to 8 in the same line on the other; and that extent, measured laterally, will give the product required.

5. To divide by the line of equal parts on the sector. Extend the compasses laterally from the beginning of the line to 1, and open the sector till you fit that extent to the parallel of the divisor; then take the parallel distance of the dividend, which extent, measured in a lateral direction, will give the quotient required. Thus, suppose it was required to divide 36 by 4; extend the compasses laterally, the beginning of the line to 1, and fit to that extent the parallel of 4, the divisor; then extend the compasses parallel, from 36 on one leg to 36 on the other, and that extent, measured laterally, will give 9, the quotient required.

Use of the Sine of Chords on the SECTOR. 1. To open the sector so as the two lines of chords may make an angle or number of degrees, suppose 40. Take the distance from the joint to 40, the number of the degrees proposed, on the line of chords; open the sector till the distance from 60 to 60, on each leg, be equal to the given distance of 40; then will the two

Sector.

lines on the sector form an angle of 40 degrees, as was required.

2. The sector being opened, to find the degrees of its aperture. Take the extent from 60 to 60, and lay it off on the line of chords from the centre; the number whereon it terminates will show the degrees, &c. required.

3. To lay off any number of degrees upon the circumference of a circle. Open the sector till the distance between 60 and 60 be equal to the radius of the given circle; then take the parallel extent of the chord of the number of degrees on each leg of the sector, and lay it off on the circumference of the given circle. Hence any regular polygon may be easily inscribed in a given circle.

Use of the Line of Polygons on the Sector. 1. To inscribe a regular polygon in a given circle. Take the semidiameter of the given circle in the compasses, and adjust it to the number 6, on the line of polygons, on each leg of the sector: then, the sector remaining thus opened, take the distance of the two equal numbers, expressing the number of sides the polygon is to have; *e. gr.* the distance from 5 to 5 for a pentagon, from 7 to 7 for a heptagon, &c. These distances carried about the circumference of the circle, will divide it into so many equal parts.

2. To describe a regular polygon, *e. gr.* a pentagon, on a given right line. Take the length of the line in the compasses, and apply it to the extent of the number 5, 5, on the lines of polygons. The sector thus opened, upon the same lines take the extent from 6 to 6; this will be the semi-diameter of the circle the polygon is to be inscribed in. If then, with this distance, from the ends of the given line, you describe two arches of a circle, their intersection will be the centre of the circle.

3. On a right line, to describe an isosceles triangle, having the angles at the base double that at the vertex. Open the sector, till the ends of the given line fall on 10 and 10 on each leg; then take the distance from 6 to 6. This will be the length of the two equal sides of the triangle.

Use of the Lines of Sines, Tangents, and Secants, on the Sector. By the several lines disposed on the sector, we have scales to several radiuses; so that having a length or radius given, not exceeding the length of the sector when opened, we find the chord, sine, &c. thereto. *e. gr.* Suppose the chord, sine, or tangent, of 10 degrees, to a radius of 3 inches required; make 3 inches the aperture, between 60 and 60, on the lines of chords of the two legs; then will the same extent reach from 45 to 45 on the line of tangents, and from 90 to 90 on the line of the sines on the other side; so that to whatever radius the line of chords is set, to the same are all the others set. In this disposition, therefore, if the aperture between 10 and 10, on the lines of chords, be taken with the compasses, it will give the chord of 10 degrees. If the aperture of 10 and 10 be in like manner taken on the lines of sines, it will be the sine of 10 degrees. Lastly, if the aperture of 10 and 10 be in like manner taken on the lines of tangents, it gives the tangent of 10 degrees.

If the chord, or tangent, of 70 degrees were required; for the chord, the aperture of half the arch, viz. 35, must be taken, as before; which distance,

repeated twice, gives the chord of 70 degrees. To find the tangent of 70 degrees to the same radius, the small line of tangents must be used, the other only reaching to 45: making, therefore, 3 inches the aperture between 45 and 45 on the small line; the extent between 70 and 70 degrees on the same, will be the tangent of 70 degrees to 3 inches radius.

To find the secant of an arch, make the given radius the aperture between 0 and 0 on the line of secants: then will the aperture of 10 and 10, or 70 and 70, on the said lines, give the tangent of 10°, or 70°.

If the converse of any of these things were required, that is, if the radius be required, to which a given line is the sine, tangent, or secant, it is but making the given line, if a chord, the aperture on the line of chords, between 10 and 10, and then the sector will stand at the radius required; that is, the aperture between 60 and 60 on the said line is the radius. If the given line were a sine, tangent, or secant, it is but making it the aperture of the given number of degrees; then will the distance of 90 and 90 on the sines, of 45 and 45 on the tangents, of 0 and 0 on the secants, be the radius.

Astronomical Sector. See *ASTRONOMICAL SECTOR*, something which is temporal; in which sense the word stands opposed to ecclesiastical: thus we say, secular power, secular jurisdiction, &c.

Secular is more peculiarly used for a person who lives at liberty in the world, not shut up in a monastery, nor bound by vows, or subjected to the particular rules of any religious community; in which sense it stands opposed to *regular*. The Romish clergy are divided into secular and regular.

Secular Games, in antiquity, solemn games held among the Romans once in an age. These games lasted three days and as many nights; during which time sacrifices were performed, theatrical shows exhibited, with combats, sports, &c. in the circus. The occasion of these games, according to Valerius Maximus, was to stop the progress of a plague. The first who had them celebrated at Rome was Valerius Publicola, the first consul created after the expulsion of the kings. The ceremonies to be observed therein were found prescribed in one of the books of the Sibyls. At the time of the celebration of the secular games, heralds were sent throughout all the empire, to intimate that every one might come and see those solemnities which he never yet had seen, nor was ever to see again. Authors are not agreed as to the number of years wherein these games returned, partly because the quantity of an age or *seculum* among the ancients is not known, and partly on other accounts: some will have it that they were held every hundred years, and that the *seculum* or age was our century.

Secular Poem, a poem sung or rehearsed at the secular games; of which kind we have a very fine piece among the works of Horace, being a sapphic ode at the end of his epodes.

SECULARIZATION, the act of converting a regular person, place, or benefice, into a secular one. Almost all the cathedral churches were anciently regular, that is, the canons were to be religious; but they have been since secularized. For the secularization of a regular church, there is required the authority of the pope, that of the prince, the bishop of the place,

Secular,
Seculariza-
tion.

Secundines place, the patron, and even the consent of the people. Religious that want to be released from their vow, obtain briefs of secularization from the pope.

SECUNDINES, in anatomy, the several coats or membranes wherein the fœtus is wrapped up in the mother's womb; as the chorion and amnios, with the placenta, &c.

SECUTORES, in antiquity, a kind of gladiators among the Romans, who fought against the rittarii. The secutores were armed with a sword and a buckler, to keep off the net or noose of their antagonists, and they wore a cask on their head.

This was also a name given to such gladiators as took the place of those killed in the combat, or who fought the conqueror.

SEDAN, a strong town of France in the province of Champagne, on the confines of Luxemburg. It is one of the keys to the kingdom; and there is a well-furnished arsenal, and a fine manufactory of woollen clothes and stuffs. It is seated on the river Marne, in E. Long. 5. 2. N. Lat. 49. 12.

SEDATIVES, in medicine, a general name for such medicines as weaken the powers of nature, such as venesection, cooling salts, purgatives, &c.

SE DEFENDO, in law, a plea used for him that is charged with the death of another, by alleging that he was under a necessity of doing what he did in his own defence: as that the other assaulted him in such a manner, that if he had not done what he did, he must have been in hazard of his own life. See **HOMICIDE**, and **MURDER**.

SEDIMENT, the settlement or dregs of any thing; or that gross, heavy part of a fluid body, which, upon resting, sinks to the bottom of the vessel.

SEDLEY (Sir Charles), an English poet and wit, the son of Sir John Sedley of Aylesford in Kent, was born about the year 1639. At the restoration he came to London to join the general jubilee; and commended wit, courtier, poet, and gallant. He was so much admired, that he became a kind of oracle among the poets; which made King Charles tell him, that Nature had given him a patent to be Apollo's viceroy. The productions of his pen were some plays, and several delicately tender amorous poems, in which the softness of the verses was so exquisite, as to be called by the duke of Buckingham *Sedley's witchcraft*. "There were no marks of genius or true poetry to be discerned, (say the authors of the *Biographia Britannica*;) the art wholly consisted in raising loose thoughts and lewd desires, without giving any alarm; and so the poison worked gently and irresistibly. Our author, we may be sure, did not escape the infection of his own art, or rather was first tainted himself before he spread the infection to others."—A very ingenious writer of the present day, however, speaks much more favourably of Sir Charles Sedley's writings. "He studied human nature; and was distinguished for the art of making himself agreeable, particularly to the ladies: for the verses of Lord Rochester, beginning with, *Sedley has that prevailing gentle art*, &c. so often quoted, allude not to his writings, but to his personal address." [*Langborne's Essay*, &c.]—But while he thus grew in reputation for wit and in favour with the king, he grew poor and debauched; his estate

was impaired, and his morals were corrupted. One of his frolics, however, issuing in an indictment and a heavy fine, Sir Charles took a more serious turn, applied himself to business, and became a member of parliament, in which he was a frequent speaker. We find him also in the House of Commons in the reign of James II. whose attempts upon the constitution he vigorously withstood; and he was very active in bringing on the revolution. This was thought more extraordinary, as he had received favours from James. But that prince had taken a fancy to Sir Charles's daughter, (though it seems he was not very handsome), and, in consequence of his intrigues with her, he created Miss Sedley countess of Dorchester. This honour, so far from pleasing, greatly shocked Sir Charles. However libertine he himself had been, yet he could not bear the thoughts of his daughter's dishonour; and with regard to her exaltation, he only considered it as rendering her more conspicuously infamous. He therefore conceived a hatred for the king; and from this, as well as other motives, readily joined to dispossess him of the throne. A witty saying of Sedley's, on this occasion, is recorded. "I hate ingratitude, (said Sir Charles); and therefore, as the king has made my daughter a countess, I will endeavour to make his daughter a queen;" meaning the princess Mary, married to the prince of Orange, who dispossessed James of the throne at the revolution. He lived to the beginning of queen Anne's reign; and his works were printed in 2 vols 8vo, 1710.

SEDR, or **SEDRÉ**, the high-priest of the sect of Ali among the Persians. The sedre is appointed by the emperor of Persia, who usually confers the dignity on his nearest relation. The jurisdiction of the sedre extends over all effects destined for pious purposes, over all mosques, hospitals, colleges, sepulchres, and monasteries. He disposes of all ecclesiastical employments, and nominates all the superiors of religious houses. His decisions in matters of religion are received as so many infallible oracles; he judges of all criminal matters in his own house without appeal. His authority is balanced by that of the muditehid, or first theologue of the empire.

SEDUCTION, the act of seducing, corrupting, or drawing aside.

SEDUCTION of Women-children. By 4. and 5 of *Ph. and Mary*, c. 8. if any person, above the age of fourteen, unlawfully shall convey or take away any woman-child unmarried (which is held to extend to bastards as well as to legitimate children) within the age of 16 years, from the possession and against the will of her father, &c. he shall be imprisoned two years, or fined at the discretion of the justices. See the statute, and *Blackst. Comment.* vol. iv. p. 108, 209.

SEDUM, **ORPINE**; a genus of the pentagynia order, belonging to the decandria class of plants. There are 19 species; of which the most remarkable are,

1. The telephium, common orpine, or live-long, hath a perennial root, composed of many knobbed tubercles, sending up erect, round, succulent stalks, branching half a yard or two feet high, garnished with oblong, plane, serrated, succulent leaves, and the stalks terminated by a leafy corymbus of flowers, of

Sedley

Sedum.

Sedum.

different colours in the varieties. This species is an inhabitant of woods and dry places in England, &c. but has been long a resident of gardens for variety and medical use.

2. The *anacampseros*, or decumbent ever-green Italian orpine, hath a fibrous perennial root, decumbent or trailing stalks, wedge-shaped entire leaves, and the stalks terminated by a corymbus of purple flowers. 3. The *rupestre*, rock sedum, or stone-crop of St Vincent's rock, hath slender, trailing, purple stalks; short, thick, awl-shaped, succulent, glaucous leaves in clusters, quinquefoliously imbricated round the stalks, and the stalks terminated by roundish cymose bunches of bright yellow flowers. It grows naturally on St Vincent's rock near Bristol, and other rocky places in Europe. 4. The *aiizon*, or Siberian yellow orpine, hath a tuberculate, fibrous perennial root; many upright, round, succulent stalks, a foot high; lanceolated, plane, serrated, thickish leaves; and the stalks terminated by a close-fitting cymose cluster of bright yellow flowers. 5. The *reflexum*, reflexed small yellow sedum, or prick-madam, hath a slender fibrous perennial root; small trailing succulent stalks, garnished with thick, awl-shaped, succulent leaves sparsely, the lower ones recurved, and the stalks terminated by reflexed spikes of bright yellow flowers. It grows naturally on old walls and buildings in England, &c. 6. The *acre*, acid sedum, common stone-crop of the wall, or wall-pepper, hath small fibry roots, very slender succulent stalks four or five inches high, very small, sub-oval, gibbous, erect, alternate leaves, close together, and the stalks terminated by trifid-cymose bunches of small yellow flowers. This sort grows abundantly on rocks, old walls, and tops of buildings, almost every where, which often appear covered with the flowers in summer. 7. The *sexangularis*, or hexangular stone-crop, hath a fibry perennial root; thick, short, succulent stalks; small, sub-oval, gibbous, erect leaves close together, arranged six ways imbrication, and the stalks terminated by bunches of yellow flowers. It grows on rocky and other dry places in England, &c. 8. The *album*, or white stone-crop, hath fibry perennial roots; trailing slender stalks, six or eight inches long; oblong, obtuse, sessile, spreading leaves; and the stalks terminated by branchy cymose bunches of white flowers. This grows on old walls, rocks, and buildings in England, &c. 9. The *hispanicum*, or Spanish sedum, hath fibrous perennial roots, crowned with clusters of taper, acute, succulent leaves; slender succulent stalks, four or five inches high, garnished also with taper leaves, and terminated by downy cymose clusters of white flowers.

All these species of sedum are hardy herbaceous succulent perennials, durable in root, but mostly annual in stalk, &c. which, rising in spring, flower in June, July, and August, in different sorts; the flowers consisting universally of five spreading petals, generally crowning the stalks numerous in corymbos and cymose bunches and spikes, appearing tolerably conspicuous, and are succeeded by plenty of seeds in autumn, by which they may be propagated, also abundantly by parting the roots, and by slips or cuttings of the stalks in summer; in all of which methods they readily grow and spread very fast into tufted bunches:

being all of succulent growth, they consequently delight most in dry soils, or in any dry rubbishy earth.

Uses. As flowering plants, they are mostly employed to embellish rock-work, ruins, and the like places, planting either the roots, or cuttings of the shoots, in a little mud or any moist soil at first, placing it in the crevices, where they will soon root and fix themselves, and spread about very agreeably. For economical purposes, the *reflexum* and *rupestre* are cultivated in Holland and Germany, to mix with lettuce in salads. The wall-pepper is so acrid, that it blisters the skin when applied externally. Taken inwardly, it excites vomiting. In scorbutic cases and quartan agues, it is said to be an excellent medicine under proper management. Goats eat it; cows, horses, sheep, and swine, refuse it.

SEED, in physiology, a substance prepared by nature for the reproduction and conservation of the species both in animals and plants. See GENERATION, PLANTS, SEMEN, and BOTANY, sect. v.

SEEDLINGS, among gardeners, denote such roots of gilliflowers, &c. as come from seed sown. Also the younger tender shoots of any plants that are newly sown.

SEEDY, in the brandy trade, a term used by the dealers to denote a fault that is found in several parcels of French brandy, which renders them unsaleable. The French suppose that these brandies obtain the flavour which they express by this name, from weeds that grow among the vines from whence the wine of which this brandy is pressed was made.

SEEING, the art of perceiving objects by the organ of sight; or it is the sense we have of external objects by means of the eye. See ANATOMY, n° 406 *et seq.* and OPTICS, n° 115 *et seq.*

SEGEBERG, a town of Germany, in the duchy of Holstein, and in Wagria; with a castle standing on a high mountain, consisting of limestone, large quantities of which are carried to Hamburg and Lubeck. It belongs to Denmark, and is seated on the river Treve; in E. Long. 10. 23. N. Lat. 54. 5.

SEGEDIN, a strong town of Lower Hungary, in the county of Czongrad, with a castle. The Imperialists took it from the Turks in 1686. It is seated at the confluence of the rivers Teisse and Mafroch, in E. Long. 20. 25. N. Lat. 46. 15.

SEGMENT of a CIRCLE, in geometry, is that part of the circle contained between a chord and an arch of the same circle.

SEGNA, or SEGNI, a strong town of Croatia, with a strong fort, a good harbour, and a bishop's see. It belongs to the house of Austria, and is seated on the coast of the Gulph of Venice. E. Long. 15. 2. N. Lat. 45. 4.

SEGNÍ, an ancient town of Italy, in the Campagna of Rome, with a bishop's see, and the title of duchy. It is said that organs were first invented here. It is seated on a mountain. E. Long. 13. 5. N. Lat. 41. 40.

SEGORBE, a town of Spain, in the kingdom of Valencia, with the title of a duchy, and a bishop's see. It is seated on the side of a hill, between the mountains, in a soil very fertile in corn and wine, and where there

Sedum
I
Segorbe

Segovia. there are quarries of fine marble. It was taken from the Moors in 1245; and the Romans thought it worth their while to carry some of the marble to Rome. W. Long. o. 22. N. Lat. 32. 54.

SEGOVIA, an ancient, large, rich, populous, and handsome city of Spain, in Old Castile, with a bishop's see, and a strong castle called *Alcazar*. It is adorned with handsome structures; and there are about 7000 houses, comprehending the suburbs. It is surrounded with a strong wall, flanked with towers and ramparts. Here the best cloth in Spain is made from the fine Spanish wool so much esteemed in other countries. This is one part of their trade, and another is very fine paper. The cathedral church stands on one side of the great square, and contains the statue of the Virgin Mary in massy silver. The alcazar is seated in the highest part of the town, is covered with lead, and has 16 rooms very richly adorned with tapestry, a great deal of gilding, and very fine ornaments of marble and porphyry. The royal chapel is magnificently gilded, and embellished with very fine paintings. The next most remarkable structure is the Casa de la Moneda, or the mint, whose towers are all covered with lead. It is seated in a valley, surrounded with a river, on which are mills, employed in coining, and by which every thing is done in an instant; for they can coin as much money here in a day as at other places in a month. The aqueduct is a work of the Romans, and serves to bring water into the town, being 3000 paces in length, and supported by 177 arches of a prodigious height. They consist of two rows, one placed above the other. It is seated on a mountain between two hills, near the river Arayada. W. Long. 3. 21. N. Lat. 40. 56.

SEGOVIA (New), a town of North America, in New Spain, and in the audience of Guatemala; seated on the river Yare, on the confines of the province of Honduras. W. Long. 84. 35. N. Lat. 13. 25.

SEGOVIA, a town of America in Terra Firma, and in the province of Venezuela, seated on a river, near a very high mountain, where there are mines of gold. W. Long. 65. 45. N. Lat. 7. 55.

SEGOVIA, a town of Asia, in the island of Manila, and one of the largest of the Philippines, seated at the north end of the island, 240 miles north of Manila, and subject to Spain. E. Long. 109. o. N. Lat. 18. 30.

SEGRAIS (John Renaud de), a French poet, born at Caen in 1624. Poetry was far from proving unprofitable to him; for it enabled him to rescue himself, four brothers, and two sisters, from the unhappy circumstances in which the extravagance of a father had left them. His prose writings, as novels and romances, though for the most part frivolous enough, have great merit as to their style, which may be considered as a standard. Of this kind are his *Nouvelles Françaises*, and the romances called *La Princesse de Cleves*, and *Zayde*; the latter of which has been often printed, with Mr Huet's *Origine des Romans* prefixed. This piece was written on purpose for it; and is, says Voltaire, a work of great use. But it is principally for his poetical works that Segrais is distinguished. These consist of, 1. *Diverses Poësies*, 4to, Paris 1658;

2. *Athis*, a pastoral; and, 3. A translation of Virgil's *Georgics* and *Eneid*.

SEGREANT, is the herald's word for a griffin when drawn in a leaping posture and displaying his wings as if ready to fly.

SEGUE, in the Italian music, is often found before *aria*, *alleluja*, *amen*, &c. to shew that those portions or parts are to be sung immediately after the last note of that part over which it is writ; but if these words *si place*, or *ad libitum*, are joined therewith, it signifies, that these portions may be sung or not, at pleasure.

SEJANT, a term used in heraldry, when a lion, or other beast, is drawn in an escutcheon fitting like a cat with his fore-feet straight.

SEJANUS, the son of a Roman knight, by his political talents became prime minister to the emperor Tiberius, over whom he gained for some time such an ascendancy that he governed the empire, till his cruelties and ambitious designs opened the eyes of Tiberius, and he was condemned and executed in the same day, A. D. 51.

SEIGNIOR, is, in its general signification, as much or *lord*; but is particularly used for the lord of the fee as of a manor, as *seigneur* among the feudists is he who grants a fee or benefit out of the land to another; and the reason is, because having granted away the use and profit of the land, the property or dominion he still retains in himself.

SEIGNIORAGE, is a royalty or prerogative of the king, whereby he claims an allowance of gold and silver bought in the masts to be exchanged for coin. As seigniorage, out of every pound weight of gold, the king had for his coin 5 s. of which he paid to the master of the mint sometimes 1 s. and sometimes 1 s. 6 d. Upon every pound weight of silver, the seigniorage answered to the king in the time of Edward III. was 18 penny-weight, which then amounted to about 1 s. out of which he sometimes paid 8 d. at others 9 d. to the master. In the reign of king Henry V. the king's seigniorage of every pound of silver was 15 d. &c.

SEIGNIORY, is borrowed from the French *seigneurie*, i. e. *dominatus*, *imperium*, *principatus*; and signifies with us a manor or lordship, *seignory* de *seignemans*. *Seignory in gross* seems to be the title of him who is not lord by means of any manor, but immediately in his own person; as *tenure in capite*, whereby one holds of the king as of his crown, is *seignory in gross*.

SEISIN, in law, signifies possession. See the next article.—In this sense we say, *premier seisin*, for the first possession, &c.

Seisin is divided into that *in deed* or *in fact*, and that *in law*. A seisin *in deed* is where a possession is actually taken: but a seisin *in law* is, where lands descend, and the party has not entered thereon; or in other words, it is where a person has a right to lands, &c. and is by wrong disseised of them. A seisin *in law* is held to be sufficient to avow on; tho' to the bringing of an assise, actual seisin is required; and where seisin is alleged, the person pleading it must shew of what estate he is seised, &c.

Seisin of a superior service is deemed to be a seisin.

Segreant
Seisin.

fin of all superior and casual services that are incident thereto; and seisin of a lessee for years, is sufficient for him in reversion.

Livery of Seisin, in law, an essential ceremony in the conveyance of landed property; being no other than the pure feudal investiture, or delivery of corporal possession of the land or tenement. This was held absolutely necessary to complete the donation; *Nam feudum sine investitura nullo modo constitui potuit*: and an estate was then only perfect when, as Fleta expresses it in our law, *sit juris et seisinæ conjunctio*. See **FEOFFMENT**, in **APPENDIX**.

Investitures, in their original rise, were probably intended to demonstrate in conquered countries the actual possession of the lord; and that he did not grant a bare litigious right, which the soldier was ill qualified to prosecute, but a peaceable and firm possession. And, at a time when writing was seldom practised, a mere oral gift, at a distance from the spot that was given, was not likely to be either long or accurately retained in the memory of bystanders, who were very little interested in the grant. Afterwards they were retained as a public and notorious act, that the country might take notice of and testify the transfer of the estate; and that such as claimed title by other means might know against whom to bring their actions.

Blackst.
Comment.

In all well-governed nations, some notoriety of this kind has been ever held requisite, in order to acquire and ascertain the property of lands. In the Roman law, *plenum dominium* was not said to subsist, unless where a man had both the *right* and the *corporal possession*; which possession could not be acquired without both an actual intention to possess, and an actual seisin, or entry into the premises, or part of them in the name of the whole. And even in ecclesiastical promotions, where the freehold passes to the person promoted, corporal possession is required at this day, to vest the property completely in the new proprietor; who, according to the distinction of the canonists, acquires the *jus ad rem*, or inchoate and imperfect right, by nomination and institution; but not the *jus in re*, or complete and full right, unless by corporal possession. Therefore in dignities possession is given by installation; in rectories and vicarages by induction, without which no temporal rights accrue to the minister, though every ecclesiastical power is vested in him by institution. So also even in descents of lands, by our law, which are cast on the heir by act of the law itself, the heir has not *plenum dominium*, or full and complete ownership, till he has made an actual corporal entry into the lands: for if he dies before entry made, *his* heir shall not be entitled to take the possession, but the heir of the person who was last actually seised. It is not therefore only a mere right to enter, but the actual entry, that makes a man complete owner; so as to transmit the inheritance to his own heirs: *non jus, sed seisinam, facit stipitem*.

Yet, the corporal tradition of lands being sometimes inconvenient, a symbolical delivery of possession was in many cases anciently allowed; by transferring something near at hand, in the presence of credible witnesses, which by agreement should serve to represent the very thing designed to be conveyed; and an occupancy of this sign or symbol was permitted as equivalent to occupancy of the land itself. Among the

Jews we find the evidence of a purchase thus defined in the book of Ruth: "Now this was the manner in former time in Israel, concerning redeeming and concerning changing, for to confirm all things: a man plucked off his shoe, and gave it to his neighbour; and this was a testimony in Israel." Among the ancient Goths and Swedes, contracts for the sale of lands were made in the presence of witnesses, who extended the cloak of the buyer, while the seller cast a clod of the land into it, in order to give possession; and a staff or wand was also delivered from the vendor to the vendee, which passed through the hands of the witnesses. With our Saxon ancestors the delivery of a turf was a necessary solemnity to establish the conveyance of lands. And, to this day, the conveyance of our copyhold estates is usually made from the seller to the lord or his steward by delivery of a rod or verge, and then from the lord to the purchaser by re-delivery of the same in the presence of a jury of tenants.

Conveyances in writing were the last and most refined improvement. The mere delivery of possession, either actual or symbolical, depending on the ocular testimony and remembrance of the witnesses, was liable to be forgotten or misrepresented, and became frequently incapable of proof. Besides, the new occasions and necessities, introduced by the advancement of commerce, required means to be devised of charging and incumbering estates, and of making them liable to a multitude of conditions and minute designations, for the purposes of raising money, without an absolute sale of the land; and sometimes the like proceedings were found useful in order to make a decent and competent provision for the numerous branches of a family, and for other domestic views. None of which could be effected by a mere, simple, corporal transfer of the soil from one man to another, which was principally calculated for conveying an absolute unlimited dominion. Written deeds were therefore introduced, in order to specify and perpetuate the peculiar purposes of the party who conveyed: yet still, for a very long series of years, they were never made use of, but in company with the more ancient and notorious method of transfer by delivery of corporal possession.

Livery of seisin, by the common law, is necessary to be made upon every grant of an estate of freehold in hereditaments corporeal, whether of inheritance or for life only. In hereditaments incorporeal it is impossible to be made; for they are not the object of the senses; and in leases for years, or other chattel interests, it is not necessary. In leases for years indeed an actual entry is necessary, to vest the estate in the lessee: for a bare lease gives him only a right to enter, which is called his interest in the term, or *interesse termini*; and when he enters in pursuance of that right, he is then, and not before, in possession of his term, and complete tenant for years. This entry by the tenant himself serves the purpose of notoriety, as well as livery of seisin from the grantor could have done; which it would have been improper to have given in this case, because that solemnity is appropriated to the conveyance of a freehold. And this is one reason why freeholds cannot be made to commence *in futuro*, because they cannot (at the common law) be made but by livery of seisin; which livery, being an actual manual tradition

tradition of the land, must take effect *in presenti*, or not at all.

Livery of seisin is either in *deed* or in *law*.

Livery in *deed* is thus performed. The feoffor, lessor, or his attorney, together with the feoffee, lessee, or his attorney, (for this may as effectually be done by deputy or attorney, as by the principals themselves in person), come to the land or to the house; and there, in the presence of witnesses, declare the contents of the feoffment or lease on which livery is to be made. And then the feoffor, if it be of land, doth deliver to the feoffee, all other persons being out of the ground, a clod or turf, or a twig or bough there growing, with words to this effect: "I deliver these to you in the name of seisin of all the lands and tenements contained in this deed." But, if it be of a house, the feoffor must take the ring or latch of the door, the house being quite empty, and deliver it to the feoffee in the same form; and then the feoffee must enter alone, and shut the door, and then open it, and let in the others. If the conveyance or feoffment be of divers lands, lying scattered in one and the same county, then in the feoffor's possession, livery of seisin of any parcel, in the name of the rest, sufficeth for all; but if they be in several counties, there must be as many liveries as there are counties. For, if the title to these lands comes to be disputed, there must be as many trials as there are counties, and the jury of one county are no judges of the notoriety of a fact in another. Besides, anciently, this seisin was obliged to be delivered *coram paribus de vicineto*, before the peers or freeholders of the neighbourhood, who attested such delivery in the body or on the back of the deed; according to the rule of the feudal law, *Pares debent interesse investiture feudi, et non alii*: for which this reason is expressly given; because the peers or vassals of the lord, being bound by their oath of fealty, will take care that no fraud be committed to his prejudice, which strangers might be apt to connive at. And though, afterwards, the ocular attestation of the *pares* was held unnecessary, and livery might be made before any credible witnesses, yet the trial, in case it was disputed, (like that of all other attestations), was still reserved to the *pares* or jury of the county. Also, if the lands be out on lease, though all lie in the same county, there must be as many liveries as there are tenants: because no livery can be made in this case, but by the consent of the particular tenant; and the consent of one will not bind the rest. And in all these cases it is prudent, and usual, to endorse the livery of seisin on the back of the deed, specifying the manner, place, and time, of making it; together with the names of the witnesses. And thus much for livery in deed.

Livery in *law* is where the same is not made on the land, but in *sight* of it only; the feoffor saying to the feoffee, "I give you yonder land, enter and take possession." Here, if the feoffee enters during the life of the feoffor, it is a good livery, but not otherwise; unless he dares not enter, thro' fear of his life or bodily harm: and then his continual claim, made yearly in due form of law, as near as possible to the lands, will suffice without an entry. This livery in law cannot, however, be given or received by attorney, but only by the parties themselves.

SEIZE, in the sea-language, is to make fast or bind, particularly to fasten two ropes together with rope-yarn. The seizing of a boat is a rope tied to a ring or little chain in the fore-ship of the boat, by which means it is fastened to the side of the ship.

SEIZURE, in commerce, an arrest of some merchandise, moveable, or other matter, either in consequence of some law or of some express order of the sovereign. Contraband goods, those fraudulently entered, or landed without entering at all, or at wrong places, are subject to seizure. In seizures, among us, one half goes to the informer, and the other half to the king.

SELDEN (John), called by Grotius *the glory of England*, was born at Salvington in Suffex in 1584. He was educated at the free-school at Chichester; whence he was sent to Hart-Hall in the university of Oxford, where he staid four years. In 1612, he entered himself in Clifford's Inn, in order to study the law; and about two years after removed to the Inner Temple, where he soon acquired great reputation by his learning. He had already published several of his works; and this year wrote verses in Latin, Greek, and English, upon Mr William Browne's Britannia's Pastorals. In 1614, he published his *Titles of Honour*; and in 1616, his *Notes on Sir John Fortescue's book De Laudibus Legum Anglie*. In 1618, he published his *History of Tythes*; which gave great offence to the clergy, and was animadverted upon by several writers; and for that book he was called before the high-commission court, and obliged to make a public acknowledgment of his sorrow for having published it. In 1621, being sent for by the parliament, though he was not then a member of that house, and giving his opinion very strongly in favour of their privileges in opposition to the court, he was committed to the custody of the sheriff of London; but was set at liberty after five weeks confinement. In 1623, he was chosen burgess for Lancaster; but, amidst all the divisions of the nation, kept himself neuter, prosecuting his studies with such application, that though he was the next year chosen reader of Lyon's Inn, he refused to perform that office. In 1625, he was chosen burgess for Great Bedwin in Wiltshire, to serve in the first parliament of king Charles I. in which he declared himself warmly against the duke of Buckingham; and on his Grace's being impeached by the House of Commons, was appointed one of the managers of the articles against him. In 1627 and 1628, he opposed the court-party with great vigour. The parliament being prorogued to January 20. 1629, Mr Selden retired to the earl of Kent's house at Wreth, in Bedfordshire, where he finished his *Marmoræ Arundeliana*. The parliament being met, he, among others, again distinguished himself by his zeal against the court; when the king dissolving the parliament, ordered several of the members to be brought before the King's Bench bar, and committed to the Tower. Among these was Mr Selden, who insisting on the benefit of the laws, and refusing to make his submission, was removed to the King's Bench prison. Being here in danger of his life on account of the plague then raging in Southwark, he petitioned the lord high treasurer, at the end of Trinity-term, to intercede with his Majesty that he might be removed to the Gate-House, Westminster,

Selden,
Selenitzæ.

minster; which was granted: In Michaelmas term following, the judges objecting to the lord treasurer's warrant, by which he had been removed to the Gate-House, an order was made for conveying him back to the King's Bench, whence he was released in the latter end of the same year; but fifteen years after, the parliament ordered him 5000*l.* for the losses he had sustained on this occasion. He was afterwards comitted with several other gentlemen for dispersing a libel; but the author, who was abroad, being discovered, they were at length set at liberty. In 1634, a dispute arising between the English and Dutch concerning the herring-fishery on the British coast, he was prevailed upon by archbishop Laud to draw up his *Mare Clausum*, in answer to Grotius's *Mare Liberum*; which greatly recommended him to the favour of the court. In 1640, he was chosen member for the university of Oxford; when he again opposed the court, though he might, by complying, have raised himself to very considerable posts. In 1643, he was appointed one of the lay-members to sit in the assembly of divines at Westminster, and was the same year appointed keeper of the records in the Tower. In 1645, he was made one of the commissioners of the admiralty. The same year he was unanimously elected master of Trinity-college, Cambridge; but declined accepting. He died in 1654; and was interred in the Temple-church, where a monument is erected to his memory.—Dr Wilkes observes, that he was a man of uncommon gravity and greatness of soul, averse to flattery, liberal to scholars, charitable to the poor; and though he had great latitude in his principles with regard to ecclesiastical power, yet he had a sincere regard for the church of England. He wrote many learned works besides those already mentioned; the principal of which are, 1. *De Jure Naturali & Gentium juxta Disciplinam Hebræorum.* 2. *De Nuptiis & Divorciis.* 3. *De Anno Civili veterum Hebræorum.* 4. *De Nummis.* 5. *De Diis Syris.* 6. *Uxor Hebræica.* 7. *Jani Anglorum Facies altera, &c.* All his works were printed together in 1726, in 3 vols folio.

SELENITÆ, MOON-STONE, in natural history, a class of fossils, naturally and essentially simple; not inflammable, nor soluble in water; composed of slender filaments, ranged into fine and even thin flakes, and those disposed into regular figures, in the different genera, approaching to a rhomboide, a hexangular column, or a reſtangled inequilateral parallelogram; fissile like the talcs, but that not only horizontally, but perpendicularly also; flexile in a small degree, but not at all elastic; not fermenting with acid menstrua, and readily calcining in the fire.

Of this class Dr Hill makes seven orders, and under these orders ten genera. The first order is the selenitzæ, with horizontal plates, approaching to a rhomboidal form; the second order is the selenitzæ with horizontal plates, of a columnar and angular form; the third order comprehends those selenitzæ whose filaments are visibly arranged into plates, but in the whole masses appear striated, not tabulated; of the fourth order, are the flat selenitzæ, of no determinately angular figure; of the fifth order are the selenitzæ formed of plates perpendicularly arranged; of the sixth order are those selenitzæ formed of a congeries of plates, ranged in form

of a star; and of the seventh order are those selenitzæ of a complex and indeterminate figure.

This fossil is found in strata of clay, usually of the blue tough kind; we have it in many parts in England, particularly about Shotover hills in Oxfordshire; in several places of Northamptonshire, Leicestershire, and about Epsom in Surry. In medicine, it is a very powerful astringent; and is of effect in diarrhoeas, dysenteries, and hæmorrhagies. It stands also recommended as a cosmetic. The people of Northamptonshire call it *staunch*, and use it in hæmorrhagies of all kinds with success.

SELENOGRAPHY, a branch of cosmography, which describes the moon and all the parts and appearances thereof, as geography does those of the earth. See the references at MOON, and Plate XLII.

SELEUCIDÆ, in chronology. *Æra* of the Seleucidæ, or the Syro-Macedonian æra; is a computation of time, commencing from the establishment of the Seleucidæ, a race of Greek kings, who reigned as successors of Alexander the Great, in Syria, as the Ptolemies did in Egypt. This æra we find expressed in the book of the Maccabees, and on a great number of Greek medals struck by the cities of Syria, &c. The Rabbins call it the *æra of contracts*; and the Arabs, *therik dîkarnain*, that is, the “æra of the two horns.” According to the best accounts, the first year of this æra falls in the year 311 B. C. being 12 years after Alexander's death.

SELEUCUS (Nicanor), one of the chief generals under Alexander the Great, and, after his death, founder of the race of princes called *Seleucidæ*. He is equally celebrated as a renowned warrior, and as the father of his people; yet his virtues could not protect him from the fatal ambition of Ceraunus, one of his courtiers, by whom he was assassinated 280 B. C.

SELF-MURDER, the pretended heroism, but real cowardice, of the Stoic philosophers, who destroyed themselves to avoid those ills which they had not the fortitude to endure, though the attempting it seems to be countenanced by the civil law, yet was punished by the Athenian law with cutting off the hand which committed the desperate deed. And also the law of England wisely and religiously considers, that no man hath a power to destroy life but by commission from God the author of it: and as the suicide is guilty of a double offence; one spiritual, in invading the prerogative of the Almighty, and rushing into his immediate presence uncalled for; the other temporal, against the king, who hath an interest in the preservation of all his subjects; the law has therefore ranked this among the highest crimes, making it a peculiar species of felony, a felony committed on one's self. And this admits of accessories before the fact, as well as other felonies; for if one persuades another to kill himself, and he does so, the adviser is guilty of murder. *A felo de se*, therefore, is he that deliberately puts an end to his own existence, or commits any unlawful malicious act, the consequence of which is his own death: as if, attempting to kill another, he runs upon his antagonist's sword; or, shooting at another, the gun bursts and kills himself. The party must be of years of discretion, and in his senses, else it is no crime.

Seleno-
graphy
Self.

Seleucia,
Selkirkshire

Seleucia, crime. But this excuse ought not to be refrained to that length to which our coroners juries are apt to carry it, viz. that the very act of suicide is an evidence of insanity; as if every man, who acts contrary to reason, had no reason at all: for the same argument would prove every other criminal *non compos*, as well as the self-murderer. The law very rationally judges, that every melancholy or hypochondriac fit does not deprive a man of the capacity of discerning right from wrong; which is necessary to form a legal excuse. And therefore, if a real lunatic kills himself in a lucid interval, he is a *felo de se* as much as another man.

But now the question follows, What punishment can human laws inflict on one who has withdrawn himself from their reach? They can only act upon what he has left behind him, his reputation and fortune: on the former, by an ignominious burial in the highway, with a stake driven through his body; on the latter, by a forfeiture of all his goods and chattels to the king: hoping, that his care for either his own reputation, or the welfare of his family, would be some motive to refrain him from so desperate and wicked an act. And it is observable, that this forfeiture has relation to the time of the act, done in the felon's lifetime, which was the cause of his death. As if husband and wife be possessed jointly of a term of years in land, and the husband drowns himself; the land shall be forfeited to the king, and the wife shall not have it by survivorship. For by the act of casting himself into the water he forfeits the term; which gives a title to the king, prior to the wife's title by survivorship, which could not accrue till the instant of her husband's death. And tho' it must be owned that the letter of the law herein borders a little upon severity; yet it is some alleviation, that the power of mitigation is left in the breast of the sovereign, who upon this (as on all other occasions) is reminded by the oath of his office, to execute judgment in mercy.

SELEUCIA, (anc. geogr.) furnamed *Babylonia*, because situate on its confines, at the confluence of the Euphrates and Tigris. Ptolemy places it in Mesopotamia. It is called also *Seleucia ad Tigrim*, (Polybius, Strabo, Ildorus, Characenus); washed on the south by the Euphrates, on the east by the Tigris, (Theophrastus); generally agreed to have been built or enlarged by Seleucus Nicanor, master of the east after Alexander; by means of which Babylon came to be deserted. It is said to have been originally called *Cochæ*, (Ammian, Eutropius); though others, as Arrian, distinguish it, as a village, from *Seleucia*; and, according to Zosimus, the ancient name of *Seleucia* was *Zebasfa*. Now called *Bagdad*. E. Long. 44. 21. N. Lat. 33. 10. There were many other cities of the same name, all built by Seleucus Nicanor.

SELKIRKSHIRE, called also the *Sheriffdom of Ettrick Forest*, a county of Scotland, extending about 20 miles in length from east to west, and about 12 in breadth from south to north. It borders on the north with part of Tweeddale and Mid-Lothian; on the south and east with Teviotdale; and on the west with Anandale. This county was formerly reserved by the Scottish princes for the pleasure of the chase, and where they had houses for the reception of their train.

VOL. X.

Sella
Semen.

At that time the face of the country was covered with woods, in which there were great numbers of red and fallow deer, whence it had the name of *Ettrick Forest*. The woods, however, are now almost entirely cut down, and the county is chiefly supported by the breed of sheep. They are generally fold into the south, but sometimes into the Highlands, about the mouth of March, where they are kept during summer; and after being improved by the mountain-grass, are returned into the Lowlands in the beginning of winter.

SELLA TURCICA, is a deep depression between the elinoid apophyses of the sphenoid bone. See ANATOMY, n° 15, d.

SELTZER WATER, is a mineral water which springs up at Lower Seltzer, a village in the electorate of Triers, about 10 miles from Frankfort on the Mayne. It is a very useful medicinal water. It contains a very small portion of a calcareous earth, of a native mineral alkali, and an acid; but of these the quantity is too small to attribute any medicinal virtues to; but it it contains also near 1-7th of its bulk of fixed air, which is more than is found in any other mineral water, and to this it owes its principal virtues.

SEM, or **SEM**, the son of Noah, memorable for his filial piety in concealing the folly and disgrace of his father; for which he received a remarkable benediction; about 2476 B. C. He lived to the age of 600 years.

SEMEN, in botany, the **SEED**; the essence of the fruit of every vegetable; defined by Linnæus to be a deciduous part of the plant, containing the rudiments of a new vegetable, and fertilized by the asperion or sprinkling of the male-dust. The parts of a seed, properly so called, enumerated by Linnæus, are as follows: 1. **CORCULUM**, the *punctum vite*, or essence of the feed. 2. **COTYLEDONES**, the lobes. 3. **HILUM**, a mark or scar in the feed. 4. **ARILLUS**, Lin. the proper covering: *calyptra* of Tournefort. 5. **CORONULA**, PAPPUS, the crown of the feed. 6. **ALA**, the wing of the feed.

Besides the seed properly so called, two other terms are referred by Linnæus to the general article of **SEMEN**, viz. 7. **NUX**, a nut, or feed covered with a hard bony skin. 8. **PROPAG**, the feed of the moises.

With respect to number, plants are either furnished with one feed, as pea-pink and bistort; two, as wood-roof and the umbelliferous plants; three, as spurge; four, as the lip-flowers of Tournefort and rough-leaved plants of Ray; or many, as ranunculus, anemone, and poppy.

The form of seeds is likewise extremely various, being either large or small, round, oval, heart-shaped, kidney-shaped, angular, prickly, rough, hairy, wrinkled, fleck, or shining, black, white, or brown. Most seeds have only one cell, or internal cavity; those of lesser burdock, valerian, lamb's lettuce, cornelian cherry, and seabean, have two.

With respect to substance, seeds are either soft, membranaceous, or of a hard bony substance; as in gromwell, tamarind, and all the nuciferous plants.

In point of magnitude, seeds are either very large,

Semen. as in cocoa-nut; or very small, as in campanula, *anemone*, rampions, and throat-wort.

With respect to situation, they are either dispersed promiscuously through the pulp, (*semina nidulantia*), as in water-lily; affixed to a future or joining of the valves of the seed-vessel, as in the cross-shaped and pea-bloom flowers; or placed upon a *placenta*, or receptacle within the seed-vessel, as in tobacco, and thorn-apple.

Seeds are said to be naked (*semina nuda*) which are not contained in a cover, or vessel: such are those of the lip and compound flowers, the umbelliferous and rough-leaved plants; covered seeds (*semina secta*) are contained in some vessel, whether of the capsule, pod, berry, apple, or cherry kind.

A simple seed is such as bears neither crown, wing, nor downy *pappus*; the varieties in seeds, arising from these circumstances, are particularly enumerated under their respective heads.

In assimilating the animal and vegetable kingdoms, Linnæus denominates seeds the eggs of plants. The fecundity of plants is frequently marvellous; from a single plant or stalk of Indian Turkey wheat, are produced, in one summer, 2000 seeds; of elecampane, 3000; of sun-flower, 4000; of poppy, 32,000; of a spike of cat's-tail, 10,000 and upwards: a single fruit, or seed-vessel, of tobacco, contains 1000 seeds; that of white poppy, 8000. Mr Ray relates, from experiments made by himself, that 1012 tobacco-seeds are equal in weight to one grain; and that the weight of the whole quantum of seeds in a single tobacco-plant, is such as must, according to the above proportion, determine their number to be 360,000. The same author estimates the annual produce of a single stalk of spleen-wort to be upwards of one million of seeds.

The dissemination of plants respects the different methods or vehicles by which nature has contrived to disperse their seeds for the purpose of increase. These by naturalists are generally reckoned four.

1. Rivers and running waters. 2. The wind. 3. Animals. 4. An elastic spring, peculiar to the seeds themselves.

1. The seeds which are carried along by rivers and torrents are frequently conveyed many hundreds of leagues from their native soil, and cast upon a very different climate, to which, however, by degrees, they render themselves familiar.

2. Those which are carried by the wind, are either winged, as in fir-tree, trumpet-flower, tulip-tree, birch, arbor-vitæ, meadow-rue, and jessamine, and some umbelliferous plants; furnished with a *pappus*, or downy crown, as in valerian, poplar, reed, fucculent swallow-wort, cotton-tree, and many of the compound flowers; placed within a winged *calix*, or seed-vessel, as in scabious, sea-pink, dock, *diocorea*, ash, maple, and elm-trees, logwood and woad; or lastly, contained within a swelled *calix* or seed-vessel, as in winter-cherry, cucubalus, mellilot, bladder-nut, fumatory, bladder-sena, heart-feed, and chick-pease.

3. Many birds swallow the seeds of vanelloe, juniper, mistletoe, oats, millet, and other grasses, and void them entire. Squirrels, rats, parrots, and other animals, fuffer many of the seeds which they devour to escape, and thus in effect disseminate them. Moles,

ants, earth-worms, and other insects, by ploughing up the earth, admit a free passage to those seeds which have been scattered upon its surface. Again, some feeds attach themselves to animals, by means of hooks, crochets, or hairs, which are either affixed to the seeds themselves, as in hound's tongue, mouse-ear, vervain, carrot, balsam-parley, fanigie, water hemp-agrimony, *arctopus* and *terrebinth*; to their calix, as in burdock, agrimony, *rhesia*, small wild bugloss, dock, nettle, pellitory, and lead-wort; or to their fruit or seed-vessel, as in liquorice, enchanter's night-shade, cross-wort, clivers, French honeysuckle, and arrow-headed grafs.

4. The seeds which disperse themselves by an elastic force, have that force resident either in their *calix*, as in oats and the greater number of ferns; in their *pappus*, as in centaurea crupina; or in their *capsule*, as in geranium, herb-bennet, African spiræa, fraxinella, horse-tail, balsam, Malabar nut, cucumber, elaterium, and male balsam apple.

SEMEN MASCULINUM, in the animal œconomy, is a white, liquid matter or humour, the thickest of any in the body, separated from the blood in the testicles, and reserved in proper vessels, to be the means of generation. By chemical analysis it is found to consist almost entirely of oil and volatile salts blended together by the mediation of a little phlegm. See ANIMALCULE. n° 48 et seq.

SEMEDRIAHA, a town of Turkey in Europe, is the province of Servia, with a good citadel. It is the capital of a sangiacate, was taken by the Turks in 1690, and is seated on the Danube in E. Long. 21. 25. N. Lat. 45. 4.

SEMENTINÆ FERTÆ, in antiquity, feasts held annually among the Romans, to obtain of the gods a plentiful harvest. They were celebrated in the temple of Tellus, where solemn sacrifices were offered to Tellus and Ceres. These feasts were held about seed-time, usually in the month of January; for, as Macrobius observes, they were moveable feasts.

SEMI, a word borrowed from the Latin, signifying half; but only used in composition with other words, as in the following articles.

SEMICIRCLE, in geometry, half a circle, or that figure comprehended between the diameter of the circle and half its circumference.

SEMICOLON, in grammar, one of the points or stops used to distinguish the several members of a sentence from each other.

The mark or character of the semicolon is (;), and has its name as being of somewhat less effect than a colon; or as demanding a shorter pause.

The proper use of the semi-colon is to distinguish the conjunct members of a sentence. Now, by a conjunct member of a sentence is meant, such a one as contains at least two simple members.—Whenever, then, a sentence can be divided into several members of the same degree, which are again divisible into other simple members, the former are to be separated by a semi-colon. For instance: “ If fortune bear a great sway over him, who has nicely stated and concerted every circumstance of an affair; we must not commit every thing, without reserve, to fortune, lest she have too great a hold of us.” Again: *Si quantum in agro locisq; desertis audacia potest, tantum in foro aique judi-*

Semicolon
Semiramis.

Semperi
vum.

cis impudentia valerit; non minus in causa cederet Aulus Cincinnatus Sextus Æbutius impudentis, quam tum in vi facienda cessit audacis. An instance in a more complex sentence we have in Cicero: *Res familiaris primum bene parta sit, nulloque turpi questu; tum quam plurimis modo dignis, se utilem prebeat; deinde augeatur ratione, diligentia, parvissumma; nec libidini potius luxurieque, quam liberalitati & beneficentie pareat.*

But though the proper use of the semi-colon be to distinguish conjunct members, it is not necessary that all the members divided hereby be conjunct. For upon dividing a sentence into great and equal parts, if one of them be conjunct, all those other parts of the same degree are to be distinguished by a semi-colon.— Sometimes also it happens, that members that are opposite to each other, but relate to the same verb, are separated by a semi-colon. Thus Cicero: *Ex hac parte pudor, illinc petulantia; hinc fides, illinc fraudatio; hinc pietas, illinc scelus, &c.* Hither likewise may be referred such sentences, where the whole going before, the parts follow: as, “The parts of oratory are four; invention, disposition, elocution, and pronunciation.”

SEMICUPIDUM, in medicine, an half-bath, wherein the patient is only placed up to the navel.

SEMI-DIAMETER, half the diameter, or a right line drawn from the centre of a circle or sphere to its circumference; being the same with what is otherwise called the *radius*.

SEMI-FLOSCULUS, in botany, a term used to express the flowers of the *syngenesia* class. These semiflosculi are petals, hollow in their lower part, but in their upper flat, and continued in the shape of a tongue.

SEMI-PELAGIANS, in church-history, a branch of the Pelagians, so called because they pretended to keep a medium between the Pelagians and the orthodox.

SEMI-TONE, in music. See INTERVAL.

SEMINAL, something belonging to the semen or seed.

SEMINARY, in its primary sense, the ground where any thing is sown, to be afterwards transplanted.

SEMINARY, in a figurative sense, is frequently applied to places of education, whence scholars are transplanted into life.—In Catholic countries it is particularly used for a kind of college or school, where youth are instructed in the ceremonies, &c. of the sacred ministry. Of these are great numbers; it being ordained by the council of Trent, that there be a seminary belonging to each cathedral, under the direction of the bishop.

SEMINATION, denotes the manner or act of shedding and dispersing the seeds of plants. See SEMEN.

SEMI-RAMIS, a famous queen of Assyria and Babylonia, concerning whom many fables are related, and to whom the wonderful works about the city of Babylon are by many attributed. Her birth is said to have been supernatural, springing from a goddess, by name *Darceto*, who had a temple not far from Ascalon, near a fishy lake; and who is thought to have been the same with the Philistine Dagon. When Semiramis grew up, she so far exceeded all women in beauty and other qualifications, that Menon, the prime minister to Ninus king of Assyria, took her to wife. Ninus was at that time besieging the capital of Bactria

unsuccessfully; and Semiramis happening to pay a visit to her husband before the camp, put the besiegers on such an excellent plan, that the city was quickly obliged to capitulate. Ninus was so charmed with the beauty and address displayed by Semiramis on this occasion, that he soon after married her; upon which Menon her former husband killed himself. Ninus also did not long survive him, and was buried by her at a vast expence.

Semiramis, thus advanced to the imperial dignity, resolved to build the city of Babylon*; which accordingly she did in the most magnificent manner. Several other cities also she built on the banks of the Tigris and Euphrates, for the sake of commerce and communication between the remote parts of the empire. She invaded and conquered Media and Ethiopia; but having undertaken an expedition against India, was defeated, and obliged to fly, after having lost the greatest part of her army. She is said to have vanished from the sight of men, after her son Ninus had attempted to assassinate her; but most probably she was murdered by the conspirators.

SEMPERVIVUM, LIVE-EVER, or *Houfe-leek*; a genus of the *dodecandria* order, belonging to the *dodecandria* class of plants. There are twelve species, four of which are natives of Britain; all of them hardy ever-green perennials, formed of roundish clusters of succulent smooth leaves in expanded open heads, producing very spreading off-sets, and erect succulent stalks from six to twelve inches high, with flowers of a deep-red or yellow colour.—Besides these, there are two species, natives of warm countries; the *arborescens*, or tree *houfe-leek*; and the *canariensis*, or Canary shrub by *houfe-leek*. The former rises with an upright smooth fleshy stem, six or eight feet high, with the branches terminated by large clustering heads of spear-shaped bright-green leaves; and from the centre of the heads large pyramidal spikes of bright yellow flowers. There is a variety with variegated leaves and white flowers, exceedingly ornamental. The *canariensis* rises with an upright succulent rugged stalk, half a yard or more high, appearing ragged with the rudiments of past foliage, having the top crowned by large globular heads of retuse succulent leaves; and from the centre of the head a long pyramidal spike of greenish-coloured flowers.—They are all easily propagated by off-sets, cuttings, or seeds. The four hardy species will thrive on any old wall; but the other two being tender, must be sheltered in the green-house. The leaves of the common *houfe-leek* have been recommended as refrigerant, though their sensible qualities discover no great signs of any virtue of this kind; their taste being herbaceous, with a slight degree of pungency. It is remarkable of this plant, that its juice, purified by filtration, when it appears of a dilute yellowish colour, upon the admixture of an equal quantity of rectified spirit of wine, forms a beautiful white, light coagulum, like the finer kinds of pomatum, which proves extremely volatile; so that, when freed from the aqueous phlegm, and exposed to the air, it in a very little time totally exhales. Hence some have concluded that the juice contained a volatile alkaline salt; but nothing of this kind is discovered by any other trial, and there are many substances besides these salts which coagulate with spirit of wine.

* See Babel.

Sena,
Seneca.Senator
Seneca.

SENA, the leaf of the *CASSIA* *fena* of Linnæus, is very common and useful purgative. It is produced from a shrub about a foot high, growing naturally in Egypt and several parts of the Levant. The finest is that from Alexandria, called by the Turks *palte*, which pays a considerable tribute to the grand signior. The leaves are of an oblong figure, sharp-pointed at the ends, about a quarter of an inch broad, and not a full inch in length, of a lively yellowish green colour, a faint not very disagreeable smell, and a subacid, bitterish, nauseous taste. Some inferior sorts are brought from Tripoli and other places; these may be easily distinguished by their being either narrower, longer, and sharper-pointed; or larger, broader, and round-pointed, with small prominent veins; or large and obtuse, of a fresh green colour, without any yellow cast.

Sena is a very useful cathartic, operating mildly, and yet effectually; and, if judiciously dosed and managed, rarely occasioning the ill consequences which too frequently follow the exhibition of the stronger purges. The only inconveniences complained of in this drug are, its being apt to gripe, and its nauseous flavour. The griping quality depends upon a resinous substance, which, like the other bodies of this class, is naturally disposed to adhere to the coats of the intestines; the more this resin is divided by such matters as take off its tenacity, the less adhesive, and consequently the less irritating and griping it will prove; and the less it is divided, the more griping: hence *fena* given by itself, or infusions made in a very small quantity of fluid, gripe severely, and purge less than when diluted by a large portion of suitable menstruum, or divided by mixing the infusion with oily emulsions. The ill flavour of this drug is said to be abated by the greater water-hogwort; but we cannot conceive that this plant, whose smell is manifestly feid, and its taste nauseous and bitter, can at all improve those of *fena*: others recommend bohea tea, though neither has this any considerable effect. The smell of *fena* resides in its more volatile parts, and may be discharged by lightly boiling infusions of it made in water; the liquor thus freed from the peculiar flavour of the *fena*, may be easily rendered grateful to the taste, by the addition of any proper aromatic tincture or distilled water. The colleges both of London and Edinburgh, have given several very elegant infusions of this drug*. The dose of *fena* in substance is from a scruple to a dram; in infusion, from one to three or four drams.—It has been customary to reject the pedicles of the leaves of *fena* as of little or no use; Geoffroy, however, observes, that they are not much inferior in efficacy to the leaves themselves. The pods, or seed-vessels, met with among the *fena* brought to us, are by the college of Brussels preferred to the leaves; they are less apt to gripe, but proportionably less purgative.

SENATE, in general, is an assembly or council of senators; that is, of the principal inhabitants of a state, who have a share in the government.

The senate of ancient Rome is, of all others, the most celebrated. It exercised no contentious jurisdiction; but appointed judges, either from among the senators or knights, to determine processes: it also appointed governors of provinces, and disposed of the revenues of the commonwealth, &c. Yet did not the

whole sovereign power reside in the senate, since it could not elect magistrates, make laws, or decide of war and peace; in all which cases the senate was obliged to consult the people.

According to Dr Middleton, the constant and regular supply of the senate was from the annual magistrates; who, by virtue of their several offices, acquired a right to fit and vote in that assembly: the usual gradation of these offices being that of *questor*, *tribune*, of the people, *ædile*, *prætor*, and *consul*.—But though these offices gave both an immediate right, and actual entrance into the senate; yet the senatorial character was not esteemed complete, till the new senators had been enrolled by the censors, at the next general *lustrum*, or review of all the orders of the people.

The senate always met of course on the 1st of January, for the inauguration of the new consuls; and in all months, universally, there were three days, viz. the *kalends*, *nones*, and *ides*, on which it regularly met: but it always met on extraordinary occasions, when called together by *consul*, *tribune*, or *dictator*.

SENATOR, in general, denotes a member of some senate.

Among us, senator is a member of parliament. In the laws of king Edward the Confessor, we are told, that the Britons called those *senators*, whom the Saxons called afterwards *aldermen* and *borough-masters*; tho' not for their age, but their wisdom; for some of them were young men, but very well skilled in the laws. Kenulph king of the Mercians granted a charter, which ran thus, viz. *Consilio et consensu* episcoporum et senatorum *gentis sue largitus fuit dicto monasterio*, &c.

In Scotland, the lords of session are called *senators* of the college of justice.

SENATUS AUCTORITAS, a vote of the Roman senate, drawn up in the same form with a decree, but without its force, as having been hindered from passing into a decree by some of the tribunes of the people.

SENATUS-CONSULTUM, a decree of the Roman senate, pronounced on some question or point of law; which, when pronounced, made part of the Roman law.

SENECA (Lucius Annæus), a stoic philosopher, was born at Corduba in Spain, about the beginning of the Christian era, of an Equestrian family, which had probably been transplanted thither in a colony from Rome. He was the second son of Marcus Annæus Seneca, commonly called the *rhetorician*, whose remains are printed under the title of *Suasoria & Controversia, cum Declamationum excerptis*; and his youngest brother, Annæus Mela, for there were three of them, was memorable for being the father of the poet Lucan. He was removed to Rome, together with his father and the rest of his family, while he was yet in his infancy. There he was educated in the most liberal manner, and under the best masters. He learned eloquence from his father; but his genius rather leading him to philosophy, he put himself under the stoics Attalus, Sotion, and Papirius Fabianus; men famous in their way, and of whom he has made honourable mention in his writings. It is probable, too, that he travelled when he was young, since we find him, in several parts of his works, particularly in his *Questiones Naturales*, making very exact and curious

* See Pharmacology, in 320, &c.

Seneca.

rious observations upon Egypt and the Nile. But this, though entirely agreeable to his own humour, did not at all correspond with that scheme or plan of life which his father had drawn out for him; who therefore forced him to the bar, and put him upon soliciting for public employments; so that he afterwards became quaestor, praetor, and, as Lippius will have it, even consul.

In the first year of the reign of Claudius, when Julia the daughter of Germanicus was accused of adultery by Messalina, and banished, Seneca was banished too, being charged as one of the adulterers. Corsica was the seat of his exile, where he lived eight years; "happy in the midst of those things which usually make other people miserable; *inter eas res beatus, quae solent miseris facere*;" and where he wrote his books of consolation, addressed to his mother Helvia, and to his friend Polybius, and perhaps some of those tragedies which go under his name; for he says, *modo se levioribus studiis ibi oblectasse*. When Agrippina was married to Claudius, as it was upon the death of Messalina, she prevailed with the emperor to recall Seneca from banishment; and afterwards procured him to be tutor to her son Nero, whom she designed for the empire. By the bounty and generosity of his royal pupil, he acquired that prodigious wealth which rendered him in a manner equal to kings. His houses and walks were the most magnificent in Rome. His villas were innumerable: and he had immense sums of money placed out at interest in almost every part of the world. The historian Dio reports him to have had 250,000 l. Sterling at interest in Britain alone; and reckons his calling it in all at a sum, as one of the causes of a war with that nation.

All this wealth, however, together with the luxury and effeminacy of a court, does not appear to have had any ill effect upon the temper and disposition of Seneca. He continued able-minded, exact in his manners, and, above all, free from the vices so commonly prevalent in such places, flattery and ambition. "I had rather (said he to Nero) offend you by speaking the truth, than please you by lying and flattery: *maius enim veris offendere, quam placere adulando*." How well he acquitted himself in quality of preceptor to his prince, may be known from the five first years of Nero's reign, which have always been considered as a perfect pattern of good government; and if that emperor had but been as observant of his master through the whole course of it, as he was at the beginning, he would have been the delight, and not, as he afterwards proved, the curse and detestation, of mankind. But when Poppaea and Tigellinus had got the command of his humour, and hurried him into the most extravagant and abominable vices, he soon grew weary of his master, whose life must indeed have been a constant rebuke to him. Seneca, perceiving that his favour declined at court, and that he had many accusers about the prince, who were perpetually whispering in his ear the great riches of Seneca, his magnificent houses, and fine gardens, and what a favourite through means of these he was grown with the people, made an offer of them all to Nero. Nero refused to accept them: which however did not hinder Seneca from changing his way of life; for, as Tacitus relates, he "kept no more levees, declined the usual civilities which had been

Seneca,
Seneca.

paid to him, and, under a pretence of indispotion or some engagement or other, avoided as much as possible appearing in public."

Nero, in the mean time, who, as it is supposed, had dispatched Burrhus by poison, could not be easy till he had rid himself of Seneca also: for Burrhus and Seneca were, the one the manager of his military concerns, the other of his civil. Accordingly he attempted, by means of Cleonice, a freedman of Seneca, to take him off by poison; but this not succeeding, he ordered him to be put to death, upon an information that he was privy to Piso's conspiracy against his person. Not that he had any real proof of Seneca's being at all concerned in this plot, but only that he was glad to lay hold of any pretence for destroying him. He left Seneca, however, at liberty to choose his manner of dying; who caused his veins to be opened immediately.

His wife Paulina, who was very young in comparison of himself, had yet the resolution and affection to bear him company, and thereupon ordered her veins to be opened at the same time; but as Nero was not willing to make his cruelty more odious and insupportable than there seemed occasion for, he gave orders to have her death prevented: upon which her wounds were bound up, and the blood stopped, in just time enough to save her; though, as Tacitus says, she looked so miserably pale and wan all her life after, that it was easy to read the loss of her blood and spirits in her countenance. In the mean time, Seneca, finding his death slow and lingering, desired Statius Annianus his physician to give him a dose of poison, which had been prepared some time before in case it should be wanted; but this not having its usual effect, he was carried to a hot bath, where he was at length stifled with the steams. He died, as Lippius conjectures, in the 63d or 64th year of his age, and in about the 10th or 11th of Nero's reign. Tacitus, on mentioning his death, observes, that, as he entered the bath, he took of the water, and with it sprinkled some of his nearest domestics, saying, "That he offered those libations to Jupiter the Deliverer." These words are an evident proof that Seneca was not a Christian, as some have imagined him to have been; and that the 13 epistles from Seneca to St Paul, and from St Paul to Seneca, are supposititious pieces. His philosophical works are well known.

SENEGAL, or SENEGAL, a kingdom of Africa, in Negroland, seated on a river of the same name, which some suppose to be a branch of the Niger; but this is very uncertain, no European having travelled so far up as to determine this assertion. However, it overflows like the Nile, and much about the same time of the year. It is 40 days before it comes to the height; when the river overflows its banks, and the channel is difficult to find by those who go up it in boats. The French once sent 30 men up this river, who rowed 1000 miles, undergoing great hardships, inasmuch that only five returned back alive; their boat once stuck fast on the tops of trees, and they got it off with a great deal of difficulty. The kingdom of Senegal was formerly very considerable, but it is now reduced into a very narrow compass: it is populous and full of trees, but the soil is sandy and barren; for which reason they never sow till the rainy season comes on, in June, and get in their harvest in September. The French had a

fort

fort and factory in an island at the mouth of this river, and were entire masters of the gum-trade. It was called *Fort-Louis*, and was taken by the British on the 1st of May 1758, and ceded to Great Britain by the peace of 1763.

SENECHAL, (*Senechalus*.) derived from the German *sein* "a house or place," and *scale* "an officer," is a steward, and signifies one who has the dispensing of justice in some particular cases: As the high seneschal or steward of England; *seneschal de la hotel de roy*, "steward of the king's household, seneschal, or steward of courts, &c." *Co. Lit.* 61. *Croke's Jurisd.* 102. *Kitch.* 83. See **STEWARD**.

SENNERTUS (Daniel), an eminent physician, was born in 1572 at Bresslau; and in 1593 he was sent to Wittemberg, where he made a great progress in philosophy and physic. He visited the universities of Leipzig, Jena, Francfort upon the Oder, and Berlin; but soon returned to Wittemberg, where he was promoted to the degree of doctor of physic, and soon after to a professorship in the same faculty. He was the first who introduced the study of chemistry into that university; he gained a great reputation by his works and practice, and was very generous to the poor. He died of the plague at Wittemberg in 1637. He raised himself enemies by contradicting the ancients. He thought the seed of all living creatures animated; and that the soul of this seed produces organization. He was accused of impiety for asserting that the souls of beasts are not material; for this was affirmed to be the same thing with asserting that they are immortal: but he rejected this consequence.

SENONES, (anc. geog.), a people of Gallia Celtica, situate on the Sequana to the south of the Parisii, near the confluence of the Jeuna or Yonne with the above-mentioned river. Their most considerable exploit was their invasion of Italy, and taking and burning **ROME**, as related under that article. This was done by a colony of them long before transported into Italy, and settled on the Adriatic. Their capital, Agendicum in Gaul, was in the lower age called *Senones*, now *Sens*. In Italy the Senones extended themselves as far as the river Aesis; but were afterwards driven beyond the Rubicon, which became the boundary of Gallia Cisalpina, (Polybius, Strabo.)

SENSATION, in philosophy, the perception of external object by means of the senses. See **METAPHYSICS**, n° 21, &c.

SENSE, a faculty of the soul whereby it perceives external objects by means of the impressions they make on certain organs of the body. These organs of sensation are commonly reckoned five, *viz.* the eye, whereby we see objects; the ear, which enables us to hear sounds; the nose, by which we receive the ideas of different smells; the palate, by which we judge of tastes; and the cutis or skin, which enables us to feel the different forms, hardnesses, or softness of bodies.

SENSIBLE NOTE, in music, is that which constitutes a third major above the dominant, and a semitone beneath the tonic. *Si*, or *B*, is the sensible note in the tone of *ut* or *C sol* ♯; or *G* sharp, in the tone of *la* or *A*.

They call it the *sensible note* on this account, that it causes to be perceived the tone or natural series of the key and the tonic itself, upon which, after the chord

of the dominant, the sensible note taking the shortest road, is under a necessity of rising; which has made some authors treat this sensible note as a major dissonance, for want of observing, that dissonance, being a relation, cannot be constituted unless by two notes between which it subsists,

It is not meant that the sensible note is the seventh of the tone, because, in the minor mode, this seventh cannot be a sensible note but in ascending; for, in descending, it is at the distance of a full note from the tonic, and of a third minor from the dominant.

SENSITIVE PLANT. See **MIMOSA** and **DIONÆA Muscipula**.

The sensitive and humble plants are arranged by Linnæus under the same genus with the acacias. These are well known to possess a kind of muscular motion, by which the leaves and stalks are contracted and fall down upon being slightly touched, or shaken with some degree of violence. The sensibility of these plants is lodged in the young branches, in the common foot-stalk of the winged leaves, and in the nerve or middle rib to which the lobes or lesser leaves are attached. These different motions, which seem to be totally independent of each other, may be aptly enough compared, by analogy, with the irritability of certain parts in animals.

The sensitive plant has two kinds of motion; the one natural, occasioned by the action of warm nourishing vapours; the other artificial, in consequence of being touched or shaken.

Mr Duhamel having observed, about the 15th of September, in moderate weather, the natural motion of a branch of sensitive plant, remarked, that at nine in the morning, it formed with the stem an angle of 100 degrees; at noon, 112 degrees; at three afternoon, it returned to 100; and after touching the branch, the angle was reduced to 90. Three quarters of an hour after, it had mounted to 112; and, at eight at night, it descended again, without being touched, to 90. The day after, in finer weather, the same branch, at eight in the morning, made an angle of 135 degrees with the stem; after being touched, the angle was diminished to 80; an hour after, it rose again to 135; being touched a second time, it descended again to 80; an hour and a half after, it had risen to 145; and upon being touched a third time, descended to 135; and remained in that position till five o'clock in the afternoon; when being touched a fourth time, it fell to 110.

With whatever body the sensitive plant is touched or irritated, it is remarkable that the sensibility resides particularly in the articulation or joining either of the branches of the common foot-stalk, or of the particular foot-stalk of each wing.

The time which a branch requires to recover itself after being touched, varies according to the vigour of the plant, the hour of the day, the season of the year, or the heat and other circumstances of the atmosphere.

The order in which the parts recover themselves varies in like manner: Sometimes it is the common foot-stalk; sometimes the rib to which the lobes are attached; and sometimes the lobes themselves are expanded, before the other parts have made any attempt to be reinked in their former position.

If, without shaking the other smaller leaves, we cut

Milne's
Nat. Hist.

off the half of a lobe belonging to the last pair, at the extremity or summit of a wing, the leaf cut, and its antagonit, that is to say, the first pair, begin to approach each other; then the second; and soon successively, till all the lesser leaves, or lobes of that wing, have collapsed in like manner. Frequently, after 12 or 15 seconds, the lobes of the other wings which were not immediately affected by the stroke, shut; whilst the stalk and its wing, beginning at the bottom, and proceeding in order to the top, gradually recover themselves. If, instead of one of the lesser extreme leaves, we cut off one belonging to the pair that is next the foot-stalk, its antagonit shuts, as do the other pairs successively, from the bottom to the top. If all the lobes of one side of a wing be cut off, the opposite lobes are not affected, but remain expanded. With some address, it is possible even to cut off a branch without hurting the leaves or making them fall. The common foot-stalk of the winged leaves being cut as far as three-fourths of its diameter, all the parts which hang down collapse, but quickly recover without appearing to have suffered any considerable violence by the shock. An incision being made into one of the principal branches, to the depth of one half the diameter, the branches situated betwixt the section and the root will fall down; those above the incision remain as before, and the lesser leaves continue open; but this direction is soon destroyed, by cutting off one of the lobes at the extremity, as was observed above. Lastly, a whole wing being cut off with precaution near its insertion into the common foot-stalk, the other wings are not affected by it, and its own lobes do not shut. No motion, likewise, ensues from piercing the branch with a needle or other sharp instrument.

From the preceding experiments, to omit many others which might be mentioned, these inferences are clearly to be deduced. 1. That when the plant is in its greatest vegetative force, its motions are greater and more sensible. 2. That when the sky is serene, and the sun bright during the whole day, the plant is more sensible in the morning than at noon. 3. That in the circumstances in which they are less sensible, the leaves continue to fold and collapse, although the foot-stalks, which through age become stiff and woody, have lost their motion. 4. That a stroke, or an irritation, produces a more forcible effect than an incision or even an entire section. 5. That a slight irritation only acts upon the neighbouring parts, and extends its influence in proportion to its force. 6. That any given irritation acts more strongly upon some parts than on others. 7. That whatever can produce any effect upon the organs of animals, acts upon the sensitive plant; as a stroke, excess of heat or cold, the steam of boiling water, that of sulphur and volatile spirits, &c. 8. That plunging it in water, or lodging it in the exhausted receiver of an air-pump, seem to have no other effect than that of diminishing its vigour. 9. That there appears to be no more intimate a communication betwixt the opposite lobes of a winged or pinnated leaf, than betwixt the other parts of the plant. 10. That the muscular motion of the sensitive plant is owing to a strong contraction: each foot-stalk seems to be terminated with a kind of joint, on which the leaves turn in all directions with surprising facility.

Different from all the kinds of sensitive plants hi-

ther to known, is the *dionea muscipula*, or Venus's mousetrap, a plant lately discovered in the swamps of North America; for a description of which, see *DIONEA Muscipula*.—The negroes in Senegal call a large species of sensitive plant which grows in that country, *guerackiao*, that is, “good-morrow;” because, say they, when you touch it, or draw near to speak to it, the plant immediately inclines its leaves, to wish you, as it were, a good-morrow, and to show you that it is sensible of the politeness done it. In the same country is produced a small sensitive plant, that is rampant, not spinous, and which Mr Adanson affirms to be infinitely more delicate and sensible than all the other species.

To conclude, the cause of this and the other motions of plants is merely external. The motions themselves, therefore, are not spontaneous as in perfect animals, which have that cause dependent on their choice and will. How many imperfect animals, however, are there, such as those in animal and vegetable infusions, the polypes and animalcules in feed, whose certain motions, like those of the plants in question, are perhaps to be attributed to heat, light, and other external causes? and again, how many, as the gall-insects, the oyster, and other shell-fish, have not a motion so perceptible nor rapid as that of Venus's mousetrap and the sensitive plant!

SENTENCE, in law, a judgment passed in court by the judge on some process, either civil or criminal. See JUDGMENT.

SENTENCE, in grammar, denotes a period; or a set of words comprehending some perfect sense or sentiment of the mind.

The business of pointing is to distinguish the several parts and members of sentences, so as to render the sense thereof the clearest, aptest, and fullest possible. See PUNCTUATION.

In every sentence there are two parts necessarily required; a noun for the subject, and a definite verb; whatever is found more than these two, affects one of them, either immediately, or by the intervention of some other, whereby the first is affected.

Again, every sentence is either simple or conjunct: a simple sentence is that consisting of one single subject, and one finite verb.—A conjunct sentence contains several subjects and finite verbs, either expressly or implicitly.

A simple sentence needs no point or distinction; only a period to close it: as, “A good man loves virtue for itself.”—In such a sentence, the several adjuncts affect either the subject or the verb in a different manner. Thus the word *good*, expresses the quality of the subject, *virtue* the object of the action, and *for itself* the end thereof.—Now none of these adjuncts can be separated from the rest of the sentence: for if one be, why should not all the rest? and if all be, the sentence will be minced into almost as many parts as there are words.

But if several adjuncts be attributed in the same manner either to the subject or the verb, the sentence becomes conjunct, and is to be divided into parts.

In every conjunct sentence, as many subjects, or as many finite verbs as there are, either expressly or implied, so many distinctions may there be. Thus, “My hopes, fears, joys, pains, all centre in you.” And thus Cicero.

Cicero, *Catilina abiit, excessit, evasit, erupit.*—The reason of which pointing is obvious; for as many subjects or finite verbs as there are in a sentence, so many members does it really contain. Whenever, therefore, there occur more nouns than verbs, or contrariwise, they are to be conceived as equal. Since, as every subject requires its verb, so every verb requires its subject, wherewith it may agree: excepting, perhaps, in some figurative expressions.

SENTENCE, is also used, in rhetoric and poetry, for a short pithy remark, or reflection, containing some sentiment of use in the conduct of life. See *APHORISME, ADAGE, PROVERB, &c.*

SENTICOSÆ, (from *sentis*, a "briar or bramble;") the name of the 35th order in Linnæus's fragments of a natural method, consisting of rose, bramble, and other plants which resemble them in port and external structure. See *BOTANY*, p. 1312.

SENTIMENT, according to Lord Kaimes, is a term appropriated to such thoughts as are prompted by passion. It differs from a perception; for a perception signifies the act by which we become conscious of external objects. It differs from consciousness of an internal action, such as thinking, suspending thought, inclining, resolving, willing, &c. And it differs from the conception of a relation among objects; a conception of that kind being termed *opinion*.

Elements of
Criticism.

SENTIMENTS, in poetry. To talk in the language of music, each passion hath a certain tone, to which every sentiment proceeding from it ought to be tuned with the greatest accuracy: which is no easy work, especially where such harmony ought to be supported during the course of a long theatrical representation. In order to reach such delicacy of execution, it is necessary that a writer assume the precise character and passion of the personage represented; which requires an uncommon genius. But it is the only difficulty; for the writer, who annihilating himself, can thus become another person, need be in no pain about the sentiments that belong to the assumed character: these will flow without the least study, or even preconception; and will frequently be as delightfully new to himself as to his reader. But if a lively picture even of a single emotion, require an effort of genius, how much greater the effort to compose a passionate dialogue with as many different tones of passion as there are speakers? With what ductility of feeling must that writer be endued, who approaches perfection in such a work; when it is necessary to assume different and even opposite characters and passions, in the quickest succession? Yet this work, difficult as it is, yields to that of composing a dialogue in genteel comedy, exhibiting characters without passion. The reason is, that the different tones of character are more delicate, and less in sight, than those of passion; and, accordingly, many writers, who have no genius for drawing characters, make a shift to represent, tolerably well, an ordinary passion in its simple movements. But of all works of this kind, what is truly the most difficult, is a characteristical dialogue upon any philosophical subject: to interweave characters with reasoning, by suiting to the character of each speaker a peculiarity not only of thought but of expression, requires the perfection of genius, taste, and judgment.

How hard dialogue-writing is, will be evident, even

without reasoning, from the miserable compositions of Sentiments that kind found without number in all languages. The art of mimicking any singularity in gesture or in voice, is a rare talent, though directed by sight and hearing, the acutest and most lively of our external senses: how much more rare must that talent be, of imitating characters and internal emotions, tracing all their different tints, and representing them in a lively manner by natural sentiments properly expressed? The truth is, such execution is too delicate for an ordinary genius; and for that reason the bulk of writers, instead of expressing a passion as one does who feels it, content themselves with describing it in the language of a spectator. To awake passion by an internal effort merely, without any external cause, requires great sensibility; and yet that operation is necessary, not less to the writer than to the actor: because none but those who actually feel a passion can represent it to the life. The writer's part is the more complicated: he must add composition to passion; and mult, in the quickest succession, adopt every different character. But a very humble flight of imagination may serve to convert a writer into a spectator, so as to figure, in some obscure manner, an action as passing in his sight and hearing. In that figured situation, being led naturally to write like a spectator, he entertains his readers with his own reflections, with cool description, and florid declamation; instead of making them eye-witnesses, as it were, to a real event, and to every movement of genuine passion. Thus most of our plays appear to be cast in the same mould; personages without character, the mere outlines of passion, a tiresome monotony, and a pompous declamatory style.

This descriptive manner of representing passion is a very cold entertainment; our sympathy is not raised by description; we must first be lulled into a dream of reality, and every thing must appear as passing in our sight. Unhappy is the player of genius who acts a part in what may be termed a *descriptive tragedy*: after assuming the very passion that is to be represented, how is he cramped in action, when he must utter, not the sentiments of the passion he feels, but a cold description in the language of a bystander? It is that imperfection, undoubtedly, in the bulk of our plays, which confines our stage almost entirely to Shakespeare, notwithstanding his many irregularities. In our late English tragedies, we sometimes find sentiments tolerably well adapted to a plain passion: but we must not in any of them expect a sentiment expressive of character; and, upon that very account, our late performances of the dramatic kind are for the most part intolerably insipid.

But it may be proper to illustrate this subject by examples. The first examples shall be of sentiments that appear the legitimate offspring of passion; to which shall be opposed what are descriptive only, and illegitimate: and in making this comparison, the instances shall be borrowed from Shakespeare and Corneille, who for genius in dramatic composition stand uppermost in the rolls of fame.

I. Shakespear shall furnish the first example, being of sentiments dictated by a violent and perturbed passion:

Learn. ————— Filial ingratitude!

It

Sentiments. Is it not as if this mouth should tear this hand
For lifting food to't?—But I'll punish home;
No, I will weep no more.—In such a night,
To shut me out!—Pour on, I will endure.
In such a night as this! O Regan, Gonerill,
Your old kind father, whose frank heart gave all—
O! that way madness lies; let me shun that;
No more of that.

Kent. Good, my lord, enter here.

Lear. Pr'ythee, go in thyself, seek thine own ease,
This tempest will not give me leave to ponder
On things would hurt me more:—but I'll go in;
In, boy, go first. You houseless poverty—
Nay, get thee in; I'll pray, and then I'll sleep—
Poor naked wretches, wheresoe'er you are,
That bide the pelting of this pitiless storm!
How shall your houseless heads, and unfed sides,
Your loop'd and window'd raggedness defend you
From seasons such as these?—O I have ta'en
Too little care of this! take physic, Pomp;
Expose thyself to feel what wretches feel,
That thou may'st shake the superflux to them,
And show the heavens more just.

King Lear, act 3. sc. 5.

The following is an example of the same kind, expressing sentiments arising from remorse and despair:

Othello. Lo! I have a weapon:
A better never did itself sustain
Upon a soldier's thigh. I've seen the day,
That with this little arm, and this good sword,
I've made my way through more impediments
Than twenty times your stop. But, oh vain boast!
Who can control his fate? 'tis not so now.
Be not afraid, though you do see me weapon'd;
Here is my journey's end, here is my butt,
The very sea-mark of my utmost fail.
Do you go back dismay'd? 'tis a lost fear.
Man but a rush against Othello's breast,
And he retires. Where should Othello go?
Now—how dost thou look now! Oh ill-tarr'd wench!
Pale as thy cheek! when we shall meet at compt,
This look of thine will hurl my soul from heav'n,
And fiends will snatch at it. Cold, cold, my girl;
Ev'n like thy chastity. O cursed slave!
Whip me, ye devils,
From the possession of this heav'nly sight:
Blow me about in winds, roast me in sulphur,
Wash me in sleep-down gulfs of liquid fire—
Oh, Desdemona! Desdemona! dead! dead! oh! oh!

Othello, act 5. sc. 9.

The sentiments here displayed flow so naturally from the passions represented, that we cannot conceive any imitation more perfect.

With regard to the French author, truth obliges us to acknowledge, that he describes in the style of a spectator, instead of expressing passion like one who feels it; which naturally betrays him into a tiresome monotony, and a pompous declamatory style. It is scarce necessary to give examples, for he never varies from that tone. We shall, however, take two passages at a venture, in order to be confronted with those transcribed above. In the tragedy of *Cinna*, *Æmilia*, after the conspiracy was discovered, having nothing in view but racks and death to herself and her lover, receives

Vol. X.

1

a pardon from Augustus, attended with the brightest circumstances of magnanimity and tenderness. This is a lucky situation for representing the passions of surprise and gratitude in their different stages, which seem naturally to be what follow. These passions, raised at once to the utmost pitch, and being at first too big for utterance, must, for some moments, be expressed by violent gestures only: so soon as there is vent for words, the first expressions are broken and interrupted: at last, we ought to expect a tide of intermingled sentiments, occasioned by the fluctuation of the mind between the two passions. *Æmilia* is made to behave in a very different manner: with extreme coolness she describes her own situation, as if she were merely a spectator; or rather the poet takes the talk off her hands:

Et je me rends, Seigneur, à ces hautes bontés:
Je recouvre la vie auprès de leurs clartés.
Je connois mon forfait qui me sembloit justice;
Et ce que n'avoit pu la terreur du supplice,
Je sens naître en mon ame un repentir puissant,
Et mon cœur en secret me dit, qu'il y consent.
Le ciel a résolu votre grandeur suprême;
Et pour preuve, Seigneur, je n'en veux que moi-même.
J'ose avec vanité me donner cet éclat,
Puisqu'il change mon cœur, qu'il veut changer l'état.
Ma haine va mourir, que j'ai crue immortelle;
Elle est morte, et ce cœur devient sujet fidele;
Et prenant désormais cette haine en horreur,
L'ardeur de vous servir succède à sa fureur.

Act 5. sc. 3.

In the tragedy of *Sertorius*, the queen, surprised with the news that her lover was assassinated, instead of venting any passion, degenerates into a cool spectator, and undertakes to instruct the bystanders how a queen ought to behave on such an occasion.

Viriate. Il m'en fait voir ensemble, et l'auteur, et la cause.

Par cet assassinat c'est de moi qu'on dispose,
C'est mon trône, c'est moi qu'on pretend conquerir;
Et c'est mon juste choix qui seul l'a fait perir.
Madame, après sa perte, et parmi ces alarmes,
N'attendez point de moi de soupirs, ni de larmes;
Ce sont amulemens que dédaigne aisément
Le prompt et noble orgueil d'un vif ressentiment.
Qui pleure, l'effoiblit; qui soupire, l'exhale:
Il faut plus de fierté dans une ame royale;
Et ma douleur fourmisse aux soins de le venger, &c.

Act 5. sc. 3.

So much in general upon the genuine sentiments of passion. We proceed to particular observations. And, first, passions seldom continue uniform any considerable time: they generally fluctuate, swelling and subsiding by turns, often in a quick succession; and the sentiments cannot be just unless they correspond to such fluctuation. Accordingly, a climax never shows better than in expressing a swelling passion: the following passages may suffice for an illustration.

Oroonoko. ———Can you raise the dead?
Pursue and overtake the wings of time?
And bring about again the hours, the days,
The years, that made me happy!

Oroonoko, act 2. sc. 2.

Almeria. ———How hast thou charm'd

40 K

The

Sentiments.

The wildness of the waves and rocks to this;
That thus relenting they have giv'n thee back
To earth, to light and life, to love and me?

Mourning Bride, act 1. sc. 7.

I would not be the villain that thou think'st
For the whole space that's in the tyrant's grasp,
And the rich earth to boot.

Macbeth, act 4. sc. 4.

The following passage expresses finely the progress of conviction.

Let me not stir, nor breathe, lest I dissolve
That tender, lovely form, of painted air,
So like Almeria. Ha! it sinks, it falls;
I'll catch it ere it goes, and grasp her shade.
'Tis life! 'tis warm! 'tis she! 'tis she herself!
It is Almeria! 'tis, it is my wife!

Mourning Bride, act 2. sc. 6.

In the progress of thought, our resolutions become more vigorous as well as our passions.

If ever I do yield or give consent,
By any action, word, or thought, to wed
Another lord; may then just heav'n show'r down, &c.

Mourning Bride, act 1. sc. 1.

And this leads to a second observation, That the different stages of a passion, and its different directions, from birth to extinction, must be carefully represented in their order; because otherwise the sentiments, by being misplaced, will appear forced and unnatural. Repentment, for example, when provoked by an atrocious injury, discharges itself first upon the author: sentiments therefore of revenge come always first, and must in some measure be exhausted before the person injured think of grieving for himself. In the *Cid* of Corneille, Don Diegue having been affronted in a cruel manner, expresses scarce any sentiment of revenge, but is totally occupied in contemplating the low situation to which he is reduced by the affront:

O rage! ô desespoir! ô vieillesse ennemie!
N'ai-je donc tant vécu que pour cette infamie?
Et ne suis-je blanchi dans les travaux guerriers,
Que pour voir en un jour flétrir tant de lauriers?
Mon bras, qu'avec respect tout l'Espagne admire,
Mon bras, qui tant de fois a sauvé cet empire,
Tant de fois affermi le trône de son Roi,
Trahit donc ma querelle, et ne fait rien pour moi!
O cruel souvenir de ma gloire passée!
Oeuvre de tant de jours en un jour effacée!
Nouvelle dignité fatale à mon bonheur!
Précipice élevé d'où tombe mon honneur!
Faut-il de votre éclat voir triompher le comte,
Et mourir sans vengeance, ou vivre dans la honte?
Comme, fois de mon prince à présent gouverneur,
Ce haut rang n'admet point un homme sans honneur;
Et ton jaloux orgueil par cet affront insigne,
Malgré le chioix du Roi, m'en a fait rendre indigne.
Et toi, de mes exploits glorieux instrument,
Mais d'un corps tout de glace inutile ornement,
Fer jadis tant à craindre, et qui dans cette offense,
M'as servi de parade, et non pas de défense,
Va, quitte désormais le dernier des humains,
Passe pour me venger en de meilleures mains.

Le Cid, act 1. sc. 7.

These sentiments are certainly not the first that are

suggested by the passion of resentment. As the first movements of resentment are always directed to its object, the very same is the case of grief. Yet with relation to the sudden and severe distemper that seized Alexander bathing in the river Cydnus, Quintus Curtius describes the first emotions of the army as directed to themselves, lamenting that they were left without a leader, far from home, and had scarce any hopes of returning in safety: their king's distress, which must naturally have been their first concern, occupies them but in the second place according to that author. In the *Aminta* of Tasso, Sylvia, upon a report of her lover's death, which she believed certain, instead of bemoaning the loss of her beloved, turns her thoughts upon herself, and wonders her heart does not break:

Ohime, ben son di fallo,
Poi che questa novella non m'uccide. *Act 4. sc. 2.*

In the tragedy of *Jane Shore*, Alicia, in the full purpose of destroying her rival, has the following reflection:

Oh Jealousy! thou bane of pleasing friendship,
Thou worst invader of our tender bosoms;
How does thy rancour poison all our softness,
And turn our gentle nature into bitterness!
See where she comes! Once my heart's dearest blessing,
Now my chang'd eyes are blighted with her beauty,
Loathe that known face, and sicken to behold her.

Act 3. sc. 1.

These are the reflections of a cool spectator. A passion, while it has the ascendant, and is freely indulged, suggests not to the person who feels it any sentiment to its own prejudice: reflections like the foregoing occur not readily till the passion has spent its vigour.

A person sometimes is agitated at once by different passions; and the mind in that case, vibrating like a pendulum, vents itself in sentiments that partake of the same vibration. This we give as a third observation:

Queen. Would I had never trod this English earth,
Or felt the flatteries that grow upon it!
Ye've angels faces, but heav'n knows your hearts.
What shall become of me now? wretched lady!
I am the most unhappy woman living.
Alas! poor wenches, where are now your fortunes?

[To her women.]

Shipwreck'd upon a kingdom, where no pity,
No friends, no hope, no kindred, weep for me!
Almost, no grave allow'd me.

Henry VIII. act 3. sc. 1.

Othello. Oh devil, devil!

If that the earth could teem with woman's tears,
Each drop she falls would prove a crocodile.
Out of my sight!

Desdemona. I will not stay to offend you. *[Going.]*

Lodovico. Truly, an obedient lady:

I do beseech your lordship, call her back.

Oth. Mistress—

Des. My lord.

Oth. What would you wish with her, Sir?

Lod. Who, I, my lord?

Oth. Ay; you did wish that I would make her turn:
Sir, she can turn and turn, and yet go on;
And turn again. And she can weep, Sir, weep;
And she's obedient: as you say, obedient:

Very

Sentiments. Very obedient—proceed you in your tears—
Concerning this, Sir,—oh well-painted passion!—
I am commanded home—get you away,
I'll send for you anon—Sir, I obey the mandate,
And will return to Venice.—Hence, avant!

[Exit Delfemona.

Othello, act 4. sc. 6.

Emilia. Oh! my good lord, I would speak a word with you.

Othello. Yes, 'tis Emilia—By and by.—She's dead.
'Tis like she comes to speak of Cassio's death;
The noise was high.—Ha! no more moving?
Still as the grave. Shall she come in? were't good?
I think she stirs again—No—what's the best?
If she come in, she'll, sure, speak to my wife:
My wife! my wife! What wife? I have no wife;
Oh insupportable! oh heavy hour!

Othello, act 5. sc. 7.

A fourth observation is, That nature, which gave us passions, and made them extremely beneficial when moderate, intended undoubtedly that they should be subjected to the government of reason and conscience. It is therefore against the order of nature, that passion in any case should take the lead in contradiction to reason and conscience: such a state of mind is a sort of anarchy which every one is ashamed of, and endeavours to hide or dissemble. Even love, however laudable, is attended with a conscious shame when it becomes immoderate: it is covered from the world, and disclosed only to the beloved object:

Et quel l'amour souvent de remors combattu
Paroisse une foiblesse, et non une vertu.

Boileau, l'Art poet. chant. 3. l. 101.

O, they love least that let men know they love.

Two Gentlemen of Verona, act 1. sc. 3.

Hence a capital rule in the representation of immoderate passions, that they ought to be hid or dissembled as much as possible. And this holds in an especial manner with respect to criminal passions: one never counsels the commission of a crime in plain terms; guilt must not appear in its native colours, even in thought; the proposal must be made by hints, and by representing the action in some favourable light. Of the propriety of sentiment upon such an occasion, Shakespeare, in the Tempest, has given us a beautiful example, in a speech by the usurping duke of Milan, advising Sebastian to murder his brother the king of Naples:

Antonio. —————What might,

Worthy Sebastian,—O, what might—no more.

And yet, methinks, I see it in thy face

What thou shouldst be: the occasion speaks thee, and
My strong imagination sees a crown
Dropping upon thy head.

Act 2. sc. 1.

There cannot be a finer picture of this kind, than that of king John soliciting Hubert to murder the young prince Arthur:

K. John. Come hither, Hubert. O my gentle Hubert,
We owe thee much; within this wall of flesh
There is a soul counts thee her creditor,
And with advantage means to pay thy love.
And, my good friend, thy voluntary oath
Lives in this bosom, dearly cherished.

Give me thy hand, I had a thing to say—
But I will fit it with some better time.
By heav'n, Hubert, I'm almost afraid
To say what good respect I have of thee.
Hubert. I am much bounden to your majesty.
K. John. Good friend, thou hast no cause to say so

Sentiments.

Yet it shall come for me to do thee good.
I had a thing to say—but, let it go:
The sun is in the heav'n, and the proud day,
Attended with the pleasures of the world,
Is all too wanton and too full of gauds
To give me audience. If the midnight-bell
Did with his iron-tongue and brazen mouth
Sound one into the drowsy race of night;
If this flame were a church-yard where we stand,
And thou possessed with a thousand wrongs;
Or if that surly spirit Melancholy
Had bak'd thy blood, and made it heavy-thick,
Which else runs tickling up and down the veins,
Making that idiot Laughter keep men's eyes,
And strain their cheeks to idle merriment,
(A passion hateful to my purposes);
Or if that thou couldst see me without eyes,
Hear me without thine ears, and make reply
Without a tongue, using conceit alone,
Without eyes, ears, and harmful sounds of words;
Then, in despite of broad-ey'd watchful day,
I would into thy bosom pour my thoughts.
But ah, I will not.—Yet I love thee well;
And, by my troth, I think thou lov'st me well.

Hubert. So well, that what you bid me undertake,
Though that my death were adjunct to my act,
By heav'n, I'd do't.

K. John. Do not I know thou would'st?
Good Hubert, Hubert, Hubert, throw thine eye
On yon young boy. I'll tell thee what, my friend;
He is a very serpent in my way.
And, where'er this foot of mine doth tread,
He lies before me. Doit thou understand me?
Thou art his keeper.

King John, act 3. sc. 5.

II. As things are best illustrated by their contraries, we proceed to faulty sentiments, disdaining to be indebted for examples to any but the most approved authors. The first class shall consist of sentiments that accord not with the passion; or, in other words, sentiments that the passion does not naturally suggest. In the second class, shall be ranged sentiments that may belong to an ordinary passion, but unsuitable to it as tainted by a singular character. Thoughts that properly are not sentiments, but rather descriptions, make a third. Sentiments that belong to the passion represented, but are faulty as being introduced too early or too late, make a fourth. Vicious sentiments exposed in their native dress, instead of being concealed or disguised, make a fifth. And in the last class shall be collected sentiments suited to no character nor passion, and therefore unnatural.

The first class contains faulty sentiments of various kinds, which we shall endeavour to distinguish from each other.

1. Sentiments that are faulty by being above the tone of the passion:

Obello. — O my soul's joy !

If after every tempest come such calms,
May the winds blow till they have waken'd death :
And let the labouring bark climb hills of seas
Olympus high, and duck again as low
As hell's from heaven ? *Obello, act. 2. sc. 6.*

This sentiment may be suggested by violent and inflamed passion ; but is not suited to the satisfaction, however great, that one feels upon escaping danger.

Philaster. Place me, some god, upon a pyramid
Higher than hills of earth, and lend a voice
Loud as thy thunder to me, that from thence
I may discourse to all the under-world
The worth that dwells in him.

Philaster of Beaumont and Fletcher, act 4.
2. Sentiments below the tone of the passion. Ptolemy, by putting Pompey to death, having incurred the displeasure of Cæsar, was in the utmost dread of being dethroned : in that agitating situation, Cornelle makes him utter a speech full of cool reflection, that is in no degree expressive of the passion.

Ah ! si je t'avois crû, je n'aurois pas de maître,
Je serois dans le trône où le ciel m'a fait naître ;
Mais c'est une imprudence assez commune aux rois,
D'écouter trop d'avis, et se tromper au choix.
Le Destin les aveugle au bord du précipice,
Ou si quelque lumière en leur ame se glisse,
Cette fausse clarté dont il les éblouit,
Le plonge dans une gouffre, et puis s'évanouit.

La mort de Pompé, act 4. sc. 1.
In *Les Freres Ennemis* of Racine, the second act is opened with a love-scene : Hemon talks to his mistress of the torments of absence, of the lustre of her eyes, that he ought to die nowhere but at her feet, and that one moment of absence is a thousand years. Antigone on her part acts the coquette ; pretends that he must be gone to wait on his mother and brother, and cannot stay to listen to her courtship. This is odious French gallantry, below the dignity of the passion of love : it would scarce be excusable in painting modern French manners ; and is insufferable where the ancients are brought upon the stage. The manners painted in the *Alexandre* of the same author are not more just : French gallantry prevails there throughout.

3. Sentiments that agree not with the tone of the passion ; as where a pleasant sentiment is grafted upon a painful passion, or the contrary. In the following instances the sentiments are too gay for a serious passion.

No happier task these faded eyes pursue ;
To read and weep is all they now can do.

Eloisa to Abelard, l. 47.

Again,
Heav'n first taught letters for some wretch's aid,
Some banish'd lover, or some captive maid :
They live, they speak, they breathe what love inspires,
Warm from the soul, and faithful to its fires ;
The virgin's wish without her fears impart,
Excuse the blush, and pour out all the heart ;
Speed the soft intercourse from soul to soul,
And waft a sigh from Indus to the pole.

Eloisa to Abelard, l. 51.

These thoughts are pretty : they suit Pope, but not *Sentiments* Eloisa.

Satan, enraged by a threatening of the angel Gabriel, answers thus :

Then when I am thy captive, talk of chains,
Proud liminary clerb ; but ere then
Far heavier load thyself expect to feel
From my prevailing arm, though heaven's King
Ride on thy wings, and thou with thy compeers,
Us'd to the yoke, draw'st his triumphant wheels
In progress thro' the road of heav'n *star-pav'd.*

Paradise Lost, book 4.

The concluding epithet forms a grand and delightful image, which cannot be the genuine offspring of rage.

4. Sentiments too artificial for a serious passion. The first example is a speech of Piercy expiring.

O, Harry, thou hast robb'd me of my growth :
I better brook the loss of brittle life,
Than those proud titles thou hast won of me ; [sleth.
They wound my thoughts, worse than thy sword my
But thought's the slave of life, and life time's fool ;
And time, that takes survey of all the world,
Must have a stop.

First Part, Henry IV. act 5. sc. 9.

Livy inserts the following passage in a plaintive oration of the Locrenses, accusing Plerninus the Roman legate of oppression.

In hoc legato vestro, nec hominis quicquam est, Patres Conscripti, præter figuram et speciem ; neque Romani civis, præter habitum vestitumque, et sonum linguæ Latinæ. Pectus et bellua immanis, quales fretum, quondam, quo ab Sicilia dividimur, ad perniciem, nigrantium circumfedis, fabulæ ferunt.

Livy, l. xxix. § 17.

The sentiments of the *Mourning Bride* are for the most part no less delicate than just copies of nature : in the following exception the picture is beautiful, but too artful to be suggested by severe grief.

Almeria. O no ! Time gives increase to my afflictions.

The circling hours, that gather all the woes
Which are diffus'd through the revolving year,
Come heavy laden with th' oppressive weight
To me ; with me, successively, they leave
The sighs, the tears, the groans, the restless cares,
And all the damps of grief, that did retard their flights,
They shake their downy wings, and scatter all
The dire collected dews on my poor head ;
Then fly with joy and swiftness from me. *Act 1. sc. 1.*

In the same play, Almeria seeing a dead body, which she took to be Alphonso's, expresses sentiments strained and artificial, which nature suggests not to any person upon such an occasion :

Had they our hearts or eyes, that did this deed ?
Could eyes endure to guide such cruel hands ?
Are not my eyes guilty alike with theirs,
That thus can gaze, and yet not turn to stone ?
— I do not weep ! The springs of tears are dry'd,
And of a sudden I am calm, as if [der'd !
All things were well ; and yet my husband's mur-
Yes,

Sentiments.

Yes, yes, I know to mourn: I'll sluice this heart,
The source of woe, and let the torrent in.

Act 5. sc. 11.

Lady Trueman. How could you be so cruel to defer giving me that joy which you knew I must receive from your preference? You have robb'd my life of some hours of happiness that ought to have been in it.

Drummer, act 5.

Pope's elegy to the memory of an unfortunate lady, expresses delicately the most tender concern and sorrow that one can feel for the deplorable fate of a person of worth. Such a poem, deeply serious and pathetic, rejects with disdain all fiction. Upon that account, the following passage deserves no quarter; for it is not the language of the heart, but of the imagination indulging its flights at ease, and by that means is eminently discordant with the subject. It would be a still more severe censure, if it should be ascribed to imitation, copying indifferently what has been said by others:

What tho' no weeping loves thy ashes grace,
Nor polish'd marble emulate thy face?
What though no sacred earth allow thee room,
Nor hallow'd dirge be mutter'd o'er thy tomb?
Yet shall thy grave with rising flow'rs be dress'd,
And the green turf lie lightly on thy breast:
There shall the morn her earliest tears bestow,
There the first roses of the year shall blow;
While angels with their silver wings o'er shade
The ground, now sacred by thy relics made.

5. Fanciful or finical sentiments. Sentiments that degenerate into point or conceit, however they may amuse in an idle hour, can never be the offspring of any serious or important passion. In the *Jerusalem* of Tasso, Tancredi, after a single combat, spent with fatigue and loss of blood, falls into a swoon; in which situation, understood to be dead, he is discovered by Erminia, who was in love with him to distraction. A more happy situation cannot be imagined, to raise grief in an instant to its highest pitch; and yet, in venting her sorrow, she descends most abominably into antithesis and conceit, even of the lowest kind:

E in lui versò d'inefficabil vena
Lacrime, e voce di sospirï mista.
In che misero punto hor qui me trista
Fortuna? a che veduta amara e mena?
Dopo gran tempo i' ti ritrovo a pena
Tancredi, e ti rivveggo, e non fon villa
Villa non fon da te, benchè presente
T trovando ti perdo eternamente.

Canto 19. st. 105.

Armida's lamentation respecting her lover Rinaldo is in the same vicious taste. *Vid.* canto 20. Stan. 124, 125, 126.

Queen. Give me no help in lamentation,
I am not barren to bring forth complaints:
All springs reduce their currents to mine eyes,
That I, being govern'd by the wat'ry moon,
May send forth plenteous tears to drown the world,
Ah, for my husband, for my dear lord Edward.

King Richard III. act 2. sc. 2.

Jane Shore. Let me be branded for the public scorn,

Sentiments.

Turn'd forth, and driven to wander like a vagabond,
Be friendless and forsaken, seek my bread
Upon the barren wild and desolate waite,
Feed on my sighs, and drink my falling tears;
Ere I content to teach my lips injustice,
Or wrong the orphan who has none to save him.

Jane Shore, act 4

Give me your drops, ye soft-descending rains;
Give me your streams, ye never ceasing springs;
That my sad eyes may still supply my duty,
And feed an everlasting flood of sorrow.

Ibid. act 5.

Jane Shore utters her last breath in a witty conceit:
Then all is well, and I shall sleep in peace——
'Tis very dark, and I have lost you now——
Was there not something I would have bequeath'd you?
But I have nothing left me to bestow,
Nothing but one sad sigh. Oh mercy, Heav'n! [*Dies.*]

Act 5.

Gilford to Lady Jane Gray, when both were condemned to die:

Thou stand'st, unmov'd;
Calm temper sits upon thy beauteous brow;
Thy eyes that flow'd so fast for Edward's loss,
Gaze unconcern'd upon the ruin round thee,
As if thou hadst resolv'd to brave thy fate,
And triumph in the midst of desolation.
Ha! see, it swells, the liquid crystal rises,
It starts in spite of thee——but I will catch it,
Nor let the earth be wet with dew so rich.

Lady Jane Gray, act 4. near the end.

The concluding sentiment is altogether finical, unsuitable to the importance of the occasion, and even to the dignity of the passion of love.

Cornille, in his *Examen de la Cid*, answering an objection, that his sentiments are sometimes too much refined for persons in deep distress, observes, that if poets did not indulge sentiments more ingenious or refined than are prompted by passion, their performances would often be low, and extreme grief would never suggest but exclamations merely. This is plain language to assert, that forc'd thoughts are more agreeable than those that are natural, and ought to be preferred.

The second class is of sentiments that may belong to an ordinary passion, but are not perfectly concordant with it, as tainted by a singular character.

In the last act of that excellent comedy, *The Careless Husband*, Lady Easy, upon Sir Charles's reformation, is made to express more violent and turbulent sentiments of joy than are consistent with the mildness of her character:

Lady Easy. O the soft treasure! O the dear reward of long-desiring love.—Thus! thus to have you mine, is something more than happiness; 'tis double life, and madness of abounding joy.

If the sentiments of a passion ought to be suited to a peculiar character, it is still more necessary that action be suited to the character. In the 5th act of the *Drummer*, Addison makes his gardener act even below the character of an ignorant credulous rustic: he gives him the behaviour of a gaping idiot.

The following instances are descriptions rather than sentiments, which compose a third class.

Of

Of this descriptive manner of painting the passions, there is in the *Hippolytus* of Euripides, *act* 5. an illustrious instance, viz. the speech of Theseus, upon hearing of his son's dismal exit. In Racine's tragedy of *Esther*, the queen hearing of the decree issued against her people, instead of expressing sentiments suitable to the occasion, turns her attention upon herself, and describes with accuracy her own situation:

Juste ciel ! tout mon sang dans mes veines se glace.

Act 1. *sc.* 3.

Again,

Aman. C'en est fait. Mon orgueil est forcé de plier.
L'inevitable *Aman* est réduit à prier.

Esther, *act* 3. *sc.* 5.

Athalie. Quel prodige nouveau me trouble et m'embarrasse ?

La douceur de sa voix, son enfance, sa grace,
Font insensiblement à mon inimitié
Succéder——Je serois sensible à la pitié ?

Athalie, *act* 2. *sc.* 7.

Titus. O de ma passion fureur desespérée !

Brutus of *Voltaire*, *act* 3. *sc.* 6.

What other are the foregoing instances but describing the passion another feels ?

Captain Flash, in a farce composed by Garrick, endeavours to hide his fear by saying, "What a damn'd passion I am in."

An example is given above of remorse and despair expressed by genuine and natural sentiments. In the fourth book of *Paradise Lost*, Satan is made to express his remorse and despair in sentiments which, tho' beautiful, are not altogether natural: they are rather the sentiments of a spectator than of a person who actually is tormented with these passions.

The fourth class is of sentiments expressed too early or too late.

Some examples mentioned above belong to this class. Add the following from *Venice Preserved*, *act* 5. at the close of the scene between Belvidera and her father Priuli. The account given by Belvidera of the danger she was in, and of her husband's threatening to murder her, ought naturally to have alarmed her relenting father, and to have made him express the most perturbed sentiments. Instead of which, he dissolves into tenderness and love for his daughter, as if he had already delivered her from danger, and as if there were a perfect tranquillity:

Canst thou forgive me all my follies past !
I'll henceforth be indeed a father; never,
Never more thus expose, but cherish thee,
Dear as the vital warmth that feeds my life,
Dear as those eyes that weep in fondness o'er thee:
Peace to thy heart.

Immoral sentiments exposed in their native colours, instead of being concealed or disguised, compose the fifth class.

The Lady Macbeth, projecting the death of the king, has the following soliloquy.

————— The raven himself's not hoarse
That croaks the fatal entrance of Duncan
Under my battlements. Come, all you spirits
That tend on mortal thoughts, unsex me here,
And fill me from the crown to the toe, top-full

Of direct cruelty ; make thick my blood,
Stop up th' access and passage to remorse,
That no compunctious visitings of nature
Shake my fell purpose.

Macbeth, *act* 1. *sc.* 7.

This speech is not natural. A treacherous murder was never perpetrated even by the most hardened mercenary without compunction: and that the lady here must have been in horrible agitation, appears from her invoking the infernal spirits to fill her with cruelty, and to stop up all avenues to remorse. But in that state of mind, it is a never-failing artifice of self-deceit to draw the thickest veil over the wicked action, and to extenuate it by all the circumstances that imagination can suggest: and if the crime cannot bear disguise, the next attempt is to thrust it out of mind altogether, and to rush on to action without thought. This last was the husband's method.

Strange things I have in head, that will to hand ;
Which must be acted ere they must be scann'd.

Act 3. *sc.* 5.

The lady follows neither of these courses, but in a deliberate manner endeavours to fortify her heart in the commission of an execrable crime, without even attempting to colour it. This, we think, is not natural; we hope there is no such wretch to be found as is here represented.

In the *Pompey* of Corneille, Photine counsels a wicked action in the plainest terms without disguise; *act* 1. *sc.* 1.

In the tragedy of *Esther*, (*act* 2. *sc.* 1.) Homan acknowledges without disguise his cruelty, insolence, and pride. And there is another example of the same kind in the *Agamemnon* of Seneca (beginning of *act* 2.) In the tragedy of *Athalie*, Mathan, in cool blood, relates to his friend many black crimes he had been guilty of, to satisfy his ambition. (*Act* 2. close of *sc.* 3.)

In Congreve's *Double-dealer*, Malkwell, instead of disguising or colouring his crimes, values himself upon them in a soliloquy:

Cynthia, let thy beauty gild my crimes; and what soever I commit of treachery or deceit, shall be imputed to me as a merit. — Treachery ! what treachery ? Love cancels all the bonds of friendship, and sets men right upon their first foundations.

Act 2. *sc.* 8.

In French plays, love, instead of being hid or disguised, is treated as a serious concern, and of greater importance than fortune, family, or dignity. The reason may be, that, in the capital of France, love, by the caresses of intercourse, has dwindled down from a real passion, to be a connection that is regulated entirely by the mode or fashion. This may in some measure excuse their writers, but will never make their plays be relished among foreigners.

The last class comprehends sentiments that are unnatural, as being suited to no character nor passion. These may be subdivided into three branches: first, sentiments unsuitable to the constitution of man, and to the laws of his nature; second, inconsistent sentiments; third, sentiments that are pure rant and extravagance.

When the fable is of human affairs, every event, every incident, and every circumstance, ought to be natural, otherwise the imitation is imperfect. But an imperfect imitation is a venial fault, compared with that

Sentiments.

Sentiments.

that of running crofs to nature. In the *Hippolytus* of Euripides, (*act* iv. *sc.* 5.) Hippolytus, wishing for another self in his own situation, "How much (says he) 'should I be touch'd with his misfortune!' as if it were natural to grieve more for the misfortunes of another than for one's own.

Ofsyn. Yet I behold her—yet—and now no more. Turn your lights inward, Eyes, and view my thought; So shall you still behold her—'Twill not be. O impotence of sight! mechanic sense, Which to exterior objects ow'nt thy faculty, Not seeing of election, but necessity. 'Thus do our eyes, as do all common mirrors, Successively reflect succeeding images. Nor what they would, but must; a star or toad; Just as the hand of chance administrators!

Mourning Bride, act 2. *sc.* 8. No man, in his senses, ever thought of applying his eyes to discover what passes in his mind; far less of blaming his eyes for not seeing a thought or idea. In Moliere's *P'Avare*, (*act* iv. *sc.* 7.) Harpagon being robbed of his money, seizes himself by the arm, mistaking it for that of the robber. And again he expresses himself as follows:

Je veux aller querir la justice, et faire donner la question à toute ma maison; à servantes, à valets, à fils, à fille, et à moi aussi.

This is so absurd as scarce to provoke a smile, if it be not at the author.

Of the second branch the following are examples.

Now bid me run,
And I will strive with things impossible,
Yea, get the better of them.

Julius Cæsar, act 2. *sc.* 3. Vos mains seules ont droit de vaincre un invincible.

Le Cid, act 5. *sc.* last. Que son nom soit beni. Que son nom soit chanté.

Esther, act 5. *sc.* last. Au de la de l'Éternité.

Me miserable! which way shall I fly
Infinite wrath and infinite despair?
Which way I fly is hell: myself am hell;
And in the lowest deep, a lower deep,
Still threatening to devour me, opens wide;
To which the hell I suffer seems a heav'n.

Paradise Lost, book 4. Of the third branch, take the following samples.

Lucan talking of Pompey's sepulchre,
Romanum nomen, et omne
Imperium magno est tumuli modus. Obrue saxa
Crimine plena desim. Si tota est Herculis Oete,
Et juga tota vacant Bromio Nyctea; quare
Unus in Egypto Magno lapis: Omnia Lagi
Rura tenere potest, si nullo cespitem nomen
Hæserit. Erremus populi, cinerumque tuorum,
Magne, metu nullas Nili calcemus arenas.

L. viii. l. 798.

Thus, in Rowe's translation:

Where there are seas, or air, or earth, or skies,
Where-e'er Rome's empire stretches, Pompey lies.
Far be the vile memorial then convey'd!
Nor let this stone the partial gods upbraid.

Shall Hercules all Oeta's heights demand,
And Nyssa's hill for Bacchus only stand;
While one poor pebble is the warrior's doom
That fought the cause of liberty and Rome?
If Fate decrees he must in Egypt lie,
Let the whole fertile realm his grave supply,
Yield the wide country to his awful shade,
Nor let us dare on any part to tread,
Fearful we violate the mighty dead.

The following passages are pure rant. *Coriolanus*, speaking to his mother,

What is this?
Your knees to me? to your corrected son?
Then let the pebbles on the hungry beach
Fillop the stars: then let the mutinous winds
Strike the proud cedars 'gainst the fiery fun:
Murdring impossibility, to make
What cannot be, slight work.

Coriolanus, act 5. *sc.* 3. *Cæsar.* Danger knows full well,
That Cæsar is more dangerous than he.
We were two lions litter'd in one day,
And I the elder and more terrible.

Julius Cæsar, act 2. *sc.* 4. *Almabide.* This day
I gave my faith to him, he his to me.

Almanzor. Good Heaven, thy book of fate before me lay

But to tear out the journal of this day.
Or if the order of the world below,
Will not the gap of one whole day allow,
Give me that minute when she made that vow.
That minute ev'n the happy from their bliss might give,
And those who live in grief a shorter time would live,
So small a link, if broke, th' eternal chain
Would like divided waters join again.

Conquest of Granada, act 3. *Almanzor.* I'll hold it fast
As life; and when life's gone, I'll hold this last.
And if thou tak'it it after I am slain,
I'll send my ghost to fetch it back again.

Conquest of Granada, part 2. *act* 3. *Lyndiraxa.* A crown is come, and will not fate allow,
And yet I feel something like death is near.

My guards, my guards—
Let not that ugly skeleton appear.
Sure Destiny mistakes; this death's not mine;
She doats, and meant to cut another line.
Tell her I am a queen—but 'tis too late;
Dying, I charge rebellion on my fate;
Bow down, ye slaves—
Bow quickly down, and your submission show;
I'm pleas'd to taste an empire ere I go.

Conquest of Granada, part 2. *act* 5. *Ventidius.* But you, ere love mis'd your wand'ring eyes,

Were sure the chief and best of human race,
Fram'd in the very pride and boast of nature,
So perfect, that the gods who form'd you wonder'd
At their own skill, and cry'd, A lucky hit
Has mend'd our design. *Dryden, All for Love, act* v.

Not to talk of the impiety of this sentiment, it is ludicrous instead of being lofty.

The

Sentinel,
Sepia.

The famous epitaph on Raphael is not less absurd than any of the foregoing passages:

Raphael, timuit, quo sospite, vincis,
Rerum magna parens, et moriente mori.

Imitated by Pope, in his epitaph on Sir Godfrey Kneller:

Living, great Nature fear'd he might outvie
Her works; and dying, fears herself may die.

Such is the force of imitation; for Pope of himself would never have been guilty of a thought so extravagant.

SENTINEL, or SENTRY, in military affairs, a private soldier placed in some post to watch the approach of the enemy, to prevent surprises, to stop such as would pass without orders or discovering who they are. They are placed before the arms of all guards, at the tents and doors of general officers, officers, colonels of regiments, &c.

SENTINEL *Perdu*, a soldier posted near an enemy, or in some very dangerous post where he is in hazard of being lost.

All sentinels are to be vigilant on their posts; neither are they to sing, smoke tobacco, nor suffer any noise to be made near them. They are to have a watchful eye over the things committed to their charge. They are not to suffer any light to remain, or any fire to be made, near their posts in the night-time; neither is any sentry to be relieved or removed from his post but by the corporal of the guard. They are not to suffer any one to touch or handle their arms, or in the night-time to come within ten yards of their post.

No person is to strike or abuse a sentry on his post; but when he has committed a crime, he is to be relieved, and then punished according to the rules and articles of war.

A sentinel, on his post in the night, is to know nobody but by the counter-sign: when he challenges, and is answered, *Relief*; he calls out, *Stand, relief! advance, corporal!* upon which the corporal halts his men, and advances alone within a yard of the sentry's firelock, (first ordering his party to rest, on which the sentry does the same), and gives him the counter-sign, taking care that no one hear it.

SEPIA, the CUTTLE-FISH, a genus belonging to the order of vermes mollusca. There are eight brachia interspersed on the interior side, with little round serrated cups, by the contraction of which the animal lays flat hold of any thing. Besides these eight arms, it has two tentacula longer than the arms, and frequently pedunculated. The mouth is situated in the centre of the arms, and is horny and hooked, like the bill of a hawk. The eyes are below the tentacula, towards the body of the animal. The body is fleshy, and received into a sheath as far as the breast. There are five species. See Plate CCLXII.

1. The loligo, or great cuttle, with short arms and long tentacula; the lower part of the body rhomboid and pinnated, the upper thick and cylindric. Inhabit all our seas: are gregarious; swift in their motions: take their prey by means of their arms; and embracing it, bring it to their central mouth. Adhere

to the rocks, when they wish to be quiescent, by means of the concave discs that are placed along their arms.

2. The octopodia, with eight arms, connected at their bottom by a membrane. This is the polyopus of Pliny, which he distinguishes from the loligo and sepia by the want of tentacula. Inhabits our seas. In hot climates these are found of an enormous size. The Indians affirm, that some have been seen two fathoms broad over their centre, and each arm nine fathoms long. When the Indians navigate their little boats, they go in dread of them; and lest these animals should sling their arms over and sink them, they never sail without an ax to cut them off.

3. The media, or middle cuttle, with a long, slender, cylindric body; tail finned, pointed, and carinated on each side; two long tentacula; the body almost transparent, green, but convertible into a dirty brown; confirming the remark of Pliny †, that they change their colour through fear, adapting it, chameleon-like, to that of the place they are in. The eyes are large and smaragdine.

4. The fepiola, or small cuttle, with a short body, rounded at the bottom; a round fin on each side; two tentacula. Taken off Flintshire.

5. The officialis, or official cuttle, with an ovated body; fins along the whole of the sides, and almost meeting at the bottom; two long tentacula; the body contains the bone, the cuttle-bone of the shops, which was formerly used as an absorbent. The bones are frequently flung on all our shores; the animal very rarely. This emits, (in common with the other species) when frightened or pursued, the black liquor which the ancients supposed darkened the circumambient wave, and concealed it from the enemy.

Th' endanger'd cuttle thus evades his fears,
And native hoards of fluid safety bears.
A pitchy ink peculiar glands supply,
Whose shades the sharpest beam of light defy.
Pursu'd, he bids the fable fountains flow,
And, wrapt in clouds, eludes th' impending foe.
The fish retreats unseen, while felt-born night,
With pious shade bescreens her parent's flight.

The ancients sometimes made use of it instead of ink. Perius mentions the species in his description of the noble Rudent.

*Jam liber, et bicolor positis membrana capillis,
Inque manus charta, nodisque venit arundo.
Tum queritur, crassus calamo quod pectus imbor;
Nigra quod insula venefica sepia lymphæ.*

At length, his book he spreads, his pen he takes;
His papers here in learned order lays,
And there his parchment's smoother side displays.
But oh! what croffes wait on studious men!
The cuttle's juice hangs clotted at our pen.
*In all my life such stuff I never knew,
So gummy this—Dilute it, it will do.
Nay, now 'tis water!* DRYDEN.

This animal was esteemed a delicacy by the ancients, and is eaten even at present by the Italians. Rondeletius gives us two receipts for the dressing, which may be continued to this day. Athenæus also leaves us the method of making an antique cuttle-fish sausage; and we learn from Aristotle, that those animals are in highest season when pregnant.

SEPIARIE, (from *seper*, "a hedge"), the name of the 44th order of Linnaeus's Fragments of a Natural Method, consisting of a beautiful collection of woody plants, some of which, from their size and elegance,

Sepia
Seps.Lib. ix.
29.

Septs
Septics.

are very proper furniture for hedges. See BOTANY, p. 315.

SEPS, in zoology. See LACERTA.

SEPTARIÆ, in natural history, a large class of fossils, commonly known by the names of *lulus Helmontii* and *waxen veins*.

They are defined to be fossils not inflammable, nor soluble in water; of a moderately firm texture and dusky hue, divided by several septa or thin partitions, and composed of a sparry matter greatly debased by earth; not giving fire with steel; fermenting with acids, and in great part dissolved by them; and calcining in a moderate fire.

Of this class there are two distinct orders of bodies, and under those six genera. The septariæ of the first order are those which are usually found in large masses, of a simple uniform construction, but divided by large septa either into larger and more irregular portions, or into smaller and more equal ones, called *talcs*. The genera of this order are four. 1. Those divided by septa or spar, called *seemie*: 2. Those divided by septa of earthy matter, called *gaophragmia*: 3. Those divided by septa of the matter of the pyrites, called *pyritica*: And, 4. Those divided by septa of spar, with an admixture of crystal, called *diaugophragmia*.

Those of the second order are such as are usually found in smaller masses, of a crusted structure, formed by various incrustations round a central nucleus, and divided by very thin septa. Of this order are only two genera. 1. Those with a short roundish nucleus, inclosed within the body of the mass; and, 2. Those with a long nucleus, standing out beyond the ends of the mass.

SEPTEMBER, the ninth month of the year, consisting of only thirty days: it took its name as being the seventh month, reckoning from March, with which the Romans began their year.

SEPTENNIAL, any thing lasting seven years.

SEPTENNIAL Elections. Blackstone, in his *Commentaries*, Vol. I. p. 189. says, (after observing that the utmost extent of time allowed the same parliament to sit by the stat. 6 W. and M. c. 2. was three years), "But, by the statute 1 Geo. I. Æ. 2. c. 38. (in order *professedly* to prevent the great and continued expenses of frequent elections, and the violent heats and animosities consequent thereupon, and for the peace and security of the government, just then recovering from the late rebellion), this term was prolonged to seven years; and what alone is an instance of the vast authority of parliament, the very same house that was chosen for three years enacted its own continuance for seven."

SEPTENTRIO, in astronomy, a constellation, more usually called *ursa minor*.

In cosmography, the term *septentrio* denotes the same with *north*: and hence septentrional is applied to any thing belonging to the north; as *septentrional signi*, *parallels*, &c.

SEPTICS, are those substances which promote putrefaction, chiefly the calcareous earths, magnesia, and tefaceous powders. Dr Pringle has reckoned common salt among the septic substances; but later observations give reason to believe, that it is only in consequence of its impurities that salt acts in this manner,

VOL. X.

it being highly probable that all pure salts are antiseptic. Septizon

SEPTIZON, or SEPTIZONIUM, in Roman antiquity, a celebrated mausoleum, built by Septimius Severus, in the tenth region of the city of Rome: it was so called from *septem* and *zona*, by reason it consisted of seven stories, each of which was surrounded by a row of columns.

SEPTUAGESIMA, in the kalendar, denotes the third Sunday before Lent, or before Quadragesima Sunday: supposed by some to take its name from its being about seventy days before Easter.

SEPTUAGINT, the name given to a Greek version of the books of the Old Testament, from its being supposed to be performed by seventy-two Jews, who are usually called the *seventy interpreters*; because seventy is a round number.

The history of this version is expressly written by Aristæas, an officer of the guards to Ptolemy Philadelphus, the substance of whose account is as follows: Ptolemy having erected a fine library at Alexandria, which he took care to fill with the most curious and valuable books from all parts of the world, was informed that the Jews had one containing the laws of Moses, and the history of that people; and being desirous of enriching his library with a Greek translation of it, applied to the high-priest of the Jews; and to engage him to comply with his request, set at liberty all the Jews whom his father Ptolemy Soter had reduced to slavery. After such a step, he easily obtained what he desired; Eleazar the Jewish high-priest sent back his ambassadors with an exact copy of the mosaical law, written in letters of gold, and six elders of each tribe, in all seventy-two; who were received with marks of respect by the king, and then conducted into the isle of Pharos, where they were lodged in a house prepared for their reception, and supplied with every thing necessary in abundance. They set about the translation without loss of time, and finished it in seventy-two days: and the whole being read in the presence of the king, he admired the profound wisdom of the laws of Moses; and sent back the deputies laden with presents, for themselves, the high-priest, and the temple.

This version was in use to the time of our blessed Saviour, and is that out of which all the citations in the New Testament, from the Old, are taken. It was also the ordinary and canonical translation made use of by the Christian church in the earliest ages; and it still subsists in the churches both of the east and west. It is however observable, that the chronology of the septuagint is different from the Hebrew text.

SEPTUM, in anatomy, an inclosure, or partition; a term applied to several parts of the body, which serve to separate one part from another; as, *septum narium*, or partition between the nostrils, &c.

SEPULCHRAL, something belonging to sepulchres or tombs: thus a sepulchral column is a column erected over a tomb, with an inscription on its shaft; and sepulchral lamps, those said to have been found burning in the tombs of several martyrs and others. See LAMP.

SEPULCHRE, a tomb or place destined for the interment of the dead. This term is chiefly used in speaking of the burying-places of the ancients, those

Septizon
Sepulchre.

Sepulchre
||
Sequestration.
—

of the moderns being usually called *tombs*.

Sepulchres were held sacred and inviolable; and the care taken of them has always been held a religious duty, grounded on the fear of God, and the belief of the soul's immortality. Those who have searched or violated them, have been thought odious by all nations, and were always severely punished.

The Egyptians called sepulchres *eternal houses*, in contradistinction to their ordinary houses or palaces, which they called *inns*, on account of their short stay in the one, in comparison of their long abode in the other.

Regular Canons of St SEPULCHRE, a religious order, formerly instituted at Jerusalem, in honour of the holy sepulchre, or the tomb of Jesus Christ.

Many of these canons were brought from the Holy Land into Europe, particularly into France, by Lewis the younger; into Poland, by Jaxa a Polish gentleman; and into Flanders, by the counts thereof; many also came into England. This order was, however, suppressed by pope Innocent VIII. who gave its revenues and effects to that of our Lady of Bethlehem: which also becoming extinct, they were bestowed on the knights of St John of Jerusalem. But the suppression did not take effect in Poland, where they still subsist, as also in several provinces of Germany. These canons follow the rule of St Augustine.

Knights of the Holy SEPULCHRE, a military order, established in Palestine about the year 1114.

The knights of this order in Flanders chose Philip II. king of Spain, for their master, in 1558, and afterwards his son; but the grand-master of the order of Malta prevailed on the last to resign: and when afterwards the duke of Nevers assumed the same quality in France, the same grand-master, by his interest and credit, procured a like renunciation of him, and a confirmation of the union of this order to that of Malta.

SEQUANI, a people anciently forming a part of Gallia Celtica, but annexed to Belgica by Augustus, separated from the Helvetii by mount Jura, with the Rhine on the east (Strabo), bordering on the Ædui, and Segutiano to the south, and Lingones to the west, (Tacitus). Now the Franche Comte.

SEQUESTRATION, in common law, is setting aside the thing in controversy from the possession of both the parties that contend for it. In which sense it is either voluntary, as when done by the consent of the parties; or necessary, as where it is done by the judge, of his own authority, whether the parties will or not.

A sequestration is also a kind of extent on an execution for debt, in the case of a beneficed clergyman, of the profits of his living, directed to the churchwardens to receive the same to satisfy the judgment.

Sequestration is granted on a person's standing out, and all the processes of contempt for non-appearance in the court of chancery, or exchequer, upon a bill exhibited; and also where obedience is not yielded to a decree, in which case the court grants a sequestration of the party's lands.

A sequestration is also made, in London, upon an action of debt; the course of proceeding in which case is this: The action being entered, the officer goes to

the defendant's shop or warehouse, when no person is there, and takes a padlock, and hangs it on the door, uttering these words: "I do sequester this warehouse, and the goods and merchandise therein, of the defendant in this action, to the use of the plaintiff," &c. after which he sets on his seal, and makes a return of the sequestration in the comptroller; and four days being passed after the return made, the plaintiff may, at the next court, have judgment to open the shop or warehouse, and to have the goods appraised by two freemen, who are to be sworn at the next court held for that comptroller; and then the serjeant puts his hand to the bill of appraisement, and the court grants judgment thereon: but yet the defendant may put in bail before satisfaction, and by that means dissolve the sequestration; and after satisfaction, may put in bail to disprove the debt, &c.

In the time of the civil wars, sequestration was used for a seizing of the estates of delinquents for the use of the commonwealth.

SEQUESTRATION, in Scots law. See LAW, N° clxxii. 10. and clxxiii. 12.

SEQUIN, a gold coin, struck at Venice, and in several parts of the grand signior's dominions. See the article COIN.

SERAGLIO, a Persian word, which signifies the "palace of a prince or lord;" in which sense the houses of the ambassadors of Britain, France, &c. are, at Constantinople, called their *seraglios*. But the term *seraglio* is used, by way of eminence, for the palace of the grand signior at Constantinople, where he keeps his court, in which his concubines are lodged, and where the youth are trained up for the principal posts of the empire. It is in form of a triangle, about two miles round, at the end of the promontory Chryfoceras, now called the *seraglio-point*: the buildings extend to the top of the hill, and from thence there are gardens that reach to the sea. The outward appearance is not very beautiful, the architecture being irregular, consisting of separate edifices in the manner of pavilions and domes. The old seraglio is the palace where the grand signior's old mistresses are kept.

The ladies of the haram, which is the part allotted to the women, are a collection of young beautiful girls, who, on their admission, are committed to the charge of some old lady, and taught music, dancing, and other accomplishments. These frequently play and dance before the grand signior, while others entertain him with their conversation. Besides these ladies, there are a great many black eunuchs and female slaves in the seraglio, whose business it is to guard and wait upon them.

SERAPH, or SERAPHIM; a spirit of the highest rank in the hierarchy of angels; who are thus called from their being supposed to be most inflamed with divine love, by their nearer and more immediate attendance at the throne of God, and to communicate their fervour to the remoter and inferior orders. See ANGEL.

SERAPHIC, burning or inflamed with love or zeal, like a seraphim: thus St Bonaventure is called the *seraphic doctor*, from his abundant zeal and fervour.

SERAPION, a physician of Alexandria. He and

Sergeanty
||
Serpens.

Philinus of the Isle of Cos were both scholars of Herophilus, and were founders of the Empiric sect; which happened about 287 B. C.

SERENADE, a kind of concert given in the night by a lover to his mistress, under her window. These sometimes only consist of instrumental music, but at other times voices are added: the music and songs composed for these occasions are also called *serenades*.

SERENE, a title of honour given to several princes, and to the principal magistrates of republics. The king of England, the republic and doge of Venice, and the children of the king of Spain, are called *myff serene*; and when the pope or the sacred college write to the emperor, to kings, or to the doge, they give them no other title. In like manner, the emperor gives no other title to any king, except to the king of France.

SERENUS (Sammonicus), a celebrated physician in the reigns of the emperors Severus and Caracalla, in and about the year 200. He wrote several treatises on history and the works of nature; but there is only one of them extant, which is a very indifferent poem on the Remedies of Diseases. He was murdered at a festival by the order of Caracalla. He had a library that contained 62,000 volumes, which Quintus Serenus Sammonicus his son gave to Gordian the Younger, to whom he was preceptor.

SERES, (Ptolemy); a people of the Farther Asia; bounded on the west by Scythia extra Imaum; on the north and east, by Terra Incognita; and on the south, by India extra Gangem. According to these limits, their country answers nearly to Cathoy or North China. Other authors vary greatly in placing them, though the generality agree in placing them far to the east. Mela places them between the Indi and Scythæ; and perhaps beyond the Indi, if we distinguish the Sinæ from them. The ancients commend them for their cotton manufactures, different from the produce of the bombyces or silk-worms, called *seres* by the Greeks; whence *serica*, "silk."

SERGE, a woollen stuff, manufactured in a loom; of which there are various kinds, denominated either from their different qualities, or from the places where they are wrought. The most considerable is the London serge, which is highly valued abroad; and of which a manufacture has for some years been carried on in France.

SERGEANT, or SERJEANT *at Law*, or of the *Coif*, is the highest degree taken at the common law, as that of Doctor is of the civil law; and as these are supposed to be the most learned and experienced in the practice of the courts, there is one court appointed for them to plead in by themselves, which is the common pleas, where the common law of England is most strictly observed: but they are not restricted from pleading in any other court, where the judges, who cannot have that honour till they have taken the degree of serjeant at law, call them *brothers*.

SERGEANT *at Arms*, or *Mace*, an officer appointed to attend the person of the king; to arrest traitors, and such persons of quality as offend; and to attend the lord high steward, when sitting in judgment on a traitor.—The number of these officers is by statute limited to 30.

SERGEANT, in war, is an inferior officer in a

company of foot or troop of dragoons, armed with an halbert, and appointed to see discipline observed, to teach the soldiers the exercise of their arms, to order, frainen, and form their ranks, files, &c. He receives the orders from the adjutant, which he communicates to his officers. Each company generally has two sergeants.

SERGEANTY (*Sorjeantia*), signifies, in law, a service that cannot be due by a tenant to any lord but the king; and this is either *grand serjeanty*, or *petit*. The first is a tenure by which the one holds his lands of the king by such services as he ought to do in person to the king at his coronation; and may also concern matters military, or services of honour in peace; as to be the king's butler, carver, &c. *Petit serjeanty* is where a man holds lands of the king to furnish him yearly with some small thing towards his wars; and is in effect payable as rent. Though all tenures are turned into *feage* by the 12 Car. II. cap. 24; yet the honorary services of grand serjeanty still remain, being therein excepted. See *KNIGHT-SERVICE*.

SERIES, in general, denotes a continued succession of things in the same order, and having the same relation or connection with each other: in this sense we say, a series of emperors, kings, bishops, &c.

In natural history, a series is used for an order or subdivision of some class of natural bodies; comprehending all such as are distinguished from the other bodies of that class, by certain characters which they possess in common, and which the rest of the bodies of that class have not.

SERIES, in mathematics, is a number of terms, whether of numbers or quantities, increasing or decreasing in a given proportion.

SERIPHUS (anc. geog.) one of the Cyclades or islands in the Egean sea, called *Saxum Seriphium* by Tacitus, as if all a rock; one of the usual places of banishment among the Romans. The people, *Seriphii*; who, together with the Siphni, joined Greece against Xerxes, and were almost the only islanders who refused to give him earth and water in token of submission, (Herodotus). *Seriphia Rena*, a proverbial saying concerning a person who can neither sing nor say; frogs in this island being said to be dumb, (Pliny).

SEROSITY, in medicine, denotes an over-abundance of serum.

SERPENS, in astronomy, a constellation of the northern hemisphere, consisting of 17 stars, according to Ptolemy; of 19, according to Tycho; and of 59 in the Britannic catalogue.

SERPENS *Biceps*, or *Double-headed Snake*; a monster of the serpent kind, there being no permanent species of this conformation. That represented on Plate CCLXII. and copied from Edwards, came from the island of Barbadoes; and was said to have been taken out of an egg of the size of a small pullet's egg, by a man who found it under-ground as he was digging. The heads were not in a horizontal position when the snake lay on its belly, but inclined to each other on their under-sides, leaving an opening for the throat to come in between the two heads underneath, as is expressed at A. The upper-side, for the whole length, was covered with small scales, falling one over another; the belly was covered with single scales running across it, in the form of half rings. It was all over of a yellowish

Serpent. lowish colour, without any spots or variation. Mr Edwards also informs us that a person brought to him a common English snake, which had two heads quite separate from each other, the necks parting about an inch from the head.

SERPENT, SERPENS, in zoology, a general term for all amphibious animals without legs. See COLUBER, BOA, ANGUIS, CÆCILIA, AMPHISBÆNA, CROTALUS, &c.

The serpent has from the beginning been the enemy of man; and it has hitherto continued to terrify and annoy him, notwithstanding all the arts which have been practised to destroy it. Formidable in itself, it deters the invader from the pursuit; and from its figure, capable of finding shelter in a little space, it is not easily discovered by those who would venture to try the encounter. Thus possessed at once of potent arms and inaccessible or secure retreats, it baffles all the arts of man, though ever so earnestly bent upon its destruction. For this reason, there is scarce a country in the world that does not still give birth to this poisonous brood, that seem formed to quell human pride, and repress the boasts of security. Mankind have driven the lion, the tiger, and the wolf, from their vicinity; but the snake and the viper still defy their power.

Their numbers, however, are thinned by human assiduity; and it is possible some of the kinds are wholly destroyed. In none of the countries of Europe are they sufficiently numerous to be truly terrible. The various malignity that has been ascribed to European serpents of old, is now utterly unknown; there are not above three or four kinds that are dangerous, and their poison operates in all in the same manner†. The drowly death, the starting of the blood from every pore, the insatiable and burning thirst, the melting down the solid mass of the whole form into one heap of putrefaction, said to be occasioned by the bites of African serpents, are horrors with which we are entirely unacquainted.

But though we have thus reduced these dangers, having been incapable of wholly removing them, in other parts of the world they still rage with all their ancient malignity. In the warm countries that lie within the tropic, as well as in the cold regions of the north, where the inhabitants are few, the serpents propagate in equal proportion. But of all countries, those regions have them in the greatest abundance where the fields are unpeopled and fertile, and where the climate supplies warmth and humidity. All along the swampy banks of the river Niger or Oroonoko, where the sun is hot, the forests thick, and the men but few, the serpents cling among the branches of the trees in infinite numbers, and carry on an unceasing war against all other animals in their vicinity. Travellers have assured us, that they have often seen large snakes twining round the trunk of a tall tree, encompassing it like a wreath, and thus rising and descending at pleasure. We are not, therefore, to reject as wholly fabulous the accounts left us by the ancients of the terrible devastations committed by a single serpent. It is probable, in early times, when the arts were little known, and mankind were but thinly scattered over the earth, that serpents, continuing undisputed possessors of the forest, grew to an amazing magnitude; and every other tribe of animals fell before them. It then might have hap-

pened, that serpents reigned the tyrants of a district for centuries together. To animals of this kind, grown by time and rapacity to 100 or 150 feet in length, the lion, the tiger, and even the elephant itself, were but feeble opponents. That horrible fætor, which even the commonest and the most harmless snakes are still found to diffuse, might, in these larger ones, become too powerful for any living being to withstand; and while they preyed without distinction, they might thus also have poisoned the atmosphere around them. In this manner, having for ages lived in the hidden and unpeopled forest, and finding, as their appetites were more powerful, the quantity of their prey decreasing, it is possible they might venture boldly from their retreats into the more cultivated parts of the country, and carry conflagration among mankind, as they had before desolation among the lower ranks of nature. We have many histories of antiquity, presenting us such a picture; and exhibiting a whole nation sinking under the ravages of a single serpent. At that time man had not learned the art of uniting the efforts of many to effect one great purpose. Opposing multitudes only added new victims to the general calamity, and increased mutual embarrassment and terror. The animal was therefore to be singly opposed by him who had the greatest strength, the best armour, and the most undaunted courage. In such an encounter, hundreds must have fallen; till one, more lucky than the rest, by a fortunate blow, or by taking the monster in its torpid interval, and surcharged with spoil, might kill, and thus rid his country of the destroyer. Such was the original occupation of heroes; and those who first obtained that name, from their destroying the ravagers of the earth, gained it much more deservedly than their successors, who acquired their reputation only for their skill in destroying each other. But as we descend into more enlightened antiquity, we find these animals less formidable, as being attacked in a more successful manner. We are told, that while Regulus led his army along the banks of the river Bagrada in Africa, an enormous serpent disputed his passage over. We are assured by Pliny, who says that he himself saw the skin, that it was 120 feet long, and that it had destroyed many of the army. At last, however, the battering engines were brought out against it; and these assailing it at a distance, it was soon destroyed. Its spoils were carried to Rome, and the general was decreed an ovation for his success. There are, perhaps, few facts better ascertained in history than this: an ovation was a remarkable honour; and was given only for some signal exploit that did not deserve a triumph: no historian would offer to invent that part of the story at least, without being subject to the most shameful detection. The skin was kept for several years after in the Capitol; and Pliny says he saw it there. At present, indeed, such ravages from serpents are scarce seen in any part of the world; not but that, in Africa and America, some of them are powerful enough to brave the assaults of men to this day.

*Neguent expleri corda tuendo
Terruites oculos villosaque fessis pectore.*

If we take a survey of serpents in general, they have marks by which they are distinguished from all the rest of animated nature. They have the length and the suppleness of the eel, but want fins to swim with; they have

† See Poisson.

have the scaly covering and pointed tail of the lizard, but they want legs to walk with; they have the crawling motion of the worm, but, unlike that animal, they have lungs to breathe with: like all the reptile kind, they are resentful when offended; and nature has supplied them with terrible arms to revenge every injury.

Though they are possessed of very different degrees of malignity, yet they are all formidable to man, and have a strong similitude of form to each other. With respect to their conformation, all serpents have a very wide mouth in proportion to the size of the head; and what is very extraordinary, they can gape and swallow the head of another animal which is three times as big as their own. However, it is no way surprising that the skin of the snake should stretch to receive so large a morsel; the wonder seems how the jaws could take it in. To explain this, it must be observed, that the jaws of this animal do not open as ours, in the manner of a pair of hinges, where bones are applied to bones and play upon one another: on the contrary, the serpent's jaws are held together at the roots by a stretching muscular skin; by which means they open as widely as the animal chooses to stretch them, and admit of a prey much thicker than the snake's own body. The throat, like stretching leather, dilates to admit the morsel; the stomach receives it in part, and the rest remains in the gullet, till putrefaction and the juices of the serpent's body unite to dissolve it.

Some serpents have fangs or canine teeth, and others are without them. The teeth in all are crooked and hollow; and, by a peculiar contrivance, are capable of being erected or depressed at pleasure.

The eyes of all serpents are small, if compared to the length of the body; and though differently coloured in different kinds, yet the appearance of all is malign and heavy; and, from their known qualities, they strike the imagination with the idea of a creature meditating mischief. In some, the upper eye-lid is wanting, and the serpent winks only with that below; in others, the animal has a nictitating membrane or skin, resembling that which is found in birds, which keeps the eye clean and preserves the sight. The substance of the eye in all is hard and horny; the crystalline humour occupying a great part of the globe.

The holes for hearing are very visible in all: but there are no conduits for smelling; though it is probable that some of them enjoy that sense in tolerable perfection.

The tongue in all these animals is long and forky. It is composed of two long fleshy substances, which terminate in sharp points, and are very pliable. At the root it is connected very strongly to the neck by two tendons, that give it a variety of play. Some of the viper kind have tongues a fifth part of the length of their bodies; they are continually darting them out; but they are entirely harmless, and only terrify those who are ignorant of the real situation of their poison.

If from the jaws we go on to the gullet, we shall find it very wide for the animal's size, and capable of being distended to a great degree; at the bottom of this lies the stomach, which is not so capacious, and receives only a part of the prey, while the rest continues in the gullet for digestion. When the substance in the stomach is dissolved into chyle, it passes into the

intestines, and from thence goes to nourishment, or to be excluded by the vent.

Like most other animals, serpents are furnished with lungs, which we suppose are serviceable in breathing, though we cannot perceive the manner in which this operation is performed; for though serpents are often seen apparently to draw in their breath, yet we cannot find the smallest signs of their ever respiring it again. Their lungs, however, are long and large, and doubtless are necessary to promote their languid circulation. The heart is formed as in the tortoise, the frog, and the lizard kinds, so as to work without the assistance of the lungs. It is single; the greatest part of the blood flowing from the great vein to the great artery by the shortest course. By this contrivance of nature we easily gather two consequences; that snakes are amphibious, being equally capable of living on land and in the water; and that also they are torpid in winter, like the bat, the lizard, and other animals formed in the same manner.

The vent in these animals serves for the emission of the urine and the feces, and for the purposes of generation. The instrument of generation in the male is double, being forked like the tongue: the ovaries in the female are double also; and the aperture is very large, in order to receive the double instrument of the male. They copulate in their retreats; and it is said by the ancients, that in this situation they appear like one serpent with two heads.

As the body of this animal is long, slender, and capable of bending in every direction, the number of joints in the back-bone are numerous beyond what one would imagine. In the generality of quadrupeds, they amount to not above 30 or 40; in the serpent kind they amount to 145 from the head to the vent, and 25 more from that to the tail. The number of these joints must give the back-bone a surprising degree of pliancy; but this is still increased by the manner in which each of these joints are locked into the other. In man and quadrupeds, the flat surfaces of the bones are laid one against the other, and bound tight by sinews; but in serpents, the bones play one within the other like ball and socket, so that they have full motion upon each other in every direction.

Though the number of joints in the back-bone is great, yet that of the ribs is still greater; for, from the head to the vent, there are two ribs to every joint, which makes their number 290 in all. These ribs are furnished with muscles, four in number; which being inserted into the head, run along to the end of the tail, and give the animal great strength and agility in all its motions.

The skin also contributes to its motions, being composed of a number of scales, united to each other by a transparent membrane, which grows harder as it grows older, until the animal changes, which is generally done twice a-year. This cover then bursts near the head, and the serpent creeps from it by an undulatory motion, in a new skin, much more vivid than the former. If the old slough be then viewed, every scale will be distinctly seen like a piece of net-work, and will be found greatest where the part of the body they covered was largest.

There is much geometrical neatness in the disposal

of the serpent's scales, for assisting the animal's sinuous motion. As the edges of the foremost scales lie over the ends of their following scales, so those edges, when the scales are erected, which the animal has a power of doing in a small degree, catch in the ground, like the nails in the wheel of a chariot, and so promote and facilitate the animal's progressive motion. The erecting these scales is by means of a multitude of distinct muscles with which each is supplied, and one end of which is tacked each to the middle of the foregoing.

In some of the serpent kind there is the exactest symmetry in these scales; in others they are disposed more irregularly. In some there are larger scales on the belly, and often answering to the number of ribs; in others, however, the animal is without them. Upon this slight difference, Linnæus has founded his distinctions of the various classes of the serpent tribe.

When we come to compare serpents with each other, the first great distinction appears in their size; no other tribe of animals differing so widely in this particular. This tribe of animals, like that of fishes, seems to have no bounds put to their growth: their bones are in a great measure cartilaginous, and they are consequently capable of great extension: the older, therefore, a serpent becomes, the larger it grows; and as they seem to live to a great age, they arrive at an enormous size.

Leguat assures us, that he saw one in Java that was 50 feet long. Carli mentions their growing to above 40 feet; and we have now the skin of one in the British Museum that measures 32. Mr Wentworth, who had large concerns in the Berberies in America, assures us, that in that country they grow to an enormous length. He one day sent out a soldier, with an Indian, to kill wild-fowl for the table; and they accordingly went some miles from the fort: in pursuing their game, the Indian, who generally marched before, beginning to tire, went to rest himself upon the fallen trunk of a tree, as he supposed it to be; but when he was just going to sit down, the enormous monster began to move; and the poor savage perceiving that he had approached a boa, the greatest of all the serpent kind, dropped down in an agony. The soldier, who perceived at some distance what had happened, levelled at the serpent's head, and by a lucky aim shot it dead: however, he continued his fire until he was assured that the animal was killed; and then going up to rescue his companion, who was fallen motionless by its side, he, to his astonishment, found him dead likewise, being killed by the fright. Upon his return to the fort, and telling what had happened, Mr Wentworth ordered the animal to be brought up, when it was measured, and found to be 36 feet long. He had the skin stuffed, and then sent to Europe as a present to the prince of Orange, in whose cabinet it is now to be seen at the Hague; but the skin is shrunk, by drying, two or three feet. In the East Indies they grow also to an enormous size, particularly in the island of Java, where, we are assured, that one of them will destroy and devour a buffalo. See Boa.

But it is happy for mankind that the rapacity of these frightful creatures is often their punishment; for whenever any of the serpent kind have gorged themselves in this manner, whenever their body is seen particularly

distended with food, they then become torpid, and may be approached and destroyed with safety. Patient of hunger to a surprising degree, whenever they seize and swallow their prey, they seem, like surfeited gluttons, unwieldy, stupid, helpless, and sleepy: they at that time seek some retreat, where they may lurk for several days together, and digest their meal in safety: the smallest effort at that time is capable of destroying them; they can scarce make any resistance; and they are equally unqualified for flight or opposition: that is the happy opportunity of attacking them with success; at that time the naked Indian himself does not fear to assail them. But it is otherwise when this sleepy interval of digestion is over; they then issue, with famished appetites, from their retreats, and with accumulated terrors, while every animal of the forest flies before them.

Carli describes the long serpent of Congo, making its track through the tall grass, like mowers in a summer's day. He could not without terror behold whole lines of grass lying levelled under the sweep of its tail. In this manner it moved forward with great rapidity, until it found a proper situation frequented by its prey: there it continued to lurk, in patient expectation; and would have remained for weeks together, had it not been disturbed by the natives.

Other creatures have a choice in their provision: but the serpent indiscriminately preys upon all; the buffalo, the tiger, and the gazelle. One would think that the porcupine's quills might be sufficient to protect it; but whatever has life, serves to appease the hunger of these devouring creatures: porcupines, with all their quills, have frequently been found in their stomachs when killed and opened; nay, they most frequently are seen to devour each other.

A life of savage hostility in the forest, offers the imagination one of the most tremendous pictures in nature. In those burning countries, where the sun dries up every brook for hundreds of miles round; when what had the appearance of a great river in the rainy season, becomes, in summer, one dreary bed of sand; in those countries, a lake that is never dry, or a brook that is perennial, is considered by every animal as the greatest convenience of nature. When they have discovered this, no dangers can deter them from attempting to slake their thirst. Thus the neighbourhood of a rivulet, in the heart of the tropical continents, is generally the place where all the hostile tribes of nature draw up for the engagement. On the banks of this little envied spot, thousands of animals of various kinds are seen venturing to quench their thirst, or preparing to seize their prey. The elephants are perceived in a long line, marching from the darker parts of the forest; the buffaloes are there, depending upon numbers for security; the gazells relying solely upon their swiftness; the lion and tiger waiting a proper opportunity to seize; but chiefly the larger serpents are upon guard there, and defend the accesses of the lake. Not an hour passes without some dreadful combat; but the serpent, defended by its scales, and naturally capable of sustaining a multitude of wounds, is, of all others, the most formidable. It is the most wakeful also; for the whole tribe sleep with their eyes open, and are consequently for ever upon the

the watch; so that, till their rapacity is satisfied, few other animals will venture to approach their station.

But though these animals are of all others the most voracious; and though the morsel which they swallow without chewing, is greater than what any other creature, either by land or water, can devour; yet no animals upon earth bear abstinence so long as they. A single meal, with many of the naked kind, seems to be the adventure of a season; it is an occurrence, of which they have been for weeks, nay sometimes for months, in patient expectation. When they have seized their prey, their industry for several weeks is entirely discontinued; the fortunate capture of an hour often satisfies them for the remaining period of their annual activity. As their blood is colder than that of most other terrestrial animals, and as it circulates but slowly through their bodies, so their powers of digestion are but feeble. Their prey continues, for a long time, partly in the stomach, partly in the gullet, and is often seen in part hanging out of the mouth. In this manner it digests by degrees; and in proportion as the part below is dissolved, the part above is taken in. It is not therefore till this tedious operation is entirely performed, that the serpent renews its appetite and its activity. But should any accident prevent it from issuing once more from its cell, it still can continue to bear famine, for weeks, months, nay for years together. Vipers† are often kept in boxes for six or eight months, without any food whatever; and there are little serpents sometimes sent over to Europe from Grand Cairo, that live for several years in glasses, and never eat at all, nor even stain the glass with their excrements.

If, leaving the consideration of their appetites, we come to compare serpents as to their voices, some are found silent, some have a peculiar cry; but hissing is the sound which they most commonly send forth, either as a call to their kind, or as a threat to their enemies. In the countries where they abound, they are generally silent in the middle of the day, when they are obliged to retire from the heat of the climate; but as the cool of the evening approaches, they are then heard issuing from their cells, with continued hissings; and such is the variety of their notes, that some have assured us they very much resemble the music of an English grove. This some will hardly credit: at any rate, such notes, however pleasing, can give but very little delight, when we call to mind the malignity of the miscreant. If considered, indeed, as they answer the animal's own occasions, they will be found well adapted to its nature, and fully answering the purposes of terrifying such as would venture to offend it.

With respect to motion, some serpents, particularly those of the viper kind, move slowly; while others dart with amazing swiftness. The motion in all is similar; but the strength of body in some gives a very different appearance. The viper, that is but a slow feeble-bodied animal, makes way in a heavy undulating manner; advancing its head, then drawing up its tail behind, and bending the body into a bow; then from the spot where the head and tail were united, advancing the head forward as before. This, which is the motion of all serpents, is very different from that of the earth-worm or the naked snail. The serpent, as

was said above, has a back-bone, with numerous joints; and this bone the animal has a power of bending in every direction, but without being able to shorten or lengthen it at pleasure. The earth-worm, on the other hand, has no back-bone; but its body is composed of rings, which, like a barber's puff, it can lengthen or shorten as it finds necessary. The earth-worm, therefore, in order to move forward, lengthens the body; then by the fore part clings to the ground where it has reached, and then contracts and brings up its rear: then, when the body is thus shortened, the fore-part is lengthened again for another progression, and so on. The serpent, instead of shortening the body, bends it into an arch; and this is the principal difference between serpentine and vermicular progression.

We have instanced this motion in the viper, as most easily discerned; but there are many serpents that dart with such amazing swiftness, that they appear rather to leap than crawl. It is most probable, however, that no serpent can dart upon even ground farther than its own length at one effort. Our fears indeed may increase the force of their speed, which is sometimes found so fatal. We are told by some, that they will dart to a very great distance; but this we have never been able to ascertain. The manner of progression in the swiftest serpent we know, which is the jacobus, is by instantly coiling itself upon its tail, and darting from thence to its full extent; then carrying the tail, as quick as lightning, to the head; coiling and darting again: and by this means proceeding with extreme rapidity, without ever quitting the ground. Indeed, if we consider the length and the weakness of the back-bone in all these animals; if we regard the make of the vertebrae, in which we shall find the junctures all formed to give play, and none to give power; we cannot be of opinion that they have a faculty of springing from the ground, as they entirely want a *fulcrum*, if we may so express it, from whence to take their spring; the whole body being composed of unsupported muscles and joints that are yielding.

Though all serpents are amphibious, some are much fonder of the water than others; and, though destitute of fins or gills, remain at the bottom, or swim along the surface with great ease. From their internal structure, we see how well adapted they are for either element; and how capable their blood is of circulating at the bottom, as freely as in the frog or the tortoise. They can, however, endure to live in fresh water only; for salt is an effectual bane to the whole tribe. The greatest serpents are most usually found in fresh water, either choosing it as their favourite element, or finding their prey in such places in the greatest abundance. But that all will live and swim in liquids, appears from an experiment of Redi; who put a serpent into a large glass vessel of wine, where it lived swimming about six hours; though, when it was by force immersed and put under that liquid, it lived only one hour and an half. He put another in common water, where it lived three days; but when it was kept under water, it lived only about 12 hours. Their motion there, however, is perfectly the reverse of what it is upon land; for, in order to support themselves upon an element lighter than their bodies, they are obliged to increase their surface in a very artificial

Serpent.

manner. On earth their windings are perpendicular to the surface; in water they are parallel to it: in other words, if a person should wave his hand up and down, it will give an idea of the animal's progress on land; if to the right and left, it will give some idea of its progress on the water.

Some serpents have a most horrible fætor attending them, which is alone capable of intimidating the brave. This proceeds from two glands near the vent, like those in the weasel or polecat; and, like those animals, in proportion as they are excited by rage or by fear, the scent grows stronger. It would seem, however, that such serpents are as most venomous are least offensive in this particular; since the rattlesnake and the viper have no smell whatever; nay, we are told, that at Calcutt and Cranganon, in the East Indies, there are some very noxious serpents, who are so far from being disagreeable, that their excrements are sought after, and kept as the most pleasing perfume. The Eculapian serpent is also of this number.

Some serpents bring forth their young alive, as the viper; some bring forth eggs, which are hatched by the heat of their situation, as the common black snake, and the majority of the serpent tribe. When a reader, ignorant of anatomy, is told, that some of those animals produce their young alive, and that some produce eggs only, he is apt to suppose a very great difference in the internal conformation, which makes such a variety in the manner of bringing forth. But this is not the case: these animals are internally alike, in whatever manner they produce their young; and the variety in their bringing forth is rather a slight than a real discrimination. The only difference is, that the viper hatches her eggs, and brings them to maturity, within her body; the snake is more premature in her productions, and sends her eggs into the light some time before the young ones are capable of leaving the shell. Thus, if either are opened, the eggs will be found in the womb, covered with their membranous shell, and adhering to each other like large beads on a string. In the eggs of both, the young ones will be found, though at different stages of maturity: those of the viper will crawl and bite in the moment the shell that incloses them is broke open; those of the snake are not yet arrived at their perfect form.

Father Labat took a serpent of the viper kind that was nine feet long, and ordered it to be opened in his presence. He then saw the manner in which the eggs of these animals lie in the womb. In this creature there were six eggs, each of the size of a goose egg, but longer, more pointed, and covered with a membranous skin, by which also they were united to each other. Each of these eggs contained from 13 to 15 young ones, about six inches long, and as thick as a goose-quill. Though the female from whence they were taken was spotted, the young seemed to have a variety of colours very different from the parent; and this led the traveller to suppose that the colour was no characteristic mark among serpents. These little mischievous animals were no sooner let loose from the shell, than they crept about, and put themselves into a threatening posture, coiling themselves up and biting the stick with which he was destroying them. In this manner he killed 74 young ones; those that were contained in one of the eggs escaped at the place where the female

was killed, by the bursting of the egg and their getting among the bushes. Serpent.

The last distinction that we shall mention, but the most material among serpents is, that some are venomous, and some, inoffensive. The various calamities that the poison of serpents is capable of producing, are not only inflicted by the animal itself, but by men more mischievous even than serpents, who prepare their venom to destroy each other. With this the savages poison their arms, and also prepare their revengeful potions. The ancients were known to preserve it for the purposes of suicide; and even among semi-barbarous countries at this day, the venom of snakes is used as a philtre.

But though the poison be justly terrible to us, it has been given to very good purposes for the animal's own proper support and defence. Without this, serpents, of all other animals, would be the most exposed and defenceless; without feet for escaping a pursuit, without teeth capable of inflicting a dangerous wound, or without strength for resistance; incapable, from their size, of finding security in very small retreats like the earth-worm, and disgusting all from their deformity, nothing was left for them but a speedy extirpation. But furnished as they are with powerful poison, every rank of animals approach them with dread, and never seize them but at an advantage. Nor is this all the benefit they derive from it. The malignity of a few serves for the protection of all. Tho' not above a tenth of their number are actually venomous, yet the similitude they all bear to each other, excites a general terror of the whole tribe; and the uncertainty of their enemies in which the poison chiefly resides, makes even the most harmless formidable. Thus Providence seems to have acted with double precaution: it has given some of them poison for the general defence of a tribe naturally feeble; but it has thinned the numbers of those which are venomous, lest they should become too powerful for the rest of animated nature.

From these noxious qualities in the serpent kind, it is no wonder that not only man, but beasts and birds, carry on an unceasing war against them. The ichneumon of the Indians, and the peccary † of America, destroy them in great numbers. These animals have the art of seizing them near the head; and it is said that they can skin them with great dexterity. The vulture and the eagle also prey upon them in great abundance; and often, fousing down from the clouds, drop upon a long serpent, which they snatch up frugging and writhing in the air. Dogs also are bred up to oppose them. Father Feuillée tells us, that being in the woods of Martinico, he was attacked by a large serpent, which he could not easily avoid, when his dog immediately came to his relief, and seized the assailant with great courage. The serpent entwined him, and pressed him so violently, that the blood came out of his mouth, and yet the dog never ceased till he had tore it to pieces. The dog was not sensible of his wounds during the fight; but soon after his head swelled prodigiously, and he lay on the ground as dead. But his master having found hard by a banana tree, he applied its juice, mixed with treacle, to the wounds; which recovered the dog, and quickly healed his fcores.

† See the articles SU and VERRA.

Serpent. The Pythi of old were famous for charming and destroying serpents†. Some moderns pretend to the same art. Casaubon says that he knew a man who could at any time summon 100 serpents together, and draw them into the fire. Upon a certain occasion, when one of them, bigger than the rest, would not be brought in, he only repeated his charm, and it came forward, like the rest, to submit to the flames. Philostratus describes particularly how the Indians charm serpents. "They take a scarlet robe, embroidered with golden letters, and spread it before a serpent's hole. The golden letters have a fascinating power; and by looking stedfastly, the serpent's eyes are overcome and laid asleep." These and many other feats have been often practised upon these animals by artful men, who had first prepared the serpents for their exercise, and then exhibited them as adventiciously assembled at their call. In India there is nothing so common as dancing serpents, which are carried about in a broad flat vessel, somewhat resembling a sieve. These erect and put themselves in motion at the word of command. When their keeper sings a slow tune, they seem by their heads to keep time; when he sings a quicker measure, they appear to move more brisk and lively. All animals have a certain degree of docility; and we find that serpents themselves can be brought to move and approach at the voice of their master. From this trick, successfully practised before the ignorant, it is most probable has arisen most of the boasted pretensions which some have made to charming of serpents; an art to which the native Americans pretend at this very day, but the existence of which we are assured of by Mr Hasselquist amongst the native Egyptians.

Though the generality of mankind regard this formidable race with horror, yet there have been some nations, and there are some at this day, that consider them with veneration and regard. The adoration paid by the ancient Egyptians to a serpent, is well known: many of the nations at present along the western coast of Africa retain the same unaccountable veneration. Upon the gold and slave coasts, a stranger, upon entering the cottages of the natives, is often surprised to see the roof swarming with serpents, that cling there without molesting and unmolested by the natives. But his surprise will increase upon going farther southward to the kingdom of Widah, when he finds that a serpent is the god of the country. This animal, which travellers describe as a huge overgrown creature, has its habitation, its temple, and its priests. These impress the vulgar with an opinion of its virtues; and numbers are daily seen to offer not only their goods, their provisions, and their prayers, at the shrine of their hideous deity, but also their wives and daughters. These the priests readily accept of, and after some days of penance, return them to their supplicants, much benefited by the serpent's supposed embraces.

SERPENT, a musical instrument, serving as a basis to the cornet or small shawm, to sustain a chorus of fingers in a large edifice.—It has its name *serpent*, from its figure; as consisting of several folds or wreaths, which serve to reduce its length, which would otherwise be six or seven feet.—It is usually covered with leather; and consists of three parts, a mouth-piece, a

neck, and a tail. It has six holes, by means whereof it takes in the compass of two octaves.

SERPENT-Stones. See CORNU AMMONIS.

SEA-SERPENT. See SEA-Serpent.

SERPENTARIA, SNAKE-ROOT; a species of *ARISTOLOCHIA*.

SERPENTARIUS, in astronomy, a constellation of the northern hemisphere, consisting, according to different authors, of 25, 29, or even 69 stars.

SERPENTINE, in general, denotes any thing that resembles a serpent; hence the worm or pipe of a still, twisted in a spiral manner, is termed a *serpentine* *worm*.

SERRATED, in general, something indented or notched in the manner of a saw; a term much used in the description of the leaves of plants. See *BOTANY*, p. 1296.

SERRATULA, SAW-WORT; a genus of the polygamia aequalis order, belonging to the syngenesia class of plants. There are 16 species; the most remarkable of which are, 1. The tinctoria, or dyer's saw-wort, growing naturally in woods and pastures in many places of Britain. The leaves are lyre-shaped, with winged clefts; the terminating segment very large; the florets uniform: blossoms purple, but sometimes white. This is much used by the dyers to give a yellow colour; but being inferior to the yellow-weed, its use is confined to the coarser woollen cloths.—Goats eat it; horses are not fond of it; sheep, swine, and cows, refuse it. 2. The arvensis, corn saw-wort, or way-thistle, has toothed, thorny leaves; blossoms, pale purple. It grows wild in corn-fields and road-sides, and is said to yield a very pure fixed alkali when burnt. Goats eat it; neither cows, horses, sheep, nor swine, are fond of it.

SERRATUS, in anatomy, a name given to several muscles, from their resemblance to a saw. See *ANATOMY*, *Table of the Muscles*.

SERVANT, a term of relation, signifying a person who owes and pays obedience for a certain time to another in quality of a master.

As to the several sorts of servants: It was observed, under the article *LIBERTY*, that pure and proper slavery does not, nay cannot, subsist in Britain; such, we mean, whereby an absolute and unlimited power is given to the master over the life and fortune of the slave. And indeed it is repugnant to reason, and the principles of natural law, that such a state should subsist any where. The three origins of the right of slavery, assigned by Justinian, are all of them built upon false foundations. As, first, slavery is held to arise *jure gentium*, from a state of captivity in war; whence slaves are called *mancipia*, *quasi manu capti*. The conqueror, say the civilians, had a right to the life of his captive; and, having spared that, has a right to deal with him as he pleases. But it is an untrue position, when taken generally, that, by the law of nature or nations, a man may kill his enemy: he has only a right to kill him in particular cases; in cases of absolute necessity, for self-defence; and it is plain this absolute necessity did not subsist, since the victor did not actually kill him, but made him prisoner. War is itself justifiable only on principles of self-preservation; and therefore it gives no other right over prisoners, but merely to disable them from doing harm to us, by confining their persons: much less

Servant.

can it give a right to kill, torture, abuse, plunder, or even to enslave, an enemy, when the war is over. Since, therefore, the right of making slaves by captivity, depends on a supposed right of slaughter, that foundation failing, the consequence drawn from it must fail likewise. But, 2dly, it is said, that slavery may begin *jure civitatis* when one man sells himself to another. This, if only meant of contracts to serve or work for another, is very just: but when applied to strict slavery, in the sense of the laws of old Rome or modern Barbary, is also impossible. Every sale implies a price, a *quid pro quo*, an equivalent given to the seller in lieu of what he transfers to the buyer: but what equivalent can be given for life and liberty, both of which (in absolute slavery) are held to be in the master's disposal? His property also, the very price he seems to receive, devolves *ipso facto* to his master, the instant he becomes his slave. In this case, therefore, the buyer gives nothing, and the seller receives nothing: of what validity, then, can a sale be, which destroys the very principles upon which all sales are founded? Lastly, we are told, that besides these two ways by which slaves *hant*, or are acquired, they may also be hereditary: *servi nascuntur*, the children of acquired slaves are, *jure nature*, by a negative kind of birthright, slaves also. But this, being built on the two former rights, must fall together with them. If neither captivity, nor the sale of one's self, can by the law of nature and reason reduce the parent to slavery, much less can they reduce the offspring.

Upon these principles the law of England abhors, and will not endure the existence of, slavery within this nation: so that, when an attempt was made to introduce it, by statute i. Edw. VI. c. 3, which ordained, that all idle vagabonds should be made slaves, and fed upon bread, water, or small drink, and refuse-meat; should wear a ring of iron round their necks, arms, or legs; and should be compelled, by beating, chaining, or otherwise, to perform the work assigned them, were it ever so vile; the spirit of the nation could not brook this condition, even in the most abandoned rogues; and therefore this statute was repealed in two years afterwards. And now it is laid down, that a slave or negro, the instant he lands in Britain, becomes a freeman; that is, the law will protect him in the enjoyment of his person, and his property. Yet, with regard to any right which the master may have lawfully acquired to the perpetual service of John or Thomas, this will remain exactly in the same state as before: for this is no more than the same state of subjection for life, which every apprentice submits to for the space of seven years, or sometimes for a longer term. Hence, too, it follows, that the infamous and unchristian practice of withholding baptism from negro-servants, lest they should thereby gain their liberty, is totally without foundation, as well as without excuse. The law of England acts upon general and extensive principles: it gives liberty, rightly understood, that is, protection, to a Jew, a Turk, or a Heathen, as well as to those who profess the true religion of Christ; and it will not dissolve a civil obligation between master and servant, on account of the alteration of faith in either of the parties: but the slave is entitled to the same protection in England before, as after baptism; and, whatever service the Heathen negro owed of right to

Blackf.
Comment.

his American master, by general, not by local law, the same (whatever it be) is he bound to render when brought to England and made a Christian.

1. The first sort of servants, therefore, acknowledged by the laws of England, are *menial servants*; so called from being *intra mania*, or domestics. The contract between them and their masters arises upon the hiring. If the hiring be general, without any particular time limited, the law construes it to be a hiring for a year; upon a principle of natural equity, that the servant shall serve, and the master maintain him, throughout all the revolutions of the respective seasons; as well when there is work to be done, as when there is not: but the contract may be made for any larger or smaller term. All single men between 12 years old and 60, and married ones under 30 years of age, and all single women between 12 and 40, not having any visible livelihood, are compellable by two justices to go out to service in husbandry or certain specific trades, for the promotion of honest industry: and no master can put away his servant, or servant leave his master, after being so retained, either before or at the end of his term, without a quarter's warning; unless upon reasonable cause, to be allowed by a justice of the peace: but they may part by consent, or make a special bargain.

2. Another species of servants are called *apprentices*, (from *apprendre*, to learn); and are usually bound for a term of years, by deed indented or indentures, to serve their masters, and be maintained and instructed by them. This is usually done to persons of trade, in order to learn their art and mystery; and sometimes very large sums are given with them, as a premium for such their instruction: but it may be done to husbandmen, nay to gentlemen, and others. And children of poor persons may be apprenticed out by the overseers, with consent of two justices, till 24 years of age, to such persons as are thought fitting; who are also compellable to take them: and it is held, that gentlemen of fortune, and clergymen, are equally liable with others to such compulsion: for which purposes our statutes have made the indentures obligatory, even though such parish-apprentice be a minor. Apprentices to trades may be discharged on reasonable cause, either at the request of themselves or masters, at the quarter-sessions, or by one justice, with appeal to the sessions; who may, by the equity of the statute, if they think it reasonable, direct restitution of a rateable share of the money given with the apprentice: and parish-apprentices may be discharged in the same manner, by two justices. But if an apprentice, with whom less than 10 pounds hath been given, runs away from his master, he is compellable to serve out his time of absence, or make satisfaction for the same, at any time within seven years after the expiration of his original contract.

3. A third species of servants are *labourers*, who are only hired by the day or the week, and do not live *intra mania*, as part of the family; concerning whom the statutes before-cited have made many very good regulations: 1. Directing that all persons who have no visible effects may be compelled to work: 2. Defining how long they must continue at work in summer and in winter: 3. Punishing such as leave or desert their master: 4. Empowering the justices at sessions, or the sheriff of the county, to settle their wages: and,

Servant.

Servetists and, 5. Inflicting penalties on such as either give or exact more wages than are so settled.

Servia.

4. There is yet a fourth species of servants, if they may be so called, being rather in a superior, a ministerial, capacity; such as *stewards, factors, and bailiffs*: whom, however, the law considers as servants *pro tempore*, with regard to such of their acts as affect their master's or employer's property.

As to the manner in which this relation affects the master, the servant himself, or third parties, see the article *MASTER and Servant*.

For the condition of servants by the law of Scotland, see *Law*, N° clxi. 34, 35.

SERVETISTS, a name given to the modern Antitrinitarians, from their being supposed to be the followers of Michael Servetus; who, in the year 1553, was burnt at Geneva, together with his books.

SERVETUS (Michael), an ingenious and learned Spaniard, born in 1509 at Villeneuve in Arragon. He studied the civil law at Toulouse, where he began to read the Scriptures, and to be fond of Antitrinitarian notions; so that after he had been two or three years there, he resolved to retire into Germany and set up for a reformer. He there printed two tracts, *De Trinitatis erroribus*, and *Dialogorum de Trinitate libri duo*; which raised a great tumult among the German divines, and spread his name throughout Europe. After publishing these works, Servetus returned to Paris, where he studied physic, and was admitted a doctor of physic into the university there. All this while Calvin the reformer, who was the head of the church at Geneva, kept up a correspondence with Servetus by letters; for he tells us, that he endeavoured for the space of sixteen years to reclaim that physician from his errors. Servetus consulted him on many occasions, and sent him a MS. to have his opinion of it; a confidence which Calvin made an ungenerous and base use of: for he sent this MS. together with the letters he had received from him, containing heretical opinions, to the magistrates of Lyons, where Servetus resided, who thereupon distressed him. This unfortunate man made his escape, and fled to Vienne in Dauphiny; but there, by means of Calvin's correspondence with some principal divines, he was put in prison. Calvin now, under pretence of a reconciliation, invited him, when he was set at liberty, to retire to Geneva: but he was scarce arrived there, when, to the eternal disgrace of that reformer, he accused him of heresy; and by continual preachings and declamations on the danger the true religion was in from such impostors, he hurried the magistrates into an unjust sentence against him; which was as cruelly executed, for he was burnt alive in 1553.

—Servetus was a man of great acuteness, of prodigious learning, and so admirably skilled in his own profession, that he appears to have had some obscure conception of the circulation of the blood. There are several of his books extant; the scarcest of which are, 1. *De Trinitatis Erroribus*, lib. vii. 2. *Dialogorum de Trinitate*, lib. ii. 3. *De Justitia Regni Christi Capitula*, lib. iv. These works are very scarce, because both Calvin and the Papists took great pains in burning all the copies they could find.

SERVIA, a province of Turkey in Europe, bounded on the north by the rivers Danube and Save, which

separate it from Hungary; on the east, by Bulgaria; on the west, by Bosnia; and on the south, by Albania and Macedonia. It is about 190 miles in length from east to west; 95 in breadth from north to south; and is divided into four sangiacates. Two of these were ceded to the Christians in 1718, who united them into one. This continued till 1739, when the Turks were victorious; and then they were abandoned to the Turks by the treaty of Belgrade. Belgrade is the capital town.

SERVICE, in law, is a duty which a tenant, on account of his fee, owes to his lord.

There are many divisions of services; as, 1. Into personal, where something is to be done by the tenant in person, as homage and fealty. 2. Real, such as wards, marriages, &c. 3. Accidental, including heriots, reliefs, and the like. 4. Entire, where, on the alienation of any part of the lands by a tenant, the services become multiplied. 5. Frank-service, which was performed by freemen, who were not obliged to perform any base service, but only to find a man and horse to attend the lord into the army or to court. 6. Knight's service, by which lands were anciently held of the king, on paying homage, service in war, &c.

SERVICE-Tree. See *SORBUS*.

SERVITES, a religious order in the church of Rome, founded about the year 1233, by seven Florentine merchants, who, with the approbation of the bishop of Florence, renounced the world, and lived together in a religious community on mount Senar, two leagues from that city.

SERVITOR, in the university of Oxford, a student who attends on another for his maintenance and learning.

SERVITUDE, the condition of a servant, or rather slave.

SERVITUDE, in Scots law. See there, N° clxx.

SERVUS (Maurus Honoratus), a celebrated grammarian and critic of antiquity, who flourished about the time of Arcadius and Honorius; now chiefly known by his *Commentaries on Virgil*. There is also extant a piece of Servius upon the feet of verses and the quantity of syllables, called *Centimetrum*.

SERUM, a thin, transparent, saltish liquor, which makes a considerable part of the mass of blood. See *ANATOMY*, N° 389. *AIR*, N° 48, and *BLOOD*.

SESAMOIDEA ossa, certain small bones somewhat resembling the seeds of sesamum, whence their name. They are placed at the under part of the bones of the last joints of the fingers and toes.

SESAMUM, ONLY GRAIN, in botany, a genus of the angiospermia order, belonging to the didynamia class of plants. The species are, 1. The orientale, with oblong, oval, entire bases: it is cultivated in great plenty in the Levant, but is supposed to have been brought there from India. It is an annual plant, rising with an herbaceous four cornered stalk, two feet high, sending out a few short side-branches; the leaves are oblong, oval, a little hairy, and stand opposite. The flowers terminate the stalks in loose spikes; they are small, of a dirty white colour, shaped somewhat like those of the foxglove. After the flowers are past, the germin turns to an oval acute-pointed capsule with four cells, filled with oval compressed seeds, which ripen in autumn. 2. The indicum, with trifid lower leaves, grows naturally in India: this is also an annual

nual plant; the stalk rises taller than that of the former; the lower leaves are cut into three parts, which is the only difference between them. 3. The trifolium, with all the leaves trifid; grows naturally in Africa. This is also an annual plant, with a taller and more branched stalk than that of the former, in which it differs from both the other.

The first sort is frequently cultivated in all the eastern countries, and also in Africa, as a pulse; and of late years the seeds have been introduced into Carolina by the African negroes, where they succeed extremely well. The inhabitants of that country make an oil from the seed, which will keep good many years, without having any rancid smell or taste, but in two years becomes quite mild; so that when the warm taste of the seed, which is in the oil when first drawn, is worn off, they use it as a salad-oil, and for all the purposes of sweet oil. The seeds of this plant are also used by the negroes for food; which seeds they parch over the fire, and then mix them with water, and stew other ingredients with them, which makes an hearty food. Sometimes a sort of pudding is made of these seeds, in the same manner as with millet or rice, and is by some persons esteemed, but is rarely used for these purposes in Europe. This is called *benny*, or *benny*, in Carolina. In England these plants are preferred in botanic gardens as curiosities. Their seeds must be sown in the spring upon a hot-bed; and when the plants are come up, they must be transplanted into a fresh hot-bed to bring them forward. After they have acquired a tolerable degree of strength, they should be planted into pots, and plunged into another hot-bed, managing them as hath been directed for amaranthuses; for if these plants are not thus brought forward in the former part of the summer, they will not produce good seeds in this country.

The seeds of the first sort is mentioned in the list of official simples in the college dispensatory, but is rarely used in medicine in England. From nine pounds of this seed which came from Carolina, there were upwards of two quarts of oil drawn, which is as great a quantity as hath been obtained from any vegetable whatever. This might occasion its being called the *oily grain*.

SESOSTRIS, king of Egypt or Ramefes. Of the eight kings of the 16th dynasty there were six of the name of Sesostris or Ramefes; and it was upon the death of Ramefes Miriam, the great persecutor of the Jews in Egypt, that they were delivered from their first captivity: but it is supposed that the Egyptian priests have ascribed the various, real or fictitious, exploits of several of these princes to one man, under the name of *Sesostris Ramefes Miriam*. Sir Isaac Newton supposes the great Sesostris to have been the same with Shishak, who plundered Jerusalem after the death of Solomon. See *EGYPT*, n° 3—5.

SESQUĪ, a Latin particle, signifying a whole and a half; which, joined with *altera*, *terza*, *quarta*, &c. is much used in the Italian music to express a kind of ratios, particularly several species of triples.

SESSILE, among botanists. See *BOTANY*, p. 1296.

SESSION, in general, denotes each sitting or assembly of a council, &c.

Session of Parliament, is the season or space from its meeting to its prorogation. See *PARLIAMENT*,

Court of Session. See *LAW*, N° clvii. 4.

Court of Quarter-Sessions, an English court that must be held in every county once in every quarter of a year; which, by statute 2 Hen. V. c. 4. is appointed to be in the first week after Michaelmas-day, the first week after the epiphany, the first week after the close of Easter, and in the week after the translation of St Thomas the martyr, or the 7th of July. It is held before two or more justices of the peace, one of which must be of the quorum. The jurisdiction of this court, by 34 Edw. III. c. 1. extends to the trying and determining all felonies and trespasses whatsoever: though they seldom, if ever, try any greater offence than small felonies within the benefit of clergy; their commission providing, that if any case of difficulty arises, they shall not proceed to judgment, but in the presence of one of the justices of the courts of king's-bench or common-pleas, or one of the judges of assize: and therefore murders, and other capital felonies, are usually remitted for a more solemn trial to the assizes. They cannot also try any new-created offence, without express power given them by the statute which creates it. But there are many offences and particular matters which, by particular statutes, belong properly to this jurisdiction, and ought to be prosecuted in this court; as, the smaller misdemeanors against the public or commonwealth, not amounting to felony; and especially offences relating to the game, highways, alehouses, bastard children, the settlement and provision for the poor, vagrants, servants wages, and Popish recusants. Some of these are proceeded upon by indictment: others in a summary way, by motion, and order thereupon; which order may for the most part, unless guarded against by particular statutes, be removed into the court of king's bench by writ of *certiorari facias*, and be there either quashed or confirmed. The records or rolls of the sessions are committed to the custody of a special officer, denominated *custos rotulorum*, who is always a justice of the quorum; and among them of the quorum (saith Lambard) a man for the most part especially picked out, either for wisdom, countenance, or credit. The nomination of the *custos rotulorum* (who is the principal officer in the county, as the lord lieutenant is chief in military command) is by the king's sign-manual: and to him the nomination of the clerk of the peace belongs; which office he is expressly forbidden to sell for money.

In most corporation-towns there are quarter-sessions kept before justices of their own, within their respective limits; which have exactly the same authority as the general quarter-sessions of the county, except in a very few instances; one of the most considerable of which is the matter of appeals from orders of removal of the poor, which, though they be from the orders of corporation-justices, must be to the sessions of the county, by statute 8 and 9 W. III. c. 30. In both corporations and counties at large, there is sometimes kept a special or petty session, by a few justices, for dispatching smaller business in the neighbourhood between the times of the general sessions; as for licensing alehouses, passing the account of parish-officers, and the like.

SESTERCE, *sestertius*, a silver coin in use among the Romans.

Sestos
Sethians.

Setimo
Severn.

Some authors make two kinds of festerces; the less, called *sestertius*, in the masculine gender; and the great one, called *sestertium*, in the neuter; the latter containing a thousand of the other. Others will have any such distinction of great and little festerces unknown to the Romans. *Sestertius*, say they, was an adjective, and signified *as sestertius*, or two ases and an half; and when used plurally, as in *quinquaginta sestertium*, or *sestertia*, it was only by way of abbreviation, and there was always understood *millia* or thousands.

SESTERCE, or *sestertius*, was also used by the ancients for a thing containing two wholes and an half of another, as *as* was taken for any whole or integer.

SESTOS, a noted fortress of European Turkey, situated at the entrance of the Hellespont or Dardanelles, 24 miles south-west of Gallipoli. This place is famous for the loves of HERO and LEANDER, sung by the poet Muses.

SET, or SEES, a term used by the farmers and gardeners to express the young plants of the white thorn and other shrubs, with which they use to raise their quick or quickest hedges.

SETACEOUS WORM, in natural history, a name given by Dr Lister to that long and slender water-worm, which so much resembles a horse-hair, that it has been supposed by the vulgar to be an animated hair of that creature. These creatures, supposed to be living hairs, are a peculiar sort of insects, which are bred and nourished within the bodies of other insects, as the worms of the ichneumon flies are in the bodies of the caterpillars.

Aldrovand describes the creature, and tells us it was unknown to the ancients; but called *seta aquatica*, and *vermis setarius*, by the moderns, either from its figure resembling that of a hair, or from the supposition of its once having been the hair of some animal. We generally suppose it, in the imaginary state of the hair, to have belonged to a horse; but the Germans say it was once the hair of a calf, and call it by a name signifying *villus aquaticus*, or the "water-calf."

Albertus, an author much revered by the common people, has declared that this animal is generated of a hair; and adds, that any hair thrown into a standing water, will, in a very little time, obtain life and motion. Other authors have differed from this opinion, and supposed them generated of the fibrous roots of water-plants; and others, of the parts of grasshoppers fallen into the water. This last opinion is rejected by Aldrovand as the most improbable of all; yet in reality it comes nearest the truth of any of them. Standing and foul waters are most plentifully stored with them; but they are sometimes found in the clearest and purest springs, and sometimes out of the water, on the leaves of trees and plants, as on the fruit-trees in our gardens, and the elms in hedges. They are from three to five inches long, of the thickness of a large hair; and are brown upon the back, and white under the belly, and the tail is white on every part.

SETH, the third son of Adam, the father of Enos, was born 3874 B. C. and lived 912 years.

SETHIANS, in church-history, Christian heretics; so called because they paid divine worship to Seth, whom they looked upon to be Jesus Christ the son of God, but who was made by a third divinity, and substituted in the room of the two families of Abel and

Cain, which had been destroyed by the deluge. These heretics appeared in Egypt in the second century; and as they were addicted to all sorts of debauchery, they did not want for followers; and continued in Egypt above 200 years.

SETIMO, a town of Italy in the province of Piedmont, situated on the river Po, eight miles north of Turin.

SETON, in surgery, a few horse-hairs, small threads, or large packthread, drawn through the skin, chiefly the neck, by means of a large needle or probe, with a view to restore or preserve health.

We find by experience, that setons are very useful in catarrhs, inflammations, and other disorders, particularly those of the eyes, as a gutta serena, cataract, and incipient suffusion; to those we may add intense headaches, with stupidity, drowsiness, epilepsies, and even the apoplexy itself.

SETTING, in astronomy, the withdrawing of a star or planet, or its sinking below the horizon. Astronomers and poets make three different kinds of setting of the stars, viz. the COSMICAL, ACRONYCAL, and HELIACAL. See these articles.

SETTING, in the sea-language. To set the land or the sun by the compass, is to observe how the land bears on any point of the compass, or on what point of the compass the sun is. Also when two ships sail in sight of one another, to mark on what point the chased bears, is termed *setting the chase by the compass*.

SETTING, among sportsmen, a term used to express the manner of taking partridges by means of a dog peculiarly trained to that purpose. See SHOOTING.

SEVENTH, in music, an interval called by the Greeks *heptachordon*. See INTERVAL.

SEVERIA, a province of the Russian empire, with the title of a duchy, bounded on the north by Smolensko and Muscovy, on the east by Vorotinski and the country of the Cossacks, on the south by the same, and on the west by Zerogovia. It is a country overrun with woods, and on the south part is a forest of great length. Novogrodec, or Novogorod, is the capital town.

SEVERINA (St.), a town of Italy, in the kingdom of Naples, and in Lower Calabria, with an archbishop's see. It is very well fortified, and seated on a craggy rock, on the river Neeto; in E. Long. 17. 20. N. Lat. 39. 15.

SEVERINO, a town of Italy, in the territory of the church, and in the Marche of Ancona, with a bishop's see. It has fine vineyards, and is seated between two hills on the river Petenza; in E. Long. 13. 20. N. Lat. 43. 10.

SEVERN, a river of England, which rises near Plinnilliom-hill in Montgomeryshire, and before it enters Shropshire receives about 30 streams, and passes down to Lauding, where it receives the Morda, that flows from Oswestry. When it arrives at Shrewsbury, it receives the river Mon; passing on to Morebury, which it almost surrounds; then to Bridgnorth; afterwards it runs through the skirts of Staffordshire, enters Worcestershire, and passes by Worcester: then it runs to Tewksbury, where it joins the Avon; and from thence to Gloucester, keeping a north-westerly course till it falls into the Bristol channel. It begins to be navigable for boats at Welch Pool in Montgomeryshire,

Severus. Thire, and takes in several other rivers in its course besides those already mentioned; it is the second in England.

SEVERUS (Cornelius), an ancient Latin poet of the Augustan age; whose *Ælina*, together with a fragment *De morte Ciceronis*, were published, with notes and a prose interpretation, by Le Clerc, 12mo, Amsterdam, 1703. They were before inserted among the *Calactæa Virgilii* published by Scaliger; whose notes, with others, Le Clerc has received among his own.

SEVERUS (Septimius), a Roman emperor, born at Leptis in Africa. On pretence of revenging the death of the emperor Pertinax, he leapt into his room in 193. He next overcame Pescennius Niger, who was declared emperor by the legions of Syria; and took Byzantium. He conquered the Parthians, Medes, Arabians, &c. and punished the rebelling Jews. After this, he defeated Albinus near Lyons. He began the fifth persecution against the Christians; quelled the Britons rebelling against him, and built the wall that bears his name. He had two sons, Antoninus Caracalla and Geta, both Cæsars. Caracalla had designed, one day as he was marching behind his father, to have stabbed him, and drew his sword to that intent; but was hindered by some that were near him. Severus himself took notice of it, but dissembled his knowledge; yet the horror of so unnatural an attempt cast him into a deep melancholy, of which he died at York in 211. He was a man of wit, understanding, and ability; understood mathematics and history; loved learned men; and wrote the history of his own life.

SEVERUS's Wall, in British topography, the fourth and last barrier erected by the Romans against the incursions of the North Britons. See the articles AGRICOLA, ADRIAN, and ANTONINUS's Wall.

We learn from several hints in the Roman historians, that the country between the walls of Hadrian and Antoninus continued to be a scene of perpetual war and subject of contention between the Romans and Britons, from the beginning of the reign of Commodus to the arrival of the emperor Septimius Severus in Britain, A. D. 206. This last emperor having subdued the Macætzæ, and repulsed the Caledonians, determined to erect a stronger and more impenetrable barrier than any of the former, against their future incursions.

Though neither Dio nor Herodian make any mention of a wall built by Severus in Britain for the protection of the Roman province, yet we have abundant evidence from other writers of equal authority, that he really built such a wall. "He fortified Britain (says Spartian) with a wall drawn cross the island from sea to sea; which is the greatest glory of his reign. After the wall was finished, he retired to the next station (York), not only a conqueror, but founder of an eternal peace." To the same purpose, Aurelius Victor and Orosius, to say nothing of Eutropius and Cassiodorus. "Having repelled the enemy in Britain, he fortified the country, which was suited to that purpose, with a wall drawn cross the island from sea to sea."—"Severus drew a great ditch, and built a strong wall, tised with several turrets, from sea to sea, to protect that part of the island which he had recovered, from the yet unconquered nations." As the residence of the emperor Severus in Britain was not quite four

years, it is probable that the two last of them were employed in building this wall; according to which account, it was begun A. D. 209, and finished A. D. 210.

This wall of Severus was built nearly on the same tract with Hadrian's rampart, at the distance only of a few paces north. The length of this wall, from Coufins-house near the mouth of the river Tyne on the east, to Boulnefs on the Solway frith on the west, hath been found, from two actual mensurations, to be a little more than 68 English miles, and a little less than 74 Roman miles. To the north of the wall was a broad and deep ditch, the original dimensions of which cannot now be ascertained, only it seems to have been larger than that of Hadrian. The wall itself, which stood on the south brink of the ditch, was built of solid stone, strongly cemented with the best mortar; the stones which formed both the faces being square ashlers, and the filling stones large flags, set a little slanting. The height of this wall was 12 feet besides the parapet, and its breadth 8 feet, according to Bede, who lived only at a small distance from the east end of it, and in whose time it was almost quite entire in many places. Such was the wall erected by the command and under the direction of the emperor Severus in the north of England; and, considering the length, breadth, height, and solidity, it was certainly a work of great magnificence and prodigious labour. But the wall itself was but a part, and not the most extraordinary part, of this work. The great number and different kinds of fortresses which were built along the line of it for its defence, and the military-ways with which it was attended, are still more worthy of our admiration, and come now to be described.

The fortresses which were erected along the line of Severus's wall for its defence, were of three different kinds, and three different degrees of strength; and were called by three different Latin words, which may be translated *stations*, *castles*, and *turrets*. Of each of these in their order.

The *stations*, *stations*, were so called from their stability and the stated residence of garrisons. They were also called *castra*, which hath been converted into *cheffres*, a name which many of them still bear. These were by far the largest, strongest, and most magnificent of the fortresses which were built upon the wall, and were designed for the head-quarters of the cohorts of troops which were placed there in garrison, and from whence detachments were sent into the adjoining callies and turrets. These *stations*, as appears from the vestiges of them which are still visible, were not all exactly of the same figure nor of the same dimensions; some of them being exactly squares, and others oblong, and some of them a little larger than others. These variations were no doubt occasioned by the difference of situation and other circumstances. The *stations* were fortified with deep ditches and strong walls, the wall itself coinciding with and forming the north wall of each station. Within the *stations* were lodgings for the officers and soldiers in garrison; the smallest of them being sufficient to contain a cohort, or 600 men. Without the walls of each station was a town, inhabited by labourers, artificers, and others, both Romans and Britons, who chole to dwell under the protection of these fortresses. The number of the *stations* upon the

the wall was exactly 18; and if they had been placed at equal distances, the interval between every two of them would have been four miles and a few paces: but the intervention of rivers, marshes, and mountains; the convenience of situation for strength, prospect, and water; and many other circumstances to us unknown, determined them to place these stations at unequal distances. The situation which was always chosen by the Romans, both here and everywhere else in Britain where they could obtain it, was the gentle declivity of a hill, near a river, and facing the meridian sun. Such was the situation of the far greatest part of the stations on this wall. In general we may observe, that the stations stood thickest near the two ends and in the middle, probably because the danger of invasion was greatest in these places. But the reader will form a clearer idea of the number of these stations, their Latin and English names, their situation and distance from one another, by inspecting the following table, than we can give him with equal brevity in any other way. The first column contains the number of the station, reckoning from east to west; the second contains its Latin, and the third its English name; and the three last its distance from the next station to the west of it, in miles, furlongs, and chains.

| N ^o | Latin Name. | English Name. | M. | F. | C. |
|--------------------|-------------|------------------|----|----|----|
| 1 | Segedunum | Cousins'-house | 3 | 5 | 1½ |
| 2 | Pons Ælii | Newcastle | 2 | 0 | 9 |
| 3 | Condercum | Benwell-hill | 6 | 6 | 5 |
| 4 | Vindobala | Rutchester | 7 | 0 | 3½ |
| 5 | Hannum | Halton-chesters | 5 | 1 | 7 |
| 6 | Cilurnum | Walwick-chesters | 3 | 1 | 8 |
| 7 | Procolitia | Carrawburgh | 4 | 5 | 3½ |
| 8 | Borcovius | Houfesteeds | 1 | 3 | 8 |
| 9 | Vindolana | Little-chesters | 3 | 6 | 4 |
| 10 | Ælica | Great-chesters | 2 | 1 | 6½ |
| 11 | Magna | Cartvoran | 2 | 6 | 0 |
| 12 | Amboglanna | Burdoswald | 6 | 2 | 8 |
| 13 | Petrianæ | Cambeck | 2 | 6 | 6 |
| 14 | Atallaba | Watchcros | 5 | 1 | 9 |
| 15 | Convagata | Stanwix | 3 | 3 | 4 |
| 16 | Axelodunum | Brugh | 4 | 0 | 9 |
| 17 | Gabrofantum | Brumbrugh | 3 | 4 | 1 |
| 18 | Tunnocelum | Boulnefs | 0 | 0 | 0 |
| Length of the wall | | | 68 | 3 | 3 |

The *castella*, or castles, were the second kind of fortifications which were built along the line of this wall for its defence. These castles were neither so large nor strong as the stations, but much more numerous, being no fewer than 81. The shape and dimensions of the castles, as appears from the foundations of many of them which are still visible, were exact squares of 66 feet every way. They were fortified on every side with thick and lofty walls, but without any ditch, except on the north side; on which the wall itself, raised much above its usual height, with the ditch attending it, formed the fortification. The castles were situated in the intervals between the stations, at the distance of about seven furlongs from each other; though in this, particular circumstances sometimes occasioned a little variation. In these castles guards were constantly

kept by a competent number of men detached from the nearest stations.

The *turrets*, or turrets, were the third and last kind of fortifications on the wall. These were still much smaller than the castles, and formed only a square of about 12 feet, standing out of the wall on its south side. Being so small, they are more entirely ruined than the stations and castles, which makes it difficult to discover their exact number. They stood in the intervals between the castles; and from the faint vestiges of a few of them, it is conjectured that there were four of them between every two castles, at the distance of about 300 yards from one another. According to this conjecture, the number of the turrets amounted to 324. They were designed for watch-towers and places for centinels, who, being within hearing of one another, could convey an alarm or intelligence to all parts of the wall in a very little time.

Such were the stations, castles, and turrets on the wall of Severus; and a very considerable body of troops was constantly quartered in them for its defence. The usual complement allowed for this service was as follows:

1. Twelve cohorts of foot, consisting of 600 men each 7,200
2. One cohort of mariners in the station at Boulnefs 600
3. One detachment of Moors, probably equal to a cohort 600
4. Four alæ or wings of horse, consisting, at the lowest computation, of 400 each 1,600

10,000

For the convenience of marching these troops from one part of the wall to another, with the greater ease and expedition, on any service, it was attended with two military ways, paved with square stones, in the most solid and beautiful manner. One of these ways was smaller, and the other larger. The smaller military way ran close along the south side of the wall, from turret to turret, and castle to castle, for the use of the soldiers in relieving their guards and centinels, and such services. The larger way did not keep so near the wall, nor touch at the turrets or castles, but pursued the most direct course from one station to another, and was designed for the convenience of marching larger bodies of troops.

It is to be regretted, that we cannot gratify the reader's curiosity, by informing him by what particular bodies of Roman troops the several parts of this great work were executed; as we were enabled to do with regard to the wall of Antoninus Pius from inscriptions. For though it is probable that there were stones with inscriptions of the same kind, mentioning the several bodies of troops, and the quantity of work performed by each of them, originally inserted in the face of this wall, yet none of them are now to be found. There have indeed been discovered, in or near the ruins of this wall, a great number of small square stones, with very short, and generally imperfect, inscriptions upon them; mentioning particular legions, cohorts, and centuries; but without directly asserting that they had built any part of the wall, or naming any number of paces. Of these inscriptions, the reader

reader may see no fewer than twenty-nine among the Northumberland and Cumberland inscriptions in Mr Horsley's *Britannia Romana*. As the stones on which these inscriptions are cut, are of the same shape and size with the other facing-stones of this wall, it is almost certain that they have been originally placed in the face of it. It is equally certain, from the uniformity of these inscriptions, that they were all intended to intimate some one thing, and nothing so probable as that the adjacent wall was built by the troops mentioned in them. This was, perhaps, so well understood, that it was not thought necessary to be expressed; and the distance of these inscriptions from one another showed the quantity of work performed. If this was really the case, we know in general, that this great work was executed by the second and sixth legions, these being the only legions mentioned in these inscriptions. Now, if this prodigious wall, with all its appendages of ditches, stations, castles, turrets, and military ways, was executed in the space of two years by two legions only, which, when most complete, made no more than 12,000 men, how greatly must we admire the skill, the industry, and excellent discipline of the Roman soldiers, who were not only the valiant guardians of the empire in times of war, but its most active and useful members in times of peace?

This wall of Severus, and its fortresses, proved an impenetrable barrier to the Roman territories for near 200 years. But about the beginning of the 5th century, the Roman empire being assailed on all sides, and the bulk of their forces withdrawn from Britain, the Meatz and Caledonians, now called Scots and Picts, became more daring; and some of them breaking through the wall, and others sailing round the ends of it, they carried their ravages into the very heart of Provincial Britain. These invaders were indeed several times repulsed after this by the Roman legions sent to the relief of the Britons. The last of these legions, under the command of Gallio of Ravenna, having, with the assistance of the Britons, thoroughly repaired the breaches of Severus's wall and its fortresses, and exhorted the Britons to make a brave defence, took their final farewell of Britain. It soon appeared, that the strongest walls and ramparts are no security to an undisciplined and dastardly rabble, as the unhappy Britons then were. The Scots and Picts met with little resistance in breaking through the wall, whose towns and castles were tamely abandoned to their destructive rage. In many places they levelled it with the ground, that it might prove no obstruction to their future inroads. From this time no attempts were ever made to repair this noble work. Its beauty and grandeur procured it no respect in the dark and tasteless ages which succeeded. It became the common quarry for more than a thousand years, out of which all the towns and villages around were built; and is now so entirely ruined, that the penetrating eyes of the most poring and patient antiquarian can hardly trace its vanishing foundations.

SEVIGNE (Marie de Rabutin, Marquise de), a French lady, celebrated for her wit and her fine sense, was born in 1626, and was not above a year old when her father was killed at the defeat of the English upon the isle of Rhe. In 1644, she married the mar-

quis of Seigne, who was killed in a duel in 1651. She had by him a son and a daughter; to the care of whose education the afterwards most religiously devoted herself: they became accordingly most accomplished persons, as it was reasonable to expect. This illustrious lady was acquainted with all the wits and learned of her time. It is said she decided the famous dispute between Perrault and Boileau, concerning the preference of the ancients to the moderns, thus: "The ancients are the finest, and we are the prettiest." She died in 1696, and left us a most valuable collection of letters; the best edition of which is that of Paris 1754, in eight volumes 12mo. "These letters," says Voltaire, "filled with anecdotes, written with freedom, and in a natural and animated style, are an excellent criticism upon studied letters of wit, and still more upon those fictitious letters which aim to imitate the epistolary style, by a recital of false sentiments and feigned adventures to imaginary correspondents." A *Sevigniana* was published at Paris in 1756; which is nothing more than a collection of literary and historical anecdotes, fine sentiments, and moral apophthegms, scattered throughout these letters.

SEVILLE, a large and populous city of Spain, situated on the Guadalquivir river, in W. Long. 5. 5. N. Lat. 37. 20. This city is supposed to have been founded by the Phœnicians, who gave it the name of *Hispalis*. When it fell under the power of the Romans, it was called *Julia*: and at last, after a variety of corruptions, was called *Sevilla* or *Sevilla*; both of which names are retained by the Spaniards. The Romans embellished it with many magnificent edifices; of which scarce any vestige now remains. The Gothic kings for some time made it their residence: but in process of time they removed their court to Toledo; and Seville was taken by storm soon after the victory obtained at Xeres over the Gothic king Rodrigo. In 1027, Seville became an independent monarchy; but was conquered 70 years afterwards by Yusuf Almoravides, an African prince. At last it was taken by Ferdinand III. after a year's siege; and 300,000 Moors were then obliged to leave the place. Notwithstanding this prodigious emigration, Seville continued to be a great and populous city, and soon after it was enlarged and adorned with many magnificent buildings, the chief of which is the cathedral. Seville arrived at its utmost pitch of grandeur a little after the discovery of America, by reason that all the valuable productions of the West Indies were brought hither. Its court was then the most splendid in Europe; but in the course of a few years all this grandeur disappeared, owing to the impediments in navigating the Guadalquivir. The superior excellence of the port of Cadiz induced government to order the galleons to be stationed there in time to come.

The shape of Seville is circular, without any great rising in the whole space. The walls seem to be of Moorish construction, and are about five miles and an half in circumference. The ditch is filled up in many places. On the west side of the river is a suburb called *Triana*, as large as many towns, but remarkable for nothing but its Gothic castle; where, in 1482, the inquisition was first established in Spain.

The streets of Seville are crooked, dirty, and narrow; so that two coaches can scarcely pass one another

Seville.
Sewell.

ther abreast. The widest and handomest place is called the *Alameda*, or *Great Walk of Old Elms*, in the heart of the city. The length of this is 600 yards, and its breadth 150; decorated with three fountains, the statues of Hercules the suppoed founder, and of Julius Cæsar the restorer, of Seville. The cathedral is 420 feet by 273 within, and 126 feet high; the circumference of each cluster of pillars, 42 feet. It has nine doors, 80 windows, and 80 altars, at which 500 masses are daily celebrated. At one angle stands the Giralda, a tower 350 feet high, erected by the Moors in the year 1000. The Christians added two stories, with a prodigious large weathercock; and as the whole rises much higher than any other edifice in Seville, it has a noble effect. According to tradition, the Moors, in order to form a solid foundation for this edifice, made a deep hole, in which they cast all the marble and stone monuments of the Romans that could be found; and indeed, when repairs have been necessary, this tradition seems to have been countenanced by the many monuments of antiquity discovered on such occasions. The whole work is brick and mortar, with a winding stair-case within, so easy and wide, as to admit two horsemen riding abreast above half way up. The other churches are unworthy of notice; and even the cathedral, according to Mr Swinburne, is inferior to York Minster. This cathedral was begun by Don Sancho the Brave about the close of the 13th century, and finished by John II. about an hundred years after.

The Canos de Carmone, or great aqueduct of Seville, is reckoned, by the historians of this city, one of the most wonderful works of antiquity. Mr Swinburne, however, remarks, that it is ugly, crooked, the arches unequal, and the architecture neglected. The conduit, besides, is so leaky, that a rivulet is formed by the waste water. Nevertheless, it still conveys to the city an ample supply of water sufficient to turn several mills, and to give almost every house in town the benefit of it.

The only other remarkable building about Seville is the snuff-manufactory. For the more convenient carrying on this branch of commerce, Ferdinand VI. erected a most magnificent roomy palace, in a grand, but rather heavy style of architecture, which was finished in 1756. A thousand men are employed constantly here at about four or six reals per day, for nine hours work. One hundred and eighty mules work 28 mills or machines for mixing the tobacco with a red earth from Almazaron. The excessive adulteration with this earth, however, has of late occasioned a prodigious falling off in the exportation of the manufecture: the northern nations have long refused to take any off their hands; and unless they alter their method, the trade will probably soon be confined to Spain and its dominions. The neat profits, for one year, have amounted to more than six millions of dollars.

SEWELL (George), an eminent physician, elegant writer, and excellent poet, was the eldest son of Mr John Sewell treasurer and chapter-clerk of the college of Windsor; and was educated at Eton school, and at Peter-house in Cambridge, where he took the degree of bachelor in physic. In order to complete

his knowledge in medicine, he went to Leyden, and studied under the celebrated Boerhaave; and on his return practised physic in London with good success. Towards the latter part of his life he retired to Hampstead, where he continued to pursue the business of his profession till the time of his death, which happened in the year 1726. He wrote several essays in the Spectators and Tatlers; and was concerned in the translation of Ovid's Metamorphoses, with Dr Garth and others. He likewise wrote, 1. The life of Mr John Philips, author of the poem on cyder. 2. A vindication of the English Stage, exemplified in the Cato of Mr Addison, in a letter to a nobleman. 3. Sir Walter Raleigh, a tragedy: and several miscellaneous poems.

SEWER, in the HOUSEHOLD, an officer who comes in before the meat of a king or nobleman, to place and range it on the table.

SEWER is also a passage or gutter made to carry water into the sea or a river, whereby to preserve the land, &c. from inundations and other annoyances.

Court of Commissioners of SEWERS in England. A temporary tribunal, erected by virtue of a commission under the great seal; which formerly used to be granted *pro re nata* at the pleasure of the crown, but now at the discretion and nomination of the lord chancellor, lord treasurer, and chief justices, pursuant to the statute 23 Hen. VIII. c. 5. Their jurisdiction is to overlook the repairs of sea-banks and sea-walls, and the cleansing of rivers, public streams, ditches, and other conduits, whereby any waters are carried off; and is confined to such county or particular district as the commission shall expressly name. The commissioners are a court of record, and may fine and imprison for contempts; and in the execution of their duty, may proceed by jury, or upon their own view, and may take order for the removal of any annoyances, or the safeguard and conservation of the sewers within their commission, either according to the laws and customs of Romney-marsh, or otherwise at their own discretion. They may also assess such rates or scots upon the owners of lands within their district, as they shall judge necessary: and if any person refuses to pay them, the commissioners may levy the same by distress of his goods and chattels: or they may, by statute 23 Hen. VIII. c. 5. sell his freehold-lands, (and by the 7 Ann. c. 10. his copyhold also), in order to pay such scots or assessments. But their conduct is under the controul of the court of King's Bench, which will prevent or punish any illegal or tyrannical proceedings. And yet in the reign of king James I. (8 Nov. 1616.) the privy-council took upon them to order, that no action or complaint should be prosecuted against the commissioners unless before that board; and committed several to prison who had brought such actions at common law, till they should release the same: and one of the reasons for discharging Sir Edward Coke from his office of lord chief-justice, was for countenancing those legal proceedings.

The pretence for these arbitrary measures was no other than the tyrant's plea of the necessity of unlimited powers in works of evident utility to the public, "the supreme reason above all reasons, which is the salvation of the king's lands and people." But now it

Sewer.

Sex.

is clearly held, that this (as well as all other inferior jurisdictions) is subject to the discretionary coercion of his majesty's court of King's-bench.

SEX, something in the body which distinguishes male from female.

SEX of Bees. See BEE.

SEXES of Plants. Theophrastus, the father of botany, frequently mentions the sexes of plants. He observes, that trees may be distinguished into several classes, on account of their great variety: but that their most common distinction is into *male* and *female*; the one of which is fertile; the other, in some sorts, barren. This distinction of the sexes, however, is not so much founded upon an analogy betwixt vegetables and animals, as upon the greater or less perfection of the fruit in the plants in question. In a species of palm-tree, mentioned by this author and Aristotle, the analogy in question is more strictly preserved. "If the dust of a branch of the male palm (says Aristotle) is shaken over the female, the fruit of the latter will quickly ripen; nay, (continues the same author), if this male dust shall be carried along with the wind, and dispersed upon the female, the same effect will follow as if a branch of the male had been suspended over it." To the same purpose Theophrastus observes, that unless the dust or down of the male palm is sprinkled over the fruit of the female, it will never ripen, but fall off. That these naturalists, however, were not clear in opinion that the fruit so sprinkled with the male dust was impregnated by it in the same manner as the ovary is fecundated in animals, appears from another passage in the last quoted author, in which he asserts, that though the fact just mentioned cannot be denied, yet no reason whatever can be assigned for the effect of the sprinkling.

Dioscorides, the next Greek botanist of note after Theophrastus, denominates many plants male and female, but without regard to analogy, or to their fertility or barrenness. Thus his male mercury carries the seed, and the female is barren. These ideas of the sexes of plants have been transferred to our own times; and it is not uncommon to hear peasants confounding the sexes of hemp, spinage, and hop, by calling the male plant *female*, and the female plant, or that which bears the seeds, *male*.

Aristotle, as well as Dioscorides, errs widely in his manner of distinguishing the male from the female plant; the former of which, in his opinion, is larger and stronger; the female weaker, but more fruitful.

"Naturalists," says Pliny, "admit the distinction of sex, not only in trees, but in herbs and all plants. Yet (continues the same author) this is no where more observable than in palms, the females of which never propagate but when they are fecundated by the dust of the male."

The palm-tree is the only instance among the ancients where sexes are attributed to particular plants on account of fertility or barrenness; other plants being, as we have seen, distinguished into male and female, merely for distinction's sake, and often erroneously. Cæsalpinus was the first who corrected the mistakes of the ancients with respect to the sex of plants, and established what are now generally called orthodox opinions on that subject. He observed, that

in some trees, as yew; and in some herbaceous vegetables, as mercury, hemp, and nettle; the fruit was produced on one root, and flowers only on the other: the last being barren, was denominated the *male plant*; the other being fertile, the *female*. The female plants, continues the same intelligent author, succeed better, that is, become more fruitful, if sowed in the neighbourhood of the male: certain exhalations from the latter dispersing themselves over their surface, and, by an operation not to be explained, disposing them to produce riper and more perfect seeds.

Cæsalpinus's idea of sex in plants was restricted to a very inconsiderable number; those, to wit, in which the pretended organs are placed apart from each other, on separate roots produced from the same seed. In plants of this description, their analogy to animals would, in a manner, suggest itself. From the same seed are produced two different plants; the one barren, the other fertile. The analogy to the sexes of animals immediately presents itself to the mind, and we denominate that which is barren, or bears no seeds, *male*; that which is fertile, or bears seeds, *female*. The same analogy carries us farther, and induces a conjecture, that these male and female plants are connected together in such a manner, that the fecundation of the seeds of the female is operated, as in animals, by the male. This conjecture, furnished by analogy, leads to observations and experiments for its support: and thus the doctrine of the sexes, small and inconsiderable in its beginnings, becomes enlarged, and, from being confined to a very small number of plants, extends itself over the whole vegetable kingdom.

Dr Nehemiah Grew is thought to have first suggested the universality of sexes in plants, and the primary use of the *antheræ apices*, or tops of the stamina, in impregnating the seed. These tops, he observes, are chiefly useful to the plant itself; because all plants, even such as want the foliage or petals, are provided with them: he then plainly asserts, as his opinion, that when the tops, which he calls the *attire*, *break* or *open*, their inclosed *pollen*, or dust, falls down on the seed-bud, the vegetable uterus, and endues it with a prolific virtue; not, as he explains himself, by entering into it bodily, as the *semen masculinum* in animals, but by communicating to it some subtle and vivific effluvia.

This opinion of Grew was adopted by several succeeding botanists, particularly Mr Ray, Camerarius, Geoffroy, Samuel Morland, Dr Blair, Jusieu, Bradley, Van Royen, Malpighi, Vaillant, Ludwig, Wolfius, Logan, Monro, and the justly celebrated Linnæus.

Ray, at first, mentions Grew's doctrine only as probable; but afterwards declares his full assent to it, and collects the arguments that are used to support it.

Rudolphus Jacobus Camerarius, about the end of the last century, endeavoured to demonstrate the analogy betwixt the generation of plants and animals. Among other arguments for the sex of plants, he makes use of the following: "That copulation (says he) is necessary in the generation of animals is past a doubt: that a similar junction obtains in that of plants appears from this circumstance, that if either the tops (*antheræ*) of the male, or the styles of the female, or both,

Sex.

are wanting, no fecundation, and consequently no generation, can take place." This assertion he exemplifies in the mulberry-tree, may, and mercury, in which the stamina of the male flowers being either picked off before they had attained maturity, as in the two first instances, or placed at a distance from the female plant, as in the last, the buds that ought to have produced fruit came not to maturity. The same author speaks of the number of stamina in flowers; so that in his works we may recognize almost the first principles of the celebrated sexual system of Linnæus.

However, almost a century before Grew, Zaluzianski, a native of Poland, had clearly distinguished the sexes of plants, and pointed out the difference betwixt male, female, androgynous, and hermaphrodite plants. Grew's improvements on the idea of Cæsalpinus and Zaluzianski, have made him generally be considered as the author of the doctrine alluded to. Certain it is, that he has handled the subject with great accuracy, and endeavoured, by repeated microscopical examinations, to throw light upon this obscure, but curious inquiry.

Signor Malpighi, who was contemporary with Grew, likewise examined by the microscope the male or fecundating dust, the styles of the feed-bud, and the manner in which the *antheræ* open, or burst, when ripe.

Morland, Geoffroy, and Vaillant, who have written successively upon this subject, all concur in asserting, that the dust of the *antheræ* or tops of the stamina is entirely analogous to the *semen masculinum* of animals, and absolutely necessary for fecundating the feed. Morland, however, differs from Grew, in his conception of the manner in which the fecundation in question is accomplished. The latter, as we have seen, gave it for his opinion, that the fecundating dust did not enter bodily into the ovary of the plant, but operated its effect by means of some spirituous emanations, or vivifying effluvia. Morland, on the other hand, asserted, that "the male-dust is a congeries of seminal plants; one of which must be conveyed through the style into every *ovum* or feed, before it can become prolific." This hypothesis, as the reader will easily perceive, is analogous to that of animal generation, by means of *animalcula* in *femine masculinæ*. Geoffroy, in a memoir presented to the Academy of Sciences at Paris in 1711, on the structure and use of the principal parts of flowers, asserts, that the germ, or *punctum vite*, is never to be seen in the feed till the *antheræ* have shed their dust; and that if the stamina be cut out before the *antheræ* open, the feed will either not ripen, or be barren if it ripens. This last is Camerarius's great argument repeated.

In 1717, Mr Vaillant made some very ingenious discoveries with respect to the nature of the fecundating dust, and the manner of its explosion. He seems, says an ingenious French author, to have been the first eye-witness of this secret of nature, this admirable sport that passes in the flowers of plants between the organs of different sexes. Vaillant is entirely of Grew's opinion, that it is the volatile spirit of the male dust, not its gross or bodily substance, that enters the feeds of plants; the style, which leads to the

case containing the seeds, being frequently found perfectly solid and impenetrable by that substance.

Lastly, the celebrated Sir Charles Linnæus has completed the doctrine of the sex of plants, by collecting all the arguments in support of it that can possibly be advanced; and by founding upon it a system, in which all vegetables are arranged under particular classes, distinguished by the number and other circumstances of their stamina or male organs. See BOTANY, *passim*.

SEXAGENARY, something relating to the number sixty: thus sexagenary or sexagesimal arithmetic, is a method of computation proceeding by sixties; such is that used in the division of a degree into sixty minutes, of the minute into sixty seconds, of the second into sixty thirds, &c. Also sexagenary tables are tables of proportional parts, showing the product of two sexagenaries that are to be multiplied, or the quotient of the two that are to be divided.

SEXAGESIMA, the second Sunday before Lent, or the next to Shrove-Sunday, so called as being about the 60th day before Easter.

SEXAGESIMALS, or SEXAGESIMAL Fractions, fractions whose denominators proceed in a sexagecuple ratio; that is, a prime, or the first minute, $\frac{1}{60}$; a second = $\frac{1}{3600}$; a third = $\frac{1}{216000}$. Anciently, there were no other than sexagesimals used in astronomy; and they are still retained in many cases, though decimal arithmetic begins to grow in use now in astronomical calculations. In these fractions, which some call *astronomical fractions*, the denominator being always 60, or a multiple thereof, is usually omitted, and the numerator only written down: thus, 4', 59', 32'', 50''', is to be read, 4 degrees, 59 minutes, 32 seconds, 50 thirds, 16 fourths, &c.

SEXTANS, SEXTANT, a sixth part of certain things. The Romans having divided their *as* into 12 ounces or uncia, the sixth part of that, or two ounces, was the sextans.—*Sextans* was also a measure which contained two ounces of liquor, or two cyathi.

SEXTANT, in mathematics, denotes the sixth part of a circle, or an arch comprehending 60 degrees.

The word *sextant* is more particularly used for an astronomical instrument made like a quadrant, excepting that its limb only comprehends 60 degrees. The use and application of the sextant is the same with that of the quadrant. See QUADRANT.

SEXTILE, *sextilis*, the position or aspect of two planets when at 60 degrees distance, or at the distance of two signs from one another. It is marked thus (*). See ASPECT.

SEXTON, a church-officer, whose business is to take care of the vessels, vestments, &c. belonging to the church, and to attend the minister, church-wardens, &c. at church.

SEXTUPLE, in music, denotes a mixed sort of triple, which is beaten in double time.

SEXTUS EMPIRICUS, a famous Pyrrhonian philosopher, lived in the second century, under the reign of Antoninus the Debonair. He was a physician of the sect of the Empirics, and is said to have been one of the preceptors of Antoninus the philosopher. There are still extant his Pyrrhonian Institutions, and a large

Sexagenary

Sextus.

work against the mathematicians, &c. The best edition of Sextus Empiricus is that of Fabricius in Greek and Latin, printed at Leipzig in 1718, folio.

SEXUALISTÆ, among botanical writers, those who have established the classes of plants upon the differences of the sexes and parts of fructification in plants, according to the modern method; as Linnæus, &c.

SEINE, a river of France, which, arising near Dijon in Burgundy, runs north-west through Champagne and the Isle of France, through Paris, &c. and, crossing Normandy, falls into the British Channel between Havre de Grace and Honfleur.

SFORZA (James), slyed the Great, count de Corignoli, a renowned warrior, was born in 1639. He was the son of a labourer; but by his military talents he ennobled his family, and was the founder of the illustrious house of the Sforzas dukes of Milan. Drowned in passing the river Pescara in pursuit of Alphonso king of Arragon in 1424.

SFORZA (Francis), natural son to the former; an able statesman, and a renowned general. He served under his father against Alphonso king of Arragon; and, though illegitimate, he succeeded to his estate, and to his post in the army, under Jane II. queen of Naples. He afterwards attached himself to René duke of Anjou, her successor. The reputation of his valour engaged the pope, the Venetians, and the Florentines, to appoint him their general in the war against the duke of Milan, though he had married his daughter. The duke dying in 1447, the Milanese chose Sforza to be their general against the Venetians; and, after many signal services performed for them, he turned his arms against them, laid siege to Milan, and obliged them to acknowledge him duke of Milan. The dukedom, by hereditary right, belonged to Charles duke of Orleans; but Louis XI. who hated the duke of Orleans, entered into a treaty with Sforza, and, in 1464, transferred to him all the claims of France to Milan and Genoa; upon which he made himself master of the latter. Died in 1466.

SHAD, in ichthyology, a species of *CLUPEA*.

SHADDOCK, a species of *CITRUS*.

SHADOW, in optics, a privation or diminution of light, by the interposition of an opaque body; or it is a plane where the light is either altogether obstructed, or greatly weakened, by the interposition of some opaque body between it and the luminary.

SHADOW, in painting, an imitation of a real shadow, effected by gradually heightening and darkening the colours of such figures as by their dispositions cannot receive any direct rays from the luminary that is supposed to enlighten the piece.

SHADWELL (Thomas), descended of an ancient family in Staffordshire, was born in 1640, and educated at Caius college, Cambridge. He then was placed in the Middle Temple to study the laws; where having spent some time, he travelled abroad. Upon his return home, he became acquainted with the most celebrated persons of wit in that age. He applied himself chiefly to dramatic writing, in which he had great success; and upon the Revolution was made poet-laureat and historiographer to king William and queen Mary, in the room of Mr Dryden. These employments he enjoyed till his death, which happened

in 1692. Beside his dramatic writings, he composed several other pieces of poetry; the chief of which are his congratulatory poem on the prince of Orange's coming to England; another on queen Mary; his translation of Juvenal's 10th satire, &c. Mr Dryden treats him with great contempt, in his satire called *Mac-Fleckno*. The best judges of that age, however, gave their testimony in favour of his comedies; which have in them fine strokes of humour; the characters are often original, strongly marked, and well sustained. An edition of his works, with some account of his life and writings prefixed, was published in 1720, in 4 vols 8vo.

SILIAFT of a *COLUMN*, in building, is the body thereof between the base and capital; so called from its straightness. See *ARCHITECTURE*.

SHAFT, in mining, is the pit or hollow entrance into the mine.

SHAFTESBURY, a town of Dorsetshire in England, in W. Long. 2. 10. N. Lat. 51. 0. It stands on a high hill, and is built in the form of a bow. It enjoys a serene wholesome air, and has a fine prospect, but has little water. It is a good thoroughfare, is governed by a mayor, and sends two members to parliament. It gives the title of earl to the noble family of Cooper.

SHAFTESBURY (earl of). See *COOPER*.

SHAG, in ornithology, a species of *PELICANUS*.

SHAGREEN, or *CHAGREEN*, in commerce, a kind of grained leather prepared of the skin of a species of *SQUALUS*, much used in covering cases, books, &c.

SHAKE, in singing. See *GRUPPO*.

SHAKESPEARE (William), the great poet of nature, and the glory of the British nation, was descended of a reputable family, at Stratford upon Avon. His father was in the wool-trade, and dealt considerably that way. He had ten children, of whom our immortal poet was the eldest, and was born in April 1564. At a proper age, he was put to the free-school in Stratford, where he acquired the rudiments of grammar-learning. Whether he discovered at this time any extraordinary genius or inclination for literature, is uncertain. His father had no design to make a scholar of him; on the contrary, he took him early from school, and employed him in his own business; but he did not continue long in it under the controul of his father; for at seventeen years of age he married, commenced master of a family, and became the father of children before he was out of his minority. He now settled in business for himself, and had no other thoughts than of pursuing the wool-trade, when, happening to fall into acquaintance with some persons who followed the practice of deer-stealing, he was prevailed upon to engage with them in robbing Sir Thomas Lucy's park, near Stratford. The injury being repeated more than once, that gentleman was provoked to enter a prosecution against the delinquents; and Shakespeare, in revenge, made him the subject of a ballad, which, tradition says, (for the piece is lost), was pointed with so much bitterness, that it became unsafe for the author to stay any longer in the country. To escape the law, he fled to London. There, destitute of friends and money, he approached the play-house, and, for present support, engaged

Shake
Shakefpe

Shakespeare engaged in the servile employment of holding the horſes of thoſe who rode to the theatre: but converſing accidentally with ſome of the players, he at length gained admittance into the houſe, in the capacity of an inferior actor; nor did his performance entitle him to advancement, ſo that the higheſt character he ever played was that of the Ghoſt in his own Hamlet. The part of an under-actor neither engaged nor deſerved his attention. It was far from filling, or being adequate to the powers of his mind; and therefore he turned the advantage which that ſituation afforded him to a higher and nobler uſe. Having, by practice and obſervation, acquainted himſelf with the mechanical oeconomy of the theatre, his native genius ſupplied the reſt: But the whole view of his firſt attempts in ſtage-poetry being to procure a ſubſiſtence, he directed his endeavours ſolely to hit the taſte and humour that then prevailed among the meaner ſort of people, of whom the audience was generally compoſed; and therefore his images of life were drawn from thoſe of that rank. Thus did Shakespeare ſet out, without the advantage of education, the advice or aſſiſtance of the learned, the patronage of the better ſort, or any acquaintance among them. But when his performances had merited the protection of his prince, and the encouragement of the court had ſucceeded to that of the town, the works of his riper years were manifeſtly raiſed above the level of his former productions.

In this way of writing he was an abſolute original, and of ſuch a peculiar caſt, as hath perpetually raiſed and confounded the emulation of his ſucceſſors; a compound of ſuch very ſingular blemiſhes, as well as beauties, that theſe latter have not more mocked the toil of every aſpiring undertaker to emulate them, than the former, as flaws intimately united to diamonds, have baffled every attempt of the ableſt artiſts to take them out without ſpoiling the whole. Queen Elizabeth, who ſhewed Shakespeare many marks of her favour, was ſo much pleaſed with the delightful character of Sir John Falſtaff, in the two parts of Henry the Fourth, that ſhe commanded the author to continue it for one play more, and to ſhow the knight in love; which he executed inimitably, in the Merry Wives of Windſor.

Among his other patrons, the earl of Southampton is particularly honoured by him, in the dedication of two poems, Venus and Adonis, and Lucrece; in the latter eſpecially, he expreſſes himſelf in ſuch terms as gives countenance to what is related of that patron's diſtinguiſhed generoſity to him. In the beginning of king James I.'s reign (if not ſooner) he was one of the principal managers of the play-houſe, and continued in it ſeveral years afterwards; till, having acquired ſuch a fortune as ſatiſfied his moderate wiſhes and views in life, he quitted the ſtage, and all other buſineſs, and paſſed the remainder of his time in an honourable eſe, at his native town of Stratford, where he lived in a handſome houſe of his own purchaſing, to which he gave the name of *New Place*; and he had the good fortune to ſave it from the flames in the dreadful fire that conſumed the greateſt part of the town in 1614.

In the beginning of the year 1616, he made his will, wherein he teſtified his reſpect to his quondam

partners in the theatre: he appointed his youngeſt daughter, jointly with her husband, his executors, and bequeathed to them the beſt part of his eſtate, which they came into the poſſeſſion of not long after. He died on the 23d of April following, being the 53d year of his age; and was interred among his anceſtors on the north ſide of the chancel, in the great church of Stratford, where there is a handſome monument erected for him, inſcribed with the following elegiac diſtich in Latin.

*Judicio Pylium, genio Socratem, arte Maronem,
Terra tegit, Populus marcet, Olympus habet.*

In the year 1740, another very noble one was raiſed to his memory, at the public expence, in Weſtmiſter-abbey; an ample contribution for this purpoſe being made upon exhibiting his tragedy of Julius Cæſar, at the theatre-royal in Drury-Lane, April 28th 1738.

Nor muſt we omit mentioning another teſtimony of the veneration paid to his manes by the public in general, which is, that a mulberry-tree, planted upon his eſtate by the hands of this reverend bard, was cut down not many years ago; and the wood being converted to ſeveral domeſtic uſes, was all eagerly bought at a high price, and each ſingle piece treaſured up by its purchaſer as a precious memorial of the planter. The late commemorative jubilee, celebrated at his birth-place by the moſt illuſtrious perſons in the nation, is freſh in every one's memory.

The learned editors of the works of this immortal bard have exerted their utmoſt power in praiſe of his extenſive genius and univerſal knowledge of human nature. If, indeed, there ever exiſted an inſpired writer, (if by inſpiration we mean originality), Shakespeare was indubitably inſpired. "His characters," ſays Mr Pope, "are ſo much nature's ſelf, that it were injurious to call them by ſo diſtant a name as *copies*." It is aſtoniſhing, when we conſider the infinite variety of his characters, that a poet, who from his education had ſo little opportunity of acquiring a knowledge of mankind, ſhould, as it were by intuition, have delineated the whole world with ſuch accuracy and truth! But to an Engliſh reader it is ſufficient, independent of his judgment, to appeal to his feelings. Some foreigners have fooliſhly attempted to ridicule particular ſcenes, and to condemn his inattention to their rules of the drama; but ſuch criticisms ſerve only to expoſe their total ignorance of his capacity, his deſign, his invention. He deſpised their rules as he would have deſpised their criticisms. Some of his plays are intentionally neither tragedies nor comedies, but a natural mixture of both: others are profeſſedly hiſtorical: but they are always juſt representations of human nature, call them by what name you will. They ſay Shakespeare was illiterate. The ſuppoſition implies more than panegyric with a hundred tongues could have expreſſed. If he was unlearned, he was the only inſtance of a human being to whom learning was unneceſſary; the favourite child of Nature, produced and educated entirely by herſelf; but ſo educated, that the pedant Art had nothing new to add.

The following is a liſt of his works. 1. The tempeſt, a comedy. 2. The two gentlemen of Verona, C. 3. Henry IV. hiſtorical play, 2 parts. 4. Merry wives of Windſor, C. 5. Meaſure for meaſure, C. 6. The comedy of errors. 7. Much ado about nothing, C.

8. Love's

Shakespeare 8. Love's labour lost, C. 9. The midsummer night's dream, C. 10. The merchant of Venice, C. 11. As you like it, C. 12. The taming of the shrew, C. 13. All's well that ends well, C. Taken from the ninth novel of day iii. of Boccace's Decameron. 14. The twelfth night, or What you will. 15. The winter's tale, tragi-com. The plot from Robert Green's novel of Dorastus and Faunus. 16. King John, tragedy. 17. King Richard II. T. 18. King Henry V. historical play. 19. King Henry VI. historical play, in three parts. 20. King Richard III. T. 21. King Henry VIII. T. 22. Troilus and Cressida, T. From Chaucer. 23. Coriolanus, T. 24. Romeo and Juliet, T. 25. Timon of Athens, T. The story is in Lucian's dialogues, Plutarch's Life of Anthony, &c. 26. Julius Cæsar, T. 27. Macbeth, T. 28. Hamlet prince of Denmark, T. 29. King Lear, T. The story originally from Geoffrey of Monmouth, but immediately from an old ballad. Vide Johnson's Shakespeare, vol. vi. 30. Othello the Moor of Venice, T. The story from Cinthio's novels. 31. Anthony and Cleopatra, T. 32. Cymbeline, T. The plot partly from Boccace's Decameron, day ii. nov. 9. 33. Titus Andronicus, T. This tragedy, being supposed spurious, is rejected by the later editors of Shakespeare. It is however in Theobald's edition.—Eleven of these plays only were printed during Shakespeare's life, and those not corrected by himself, nor published under his inspection.

The several editions of Shakespeare's plays are, by Hemmings and Condell, Lond. 1623, 1632, 1663, 1685.—Nic. Rowe, 1714, 8vo, 9 vol.—Alex. Pope, 1721, 1725, 4to.—Mr Theobald, 1733, 8vo. 1740, 1757, 1762, 1773, 12mo.—Sir Tho. Hanmer, Oxf. 1744, 4to, 6 vol. 1745, 1749, 1771, 8vo.—Mr Warburton, Lond. 1747, 8vo, 8 vol.—Dr Johnson, 1765, 1768, 8vo. 8 vol.—G. Stevens, 20 plays, 1766, 4 vol. 8vo.—Mr Capel, 1768, 8vo. 10 vol.—Johnson and Stevens, 1773, 10 vol. 8vo.

Besides his dramatic works, Shakespeare is said to have written several poems, which are published in a single 8vo volume. His sonnets were published in 1609, 4to.

SHAKLES, in a ship, are the rings with which the ports are shut fast, by lashing the port-bar to them. There are also shakles put upon bilbow-bolts, for confining the men who have deserved corporal punishment.

SHALLOP, a sort of large boat with two masts, and usually rigged like a schooner. See **SCHOONER**.

SHAMBLES, among miners, a sort of niches or landing-places, left at such distances in the adits of the mines, that the shovel-men may conveniently throw up the ore from shamble to shamble, till it comes to the top of the mine.

SHAMMY, or **CHAMOIS-LEATHER**, a kind of leather, either dressed in oil or tanned; and much esteemed for its softness, pliancy, and being capable of bearing soap without hurt.—The true shammy is prepared of the skin of the chamois-goat, a species of **CAPRA**.

SHANK, in the manege, that part of a horse's fore-leg which lies between the knee and the fetlock.

SHANKER, or **CHANCER**, in medicine, a malignant ulcer, usually occasioned by some venereal disorder. See **MEDICINE**, n° 447.

SHANNON, a river of Ireland, and the largest in that island. It rises in the county of Leitrim, running from north to south, and divides the provinces of Leinster and Connaught; it then turns south-west, runs through the province of Munster, passes by the city of Limerick, and falls into the western ocean between the counties of Clare and Limerick.

SHARE of a **PLOUGH**, that part which cuts the ground; the extremity forwards being covered with a sharp-pointed iron, called the *point of the share*; and the end of the wood behind, the *tail of the share*.

SHARK, in ichthyology. See **SQUALUS**.

SHARP, in music. See **INTERVAL**.

SHARP (Dr John), archbishop of York, was descended from the Sharps of Little Norton, a family of Bradford Dale in Yorkshire; and was son of an eminent tradesman of Bradford, where he was born in 1644. He was educated at Cambridge, and in 1667 entered into orders. That same year he became domestic chaplain to Sir Heneage Finch, then attorney-general. In 1672, he was collated to the archdeaconry of Berkshire. In 1675, he was installed a prebendary in the cathedral church of Norwich; and the year following, was instituted into the rectory of St Bartholomew near the Royal Exchange, London. In 1681, he was, by the interest of his patron Sir Heneage Finch, then lord high chancellor of England, made dean of Norwich; but in 1686 was suspended, for taking occasion, in some of his sermons, to vindicate the doctrine of the church of England in opposition to Popery. In 1688, he was sworn chaplain to king James II. being then probably restored after his suspension; for it is certain that he was chaplain to king Charles II. and attended as a court-chaplain at the coronation of king James II. In 1689, he was declared dean of Canterbury; but never could be persuaded to fill up any of the vacancies made by the deprived bishops. Upon the death of Dr Lamplugh, he was promoted to the see of York. In 1702 he preached the sermon at the coronation of queen Anne; and the same year was sworn of the privy-council, and made lord almoner to her majesty. He died at Bath in 1713; and was interred in the cathedral of York, where a monument is erected to his memory.—His sermons, which were collected after his death and published in 7 vols 8vo, are justly admired.

SHASTER, or **SHASTRAM**, a sacred book, containing the religion of the Banians; it consists of three tracts; the first of which contains the moral law, the second the ceremonial, and the third delivers the peculiar observances for each tribe of Indians.—The shaster is looked upon by some as a commentary on the vedam, and by others as an original work, an extract of which has been lately published in England, and has thrown some light upon the subject. This book teaches, that the Eternal Being, absorbed in the contemplation of his own essence, formed the resolution of created beings who might partake of his glory. He spoke, and angels rose into existence; they sang in concert the praises of their Creator, and harmony reigned in the celestial regions; when two of these spirits having revolted, drew a legion after them. The Supreme Being drove them into a place of torment, from whence they were released at the intercession of the faithful angels, upon conditions which at once inspired them with joy and

Shannon
Shafter.

Shaw and terror. The rebels were sentenced, under different forms, to undergo punishments in the lowest of the 15 planets, in proportion to the enormity of their first offence; accordingly each angel underwent 87 transmigrations upon earth, before he animated the body of a cow, which holds the highest rank among the animal-tribes. These different transmigrations are considered as so many stages of expiation, preparatory to a state of probation, which commences as soon as the angel transmigrates from the body of the cow into a human body: in this situation the Creator enlarges his intellectual faculties, and constitutes him a free agent; and his good or bad conduct hastens or retards the time of his pardon. The good are at their death re-united to the Supreme Being, and the wicked begin anew the era of their expiation.

SHAW (Dr Thomas), known to the learned world by his travels to Barbary and the Levant, was born at Kendal in Westmoreland, about the year 1692. He was appointed chaplain to the English consul at Algiers, in which station he continued for several years; and from thence took proper opportunities of travelling into different parts. He returned in 1733; was elected fellow of the royal society; and published the account of his travels at Oxford, folio, 1738. In 1740 he was nominated principal of St Edmund-hall, which he raised from a ruinous state by his munificence; and was regius professor of Greek at Oxford until his death, which happened in 1751. Dr Clayton, bishop of Clogher, having attacked these travels in his "Description of the East," Dr Shaw published a supplement by way of vindication, which is incorporated into the second edition of his travels, prepared by himself, and published in 4to, 1757.

SHEATHING, in the sea-language, is the casing that part of a ship which is to be under water with fir-board of an inch thick; first laying hair and tar, mixed together, under the boards, and then nailing them on, in order to prevent worms from eating the ship's bottom.—Ships of war are now generally sheathed with copper.

SHEATS, in a ship, are ropes bent to the clews of the sails; serving in the lower sails to haul aft the clews of the sail; but in top sails they serve to haul home the clew of the sail close to the yard-arm.

SHEEP, in zoology. See Ovis.

SHEEP *Nose-Worms*, in natural history, a species of fly-worm found in the noses of sheep, goats, and stags, and produced there from the egg of a large two-winged fly.

The frontal sinuses above the nose in sheep and other animals, are the places where these worms live, and attain their full growth. These sinuses are always full of a soft white matter, which furnishes these worms with a proper nourishment, and are sufficiently large for their habitation; and when they have here acquired their destined growth, and come to the condition in which they are fit to undergo their changes for the fly-state, they leave their old habitation, and falling to the earth, bury themselves there; and when these are hatched into flies, the female, when she has been impregnated by the male, knows that the nose of a sheep, or other animal, is the only place to deposit her eggs in order to their coming to good.

Mr Vallinieri, to whom the world owes so many dif-

coveries in the insect-class, is the first who has given any true account of the origin of these worms. Tho' their true history had been till that time unknown, the creatures themselves were very early discovered, and many ages since were esteemed great medicines in epilepsies.

It is very common to find only one worm in the head of the creature that has them, often two are found, and sometimes three, but very seldom any more than that.

Redi has given a very imperfect figure of this creature, nor is that of Mr Vallinieri much better. The worm has two brown hooks at the anterior part of its head, placed parallel, or nearly parallel, to one another. It is composed of 11 rings, which together form a conic figure, something flattened, of which the head of the worm is the point. When the worm is young, it is very white; but has two brown spots placed over-against each other, in the hinder part of its body, which are its two posterior stigmata. Each of these spots is parted into two by a concentric circle, which is sensible, as it is whitish, the rest of the spot being brown. It is plainly this very separation which gives passage to the air. When the creature pleases, it shows these; but it can also draw them into a sort of purse in its posterior ring. The anus is just below, and is usually hid by the folds of the skin. The hooks are brown and strong; just above these are two little fleshy horns, and between them is placed the mouth.

This worm, when at its full growth, is considerably large, and becomes brownish, or of a dirty white. Its belly, examined by the microscope, is seen furnished with a number of fine short prickles between the rings: the points of all these are turned backward, and one may even feel these prickles, in drawing the finger along the belly from the hinder part toward the head.

These worms are capable of moving themselves very swiftly; and it is doubtless owing to their motions in the head of the creature, and to the pain that the sensible membranes there must have from being wounded by the hooks and prickles of this animal, that sheep are often seen to grow outrageous, and strike their heads against trees and other hard bodies.

When these worms are taken out of the heads of sheep, if they are put upon the earth, they immediately bury themselves very deeply in it; and if not yet at their full growth, or in a proper state for their changes, they die there: but if it be near the time that they would naturally have quitted their ancient habitation, which may be known by their being changed from their fine white to a brownish colour, then they undergo all their proper changes under a shell made by the hardening of their own skin. This shell is of the same shape with the animal itself, but is of a deep brown.

It takes some time for the creature to undergo its several changes, and that more or less according to the season. Mr Vallinieri had one produced in the perfect fly-state, after 40 days from the time of its first change. Mr Reaumur found those which formed their shell on the 24th of April, not to produce the fly before the 27th of June.

The creature, when ready to appear in the fly-state, has no great difficulty in the getting out of its case; the swelling and inflating its head, and throwing out
its.

its bladder, which is the practice of these creatures on this occasion, easily detaches a piece of the shell, originally loose, and gives the fly a sufficient passage.

The fly produced from this worm has all the time of its life a very lazy disposition, and does not like to make any use either of its legs or wings. Its head and corcelet together are about as long as its body, which is composed of five rings, streaked on the back; a pale yellow and brown are there disposed in irregular spots: the belly is of the same colour; but they are there more regularly disposed, for the brown here makes three lines, one in the middle, and one on each side, and all the intermediate spaces are yellow. The wings are nearly of the same length with the body, and are a little inclined in their position, so as to lie upon the body; they do not, however, cover it, but a naked space is left between them. The ailerons, or petty wings, which are found under each of the wings, are of a whitish colour, and perfectly cover the balancers, so that they are not to be seen without lifting up these. The upper part of the corcelet is full of small black prominences, which, when examined by the microscope, appear as so many corns of gunpowder. Its head is large in proportion to the size of the body, and its reticular eyes are of a deep changeable green. These eyes take up less space in the head than those of most other flies: they leave a considerable space between them; and in that are placed the three smaller or glossy eyes, which are placed in form of a small triangle, and stand so near as to touch one another. The rest of the upper part of the head is yellowish, and, viewed by the microscope, appears cavernous like a sponge, or morel; and in the bottom of each of these small cavities is a little black prominence. There are other two hollows in the anterior part of the head, in which the antennæ are placed; these are of the battledoor form, but rather round than flat, and have each a large hair going from them. The under part of the head, which is rounder than the upper, is whitish, and very smooth; it has two sorts of bands directed downward, which are the elongations of the rims of the arches where the antennæ are lodged. The smoothness of the under part of the head makes one see very distinctly these three little tubercles; the upper one brown, the under ones of a pale deadish yellow. The mouth of the fly seems to be placed between these, immediately under the upper tubercle.

The fly will live two months after it is first produced from the shell, but will take no nourishment of any kind; and possibly it may be of the same nature with the butterflies, which never take any food during the whole time of their living in that state.

SHEEP-Stealing. See **THEFT**.

Composition for Marking SHEEP. For this purpose Dr Lewis recommends tallow mixed with a certain proportion of tar, and the mixture thickened by powder of charcoal. The proportions he tried were an eighth, a sixth, and a fourth part of tar. None of these could be discharged by any washing or rubbing with water, but all of them completely by soap; that which had the smallest proportion, easily enough; the others more difficultly.

SHEERING, in the sea-language. When a ship is not steered steadily, they say she sheers, or goes sheering; or when, at anchor, she goes in and out by means of the current of the tide, they also say she sheers.

SHEERNESS, a fort in Kent, seated on the point where the river Medway falls into the Thames. It was built by king Charles II. after the insult of the Dutch, who burnt the men of war at Chatham. The buildings belonging to it, in which the officers lodge, make a pretty little neat town; and there is also a yard and a dock, a chapel and a chaplain. Mr Lyons, who failed with the Hon. Captain Phipps in his voyage towards the pole, fixed the longitude of Sheerness to $0^{\circ} 31' E$. its latitude $51^{\circ} 31' 30'' N$.

SHEERS, in a ship, are two masts set across at the upper end of each other; a contrivance generally used for setting or taking out the masts of a ship, where there is no hulk to do that office.

SHEFFIELD, a town in the West Riding of Yorkshire, with a market on Tuesdays, and two fairs, on Tuesday after Trinity-Sunday and November 28, for cattle and horses. It is seated on the river Don, or Dune; and had a strong castle, which was demolished in the late civil wars. It is a large place, whose houses are built of stone, and has been long noted for edge-tools, knives, and swords; for Chaucer, in one of his tales, takes notice of a man with a Sheffield whittle by his side. It is now a place where there is the most considerable manufactures for hardware in England, next to Birmingham. W. Long. 1. 20. N. Lat. 53. 23.

SHEFFIELD (John) duke of Buckinghamshire, one of the finest writers of the last and present century, of great personal bravery, and an able minister of state, was born about 1646. He lost his father at nine years of age; and his mother marrying with lord Osfulton, the care of his education was left entirely to a governor, who did not greatly improve him in his studies. Finding that he was deficient in many parts of literature, he resolved to devote a certain number of hours every day to his studies; and thereby improved himself to the degree of learning he afterwards attained. Though possessed of a good estate, he did not abandon himself to pleasure and indolence, but offered to go a volunteer in the second Dutch war; and accordingly was in that famous naval engagement where the duke of York commanded as admiral: on which occasion his lordship behaved so gallantly, that he was appointed commander of the Royal Catherine. He afterward made a campaign in the French service, under M. de Turenne. As Tangier was in danger of being taken by the Moors, he offered to lead the forces which were sent to defend it; and accordingly was appointed commander of them. He was then earl of Mulgrave, and one of the lords of the bed-chamber to king Charles II. The Moors retired on the approach of his majesty's forces; and the result of the expedition was the blowing up of Tangier. He continued in several great posts during the short reign of king James II. till that unfortunate prince was de-throned. Lord Mulgrave, though he paid his respects to king William before he was advanced to the throne, yet he did not accept of any post in the government till some years after. In the sixth year of William and Mary, he was created marquis of Normanby in the county of Lincoln. He was one of the most active and zealous opposers of the bill which took away Sir John Fenwick's life; and exerted the utmost vigour in carrying through those two admirable bills, the Treason Bill, and that for Triennial Parliaments. He

Sheffield,
Sheik.

He enjoyed some considerable posts under king William, and was generally pretty well in his favour and confidence. In 1702, he was sworn lord privy-seal; and in the same year was appointed one of the commissioners to treat of an union between England and Scotland. In 1703, he was created duke of Normandy, and soon after duke of Buckinghamshire. In 1711, he was made steward of her majesty's household, and president of the council. During queen Anne's reign he was but once out of employment; and then he resigned it himself, being attached to what were called the *Tory principles*. Her majesty offered to make him lord chancellor; which post he refused. He was instrumental in the change of the ministry in 1710. A circumstance that reflects the highest honour on him is, the vigour with which he acted in favour of the unhappy Catalans, who afterward were so inhumanly sacrificed. He was survived by only one legitimate son, (who died at Rome in 1735); but left several natural children. His worst enemies allowed him to have lived always very kindly with his last wife, natural daughter to king James II. the late duchess of Buckingham, a lady who always behaved with a dignity suitable to her high birth and quality. He died in 1721, aged 75 years; and his works speak him one of the most beautiful prose-writers and greatest poets of this age, which is also proved by the testimonies of the finest writers his contemporaries. His writings were splendidly printed in 1723, in two volumes 4to; and have since been reprinted in 1729, in two vols 8vo. The first contains his poems on various subjects: the second, his prose works; which consist of historical memoirs, speeches in parliament, characters, dialogues, critical observations, essays, and letters. It may be proper to observe, that the edition of 1729 is castrated; some particulars relating to the revolution in that of 1723 having given offence.

SHEIK, in the oriental customs, the person who has the care of the mosques in Egypt; his duty is the same as that of the imams at Constantinople. There are more or fewer of these to every mosque, according to its size or revenue. One of these is head over the rest, and answers to a parish-priest with us; and has under him, in large mosques, the readers, and people who cry out to go to prayers; but in small mosques the sheik is obliged to do all this himself. In such it is their business to open the mosque, to cry to prayers, and to begin their short devotions at the head of the congregation, who stand rank and file in great order, and make all their motions together. Every Friday the sheik makes an harangue to his congregation.

SHEIK-BELLET, the name of an officer in the Oriental nations. In Egypt the sheik-bellet is the head of a city, and is appointed by the pacha. The business of this officer is to take care that no innovations be made which may be prejudicial to the Porte, and that they send no orders which may hurt the liberties of the people. But all his authority depends on his credit and interest, not his office: for the government of Egypt is of such a kind, that often the people of the least power by their posts have the greatest influence; and a caia of the janizaries or Arabs, and sometimes one of their meanest officers, an oda-basha, finds means, by his parts and abilities, to govern all things.

Vol. X.

I

Shells
Shell.

SHELLS, or **SHEALS**, South and North, two seaport towns, one in the county of Durham, and the other in Northumberland; neither has market nor fair, but both are remarkable for being the mart where ships take in their loading of coals, and where they make large quantities of salt. They are seated on each side of the mouth of the river Tyne, 10 miles east of Newcastle, and 188 north by west of London. W. Long. 1. 0. N. Lat. 55. 0.

SHEKEL, in Jewish antiquity, an ancient coin worth 2 s. 3½ d. Sterling.

SHELF, among miners, the same with what they otherwise call *fast ground* or *fast country*; being that part of the internal structure of the earth which they find lying even and in an orderly manner, and evidently having retained its primitive form and situation.

SHELL, in natural history, a hard, and, as it were, stony covering, with which certain animals are defended, and thence called *shell-fish*.

The singular regularity, beauty, and delicacy, in the structure of the shells of animals, and the variety and brilliancy in the colouring of many of them, at the same time that they strike the attention of the most incurious observers, have at all times excited philosophers to inquire into and detect, if possible, the causes and manner of their formation. But the attempts of naturalists, ancient and modern, to discover this process, have constantly proved unsuccessful. M. de Reaumur hitherto appears alone to have given a plausible account, at least, of the formation of the shell of the garden-snail in particular, founded on a course of very ingenious experiments, related in the Paris Memoirs*. He there endeavours to show, that this substance is produced merely by the perspirable matter of the animal, condensing and afterwards hardening on its surface, and accordingly taking the figure of its body, which has performed the office of a mould to it; in short, that the shell of a snail, and, as he supposed, of all other animals possessed of shells, was only the product of a viscous transudation from the body of the animal, containing earthy particles united by mere juxtaposition. This hypothesis, however, is liable to very great and insurmountable difficulties, if we apply it to the formation of some of the most common shells: for how, according to this system, it may be asked, can the oyster, for instance, considered simply as a mould, form to itself a covering so much exceeding its own body in dimensions?

M. Herissant, in the memoirs of the academy of sciences for 1766, has discovered the structure of shells to be organical. In the numerous experiments that he made on an immense number, and a very great variety, of animal-shells, he constantly found that they were composed of two distinct substances; one of which is a cretaceous or earthy matter; and the other appeared, from many experiments made upon it, by burning, distillation, and otherwise, to be evidently of an animal-nature. These two substances he dextrously separated from each other by a very easy chemical analysis; by the gentle operation of which they were exhibited distinctly to view, without any material alteration from the action of the solvent, or instrument, employed for that purpose. On an entire shell, or a fragment of one, contained in a glass vessel, he

poured

Shells. poured a sufficient quantity of the nitrous acid, considerably diluted either with water or spirit of wine. After the liquor has dissolved all the earthy part of the shell, (which may be collected, after precipitation by a fixed or volatile alkali), there remains floating in it a soft substance, consisting of innumerable membranes of a retiform appearance, and disposed, in different shells, in a variety of positions, which constitutes the animal-part of it. This, as it has not been affected by the solvent, retains the exact figure of the shell; and, on being viewed through a microscope, exhibits satisfactory proofs of a vascular and organical structure. He shows that this membranous substance is an appendix to the body of the animal, or a continuation of the tendinous fibres that compose the ligaments by which it is fixed to its shell; and that this last owes its hardness to the earthy particles conveyed through the vessels of the animal, which fix themselves into, and incrust, as it were, the meshes formed by the reticular filaments of which this membranous substance is composed. In the shell called *porcelaine*, in particular, the delicacy of these membranes was so great, that he was obliged to put it into spirit of wine, to which he had the patience to add a single drop of spirit of nitre day by day, for the space of two months; left the air generated, or let loose by the action of the acid on the earthy substance, should tear the compages of its fine membranous structure into shatters; as it certainly would have done, in a more hasty and less gentle dissolution. The delicate reticulated film, left after this operation, had all the tenuity of a spider's web; and accordingly he does not attempt to delineate its organisation. In other shells, he employed even five or six months in demonstrating the complicated membranous structure of this animal-substance by this kind of chemical anatomy. In general, however, the process does not require much time.

Of the many singular configurations and appearances of the membranous part of different shells, which are described in this memoir, and are delineated in several well executed plates, we shall mention only, as a specimen, the curious membranous structure observed in the laminæ of mother-of-pearl, and other shells of the same kind, after having been exposed to the operation of the author's solvent. Beside the great variety of fixed or permanent colours with which he found the animal-filaments of these shells to be adorned, it is known that the shell itself presents to the view a succession of rich and changeable colours, the production of which he easily explains from the configurations of their membranes. Nature, he observes, always magnificent in her designs, but singularly frugal in the execution of them, produces these brilliant decorations at a very small expence. The membranous substance above-mentioned is plaited and rumpled, as it were, in such a manner, that its exterior laminæ, incruited with their earthy and semi-transparent matter, form an infinite number of little prisms, placed in all kinds of directions, which refract the rays of light, and produce all the changes of colour observable in these shells.

Fossil Shells. Those found buried at great depths in the earth.

Of these some are found remaining almost entirely in their native state, but others are variously altered by

being impregnated with particles of stone and of other fossils; in the place of others there is found mere stone or spar, or some other native mineral-body, expressing all their lineaments in the greatest nicety, as having been formed wholly from them, the shell having been first deposited in some solid matrix, and thence dissolved by very slow degrees, and this matter left in its place, on the cavities of stone and other solid substances, out of which shells had been dissolved and washed away, being afterwards filled up less slowly with these different substances, whether spar or whatever else: these substances, so filling the cavities, can necessarily be of no other form than that of the shell, to the absence of which the cavity was owing, though all the nicer lineaments may not be so exactly expressed. Besides these, we have also in many places masses of stone formed within various shells; and these having been received into the cavities of the shells while they were perfectly fluid, and having therefore nicely filled all their cavities, must retain the perfect figures of the internal part of the shell, when the shell itself should be worn away or perished from their outside. The various species we find of these are, in many genera, as numerous as the known recent ones; and as we have in our own island not only the shells of our own shores, but those of many other very distant ones, so we have also many species, and those in great numbers, which are in their recent state, the inhabitants of other yet unknown or unsearched seas and shores. The cockles, muscles, oysters, and the other common bivalves of our own seas, are very abundant: but we have also an amazing number of the nautilus kind, particularly of the nautilus græcorum, which though a shell not found living in our own or any neighbouring seas, yet is found buried in all our clay-pits about London and elsewhere; and the most frequent of all fossil shells, in some of our counties, are the conchæ anomæ, which yet we know not of in any part of the world in their recent state. Of this sort also are the cornua ammonis and the gryphitæ, with several of the echinitæ and others.

The exact similitude of the known shells, recent and fossil, in their several kinds, will by no means suffer us to believe, that these, though not yet known to us in their living state, are, as some have idly thought, a sort of *lusus nature*. It is certain, that of the many known shores, very few, not even those of our own island, have been yet carefully searched for the shell-fish that inhabit them; and as we see in the nautilus græcorum an instance of shells being brought from very distant parts of the world to be buried here, we cannot wonder that yet unknown shores, or the unknown bottoms of deep seas, should have furnished us with many unknown shell-fish, which may have been brought with the rest; whether that were at the time of the general deluge, or the effect of any other catastrophe of a like kind, or by whatever other means, to be left in the yet unhardened matter of our stony and clayey strata.

Shells, in gunnery, are hollow iron balls to throw out of mortars or howitzers, with a fuse-hole of about an inch diameter, to load them with powder, and to receive the fuse. The bottom, or part opposite to the fuse, is made thicker than the rest, that the fuse may fall uppermost. But in small elevations this does not always happen, nor indeed is it necessary; for, let the shell

Shell
|
Shenstone.

Sheppy,
Sheriff.

shell fall as it will, the fuse sets fire to the powder within, which bursts the shell, and causes great devastation. The shells had much better be of an equal thickness; for then they burst into more pieces.

Message-SHELLS, are nothing more than howitz-shells, in the inside of which a letter or other papers are put: the fuse-hole is stopped up with wood or cork, and the shells are fired out of a royal or howitz, either into a garrison or camp. It is supposed, that the person to whom the letter is sent knows the time, and accordingly appoints a guard to look out for its arrival.

SHELL-FISH. These animals are in general oviparous, very few instances having been found of such as are viviparous. Among the oviparous kinds, anatomists have found that some species are of different sexes in the different individuals of the same species; but others are hermaphrodites, every one being in itself both male and female. In both cases their increase is very numerous, and scarce inferior to that of plants, or of the most fruitful of the insect-class. The eggs are very small, and are hung together in a sort of clusters by means of a glutinous humour, which is always placed about them, and is of the nature of the jelly of frog's spawn. By means of this, they are not only kept together in the parcel, but the whole cluster is fastened to the rocks, shells, or other solid substances; and thus they are preserved from being driven on shore by the waves and left where they cannot succeed.

SHELL-GOLD. See *SHELL GOLD*.

SHELTIE, a small, but strong kind of horse, so called from Shetland, or Zetland, where they are produced.

SHENAN. See *Dying of LEATHER*, (p. 4161. foot-note.)

SHENSTONE (William), an admired English poet, was the eldest son of a plain country gentleman who farmed his own estate in Shropshire. The father, sensible of his son's capacity, placed him in Pembroke college, Oxford; but he could never persuade him to enter into orders. In his private opinions, our author adhered to no particular sect, and hated all religious disputes. Tenders, in every sense of the word, was his peculiar characteristic; and his friends, domestics, and poor neighbours, daily experienced the effects of his benevolence. This virtue he carried to an excess that seemed to border upon weakness; yet if any of his friends treated him ungenerously, he was not easily reconciled. On such occasions, however, he used to say, "I never will be a revengeful enemy; but I cannot, it is not in my nature, be half a friend." He was no economist; for the generosity of his temper prevented his paying a proper regard to the use of money: he exceeded therefore the bounds of his paternal fortune. But, if we consider the perfect paradise into which he had converted his estate, the hospitality with which he lived, his charities to the indigent, and all out of an estate that did not exceed 300 l. a-year, one should rather wonder that he left any thing behind him, than blame his want of economy: he yet left more than sufficient to pay all his debts; and, by his will, appropriated his whole estate for that purpose. Though he had a high opinion of many among the fair sex, he forbore to marry. A passion he entertained

in his youth was with difficulty surmounted. The lady was the subject of that admirable pastoral, in four parts, which has been so universally and so justly admired, and which, one would have thought, must have softened the proudest and most obdurate heart. His works have been published by Mr Doddsley, in 3 vols 8vo. The first volume contains his poetical works, which are particularly distinguished by an amiable elegance and beautiful simplicity; the second volume contains his prose works; the third his letters, &c.

SHEPPEY, an island at the mouth of the river Medway, about 20 miles in circumference. It is separated from the main land by a narrow channel; and has a fertile soil, which feeds great flocks of sheep. The borough-town of Queenborough is seated thereon; besides which it has several villages.

SHERIFF, an officer, in each county in England, nominated by the king, invested with a judicial and ministerial power, and who takes place of every nobleman in the county during the time of his office.

The sheriff is an officer of very great antiquity in this kingdom, his name being derived from two Saxon words, signifying the *reeve*, *bailiff*, or *officer* of the shire. He is called in Latin *vice-comes*, as being the deputy of the earl or *comes*, to whom the custody of the shire is said to have been committed at the first division of this kingdom into counties. But the earls, in process of time, by reason of their high employments and attendance on the king's person, not being able to transact the business of the county, were delivered of that burden; reserving to themselves the honour, but the labour was laid on the sheriff. So that now the sheriff does all the king's business in the county; and tho' he be still called *vice-comes*, yet he is entirely independent of, and not subject to, the earl; the king, by his letters-patent, committing *custodiam comitatus* to the sheriff, and him alone.

Sheriffs were formerly chosen by the inhabitants of the several counties. In confirmation of which it was ordained by statute 28 Edw. I. c. 8. that the people should have election of sheriffs in every shire where the shrievalty is not of inheritance. For anciently in some counties the sheriffs were hereditary; as we apprehend they were in Scotland till the statute 20 Geo. II. c. 23; and still continue in the county of Westmorland to this day: the city of London having also the inheritance of the shrievalty of Middlesex vested in their body by charter. The reason of these popular elections is assigned in the same statute, c. 13. "that the commons might choose such as would not be a burden to them." and herein appears plainly a strong trace of the democratical part of our constitution; in which form of government it is an indispensable requisite, that the people should choose their own magistrates. This election was in all probability not absolutely vested in the commons, but required the royal approbation. For in the Gothic constitution, the judges of their county-courts (which office is executed by the sheriff) were elected by the people, but confirmed by the king; and the form of their election was thus managed; the people, or *incole territorii*, chose twelve electors, and they nominated three persons, *ex quibus rex unum confirmabat*. But, with us in England, these popular elections, growing tumultuous, were put an end to by the

Sheriff.

statute 9 Edw. II. ft. 2. which enacted, that the sheriffs should from thenceforth be assigned by the chancellor, treasurer, and the judges; as being persons in whom the same trust might with confidence be reposed. By statutes 14 Edw. III. c. 7. 23 Hen. VI. c. 8. and 21 Hen. VIII. c. 20. the chancellor, treasurer, president of the king's council, chief justices, and chief baron, are to make this election; and that on the morrow of All Souls, in the exchequer. And the king's letters-patent, appointing the new sheriffs, used commonly to bear date the sixth day of November. The statute of Cambridge, 12 Ric. II. c. 2. ordains, that the chancellor, treasurer, keeper of the privy seal, steward of the king's house, the king's chamberlain, clerk of the rolls, the justices of the one bench and the other, barons of the exchequer, and all other that shall be called to ordain, name, or make justices of the peace, sheriffs, and other officers of the king, shall be sworn to act indifferently, and to name no man that sueth to be put in office, but such only as they shall judge to be the best and most sufficient. And the custom now is, (and has been at least ever since the time of Fortescue, who was chief justice and chancellor to Henry the sixth), that all the judges, together with the other great officers, meet in the exchequer chamber on the morrow of All Souls yearly, (which day is now altered to the morrow of St Martin by the last act for abbreviating Michaelmas term), and then and there propose three persons to the king, who afterwards appoints one of them to be sheriff. This custom, of the twelve judges proposing three persons, seems borrowed from the Gothic constitution before-mentioned; with this difference, that among the Goths the 12 nominors were first elected by the people themselves. And this usage of ours, at its first introduction, there is reason to believe, was founded upon some statute, tho' not now to be found among our printed laws: first, because it is materially different from the direction of all the statutes beforementioned; which it is hard to conceive that the judges would have countenanced by their concurrence, or that Fortescue would have inserted in his book, unless by the authority of some statute: and also, because a statute is expressly referred to in the record, which Sir Edward Coke tells us he transcribed from the council-book of 3d March, 34 Hen. VI. and which is in substance as follows. The king had of his own authority appointed a man sheriff of Lincolnshire, which office he refused to take upon him: whereupon the opinions of the judges were taken, what should be done in this behalf. And the two chief justices, Sir John Fortescue and Sir John Priot, delivered the unanimous opinion of them all; "that the king did an error when he made a person sheriff, that was not chosen and presented to him according to the statute; that the person refusing was liable to no fine for disobedience, as if he had been one of the three persons chosen according to the tenor of the statute; that they would advise the king to have recourse to the three persons that were chosen according to the statute, or that some other thrifty man be intreated to occupy the office for this year; and that, the next year, to eschew such inconveniences, the order of the statute in this behalf made be observed." But, notwithstanding this unanimous resolution of all the judges of England, thus entered in the council-book, and the

Blackst.
Comment.

statute 34 & 35 Hen. VIII. c. 26. § 61. which expressly recognizes this to be the law of the land, some of our writers have affirmed, that the king, by his prerogative, may name whom he pleases to be sheriff, whether chosen by the judges or no. This is grounded on a very particular case in the fifth year of queen Elizabeth, when, by reason of the plague, there was no Michaelmas term kept at Westminster; so that the judges could not meet there in *crasino animarum* to nominate the sheriffs: whereupon the queen named them herself, without such previous assembly, appointing for the most part one of two remaining in the last year's list. And this case, thus circumstanced, is the only authority in our books for the making these extraordinary sheriffs. It is true, the reporter adds, that it was held that the queen by her prerogative might make a sheriff without the election of the judges, *non obstante aliquo statuto in contrarium*: but the doctrine of *non obstante*'s, which sets the prerogative above the laws, was effectually demolished by the bill of rights at the revolution, and abdicated Westminster-hall when king James abdicated the kingdom. However, it must be acknowledged, that the practice of occasionally naming what are called *packet-sheriffs*, by the sole authority of the crown, hath uniformly continued to the reign of his present majesty; in which, it is believed, (if any) instances have occurred.

Sheriffs, by virtue of several old statutes, are to continue in their office no longer than one year; and yet it hath been said that a sheriff may be appointed *durante bene placito*, or during the king's pleasure; and so is the form of the royal writ. Therefore, till a new sheriff be named, his office cannot be determined, unless by his own death, or the demise of the king; in which last case it was usual for the successor to send a new writ to the old sheriff: but now, by statute 1 Ann. ft. 1. c. 8. all officers appointed by the preceding king may hold their offices for six months after the king's demise, unless sooner displaced by the successor. We may farther observe, that by statute 1 Ric. II. c. 11. no man that has served the office of sheriff for one year, can be compelled to serve the same again within three years after.

We shall find it is of the utmost importance to have the sheriff appointed according to law, when we consider his power and duty. These are either as a judge, as the keeper of the king's peace, as a ministerial officer of the superior courts of justice, or as the king's bailiff.

In his judicial capacity he is to hear and determine all causes of 40 shillings value and under, in his county-court; and he has also a judicial power in divers other civil cases. He is likewise to decide the elections of knights of the shire, (subject to the control of the House of Commons), of coroners, and of verderors; to judge of the qualification of voters, and to return such as he shall determine to be duly elected.

As the keepers of the king's peace, both by common law and special commission, he is the first man in the county, and superior in rank to any nobleman therein, during his office. He may apprehend, and commit to prison, all persons who break the peace, or attempt to break it; and may bind any one in a recognizance to keep the king's peace. He may, and

Sheriff.

Sheriff. is bound *ex officio*, to pursue and take all traitors, murderers, felons, and other misdoers, and commit them to gaol for safe custody. He is also to defend his county against any of the king's enemies when they come into the land: and for this purpose, as well as for keeping the peace and pursuing felons, he may command all the people of his county to attend him; which is called the *posse comitatus*, or power of the county: which summons, every person above 15 years old, and under the degree of a peer, is bound to attend upon warning, under pain of fine and imprisonment. But though the sheriff is thus the principal conservator of the peace in his county, yet, by the express directions of the great charter, he, together with the constable, coroner, and certain other officers of the king, are forbidden to hold any pleas of the crown, or, in other words, to try any criminal offence. For it would be highly unbecoming, that the executioners of justice should be also the judges; should impose, as well as levy, fines and amercements; should one day condemn a man to death, and personally execute him the next. Neither may he act as an ordinary justice of the peace during the time of his office: for this would be equally inconsistent, he being in many respects the servant of the justices.

In his ministerial capacity, the sheriff is bound to execute all process issuing from the king's courts of justice. In the commencement of civil causes, he is to serve the writ, to arrest, and to take bail; when the cause comes to trial, he must summon and return the jury; when it is determined, he must see the judgment of the court carried into execution. In criminal matters, he also arrests and imprisons, he returns the jury, he has the custody of the delinquent, and he executes the sentence of the court, though it extend to death itself.

As the king's bailiff, it is his business to preserve the rights of the king within his bailiwick; for so his county is frequently called in the writs: a word introduced by the princes of the Norman line; in imitation of the French, whose territory is divided into bailiwicks, as that of England into counties. He must seize to the king's use all lands devolved to the crown by attainder or escheat; must levy all fines and forfeitures, must seize and keep all waifs, wrecks, estrays, and the like, unless they be granted to some subject; and must also collect the king's rents within his bailiwick, if commanded by process from the exchequer.

To execute these various offices, the sheriff has under him many inferior officers; an under-sheriff, bailiffs, and gaolers, who must neither buy, sell, nor farm their offices, on forfeiture of 500 l.

The under-sheriff usually performs all the duties of the office; a very few only excepted, where the personal presence of the high-sheriff is necessary. But no under-sheriff shall abide in his office above one year; and if he does, by statute 23 Hen. VI. c. 8. he forfeits 200 l. a very large penalty in those early days. And no under-sheriff or sheriff's officer shall practise as an attorney during the time he contigues in such office: for this would be a great inlet to partiality and oppression. But these salutary regulations are shamefully evaded, by practising in the names of other attorneys, and putting in sham deputies by way of nominal under-sheriffs: by reason of which, says Dalton, the under-sheriffs and bailiffs do grow so cunning

in their several places, that they are able to deceive, and it may well be feared that many of them do deceive, both the king, the high-sheriff, and the county.

SHERIFF, in Scotland. See LAW, N^o clviii. 1, 2, 3.
SHERLOCK (William), a learned English divine in the 17th century, was born in 1641, and educated at Eaton school, where he distinguished himself by the vigour of his genius and his application to study. Thence he was removed to Cambridge, where he took his degrees. In 1669, he became rector of the parish of St George, Botolph-lane, in London; and in 1681 was collated to the prebend of Pancras, in the cathedral of St Paul's. He was likewise chosen master of the Temple, and had the rectory of Thersfield in Hertfordshire. After the revolution he was suspended from his preferment, for refusing the oaths to king William and queen Mary; but at last he took them, and publicly justified what he had done. In 1691, he was installed dean of St Paul's. His Vindication of the Doctrine of the Trinity, engaged him in a warm controversy with Dr South and others. Bishop Burnet tells us, he was "a clear, a polite, and a strong writer; but apt to assume too much to himself, and to treat his adversaries with contempt." He died in 1707. His works are very numerous; among these are, 1. A Discourse concerning the Knowledge of Jesus Christ, against Dr Owen. 2. Several pieces against the Papists, the Socinians, and Dissenters. 3. A practical Treatise on Death, which is much admired. 4. A practical Discourse on Providence. 5. A practical Discourse on the future Judgment; and many other works.

SHERLOCK (Dr Thomas), bishop of London, was the son of the preceding Dr William Sherlock, and was born in 1678. He was educated in Catharine-hall, Cambridge, where he took his degrees, and of which he became master: he was made master of the Temple very young, on the resignation of his father; and it is remarkable, that this mastership was held by father and son successively for more than 70 years. He was at the head of the opposition against Dr Hoadley bishop of Bangor; during which contest he published a great number of pieces. He attacked the famous Collins's "Grounds and reasons of the Christian religion," in a course of six sermons preached at the Temple-church, which he intitled "The use and intent of Prophecy in the several ages of the world." In 1728, Dr Sherlock was promoted to the bishopric of Bangor; and was translated to Salisbury in 1734. In 1747, he refused the archbishopric of Canterbury, on account of his ill state of health; but recovering in a good degree, accepted the see of London the following year. On occasion of the earthquakes in 1750, he published an excellent Pastoral Letter to the clergy and inhabitants of London and Westminster: of which it is said there were printed in 4to, 5000; in 8vo, 20,000; and in 12mo, about 30,000; beside pirated editions, of which not less than 50,000 were supposed to have been sold. Under the weak state of body in which he lay for several years, he revised and published 4 volumes of Sermons in 8vo, which are particularly admired for their ingenuity and elegance. He died in 1762, and by report worth 150,000 l. "His learning," says Dr Nicholls, "was very extensive: God had given him a great and an understanding mind, a quick comprehension, and a solid judgment. These advan-

Sherlock.

Shetland.

advantages of nature he improved by much industry and application. His skill in the civil and canon law was very considerable; to which he had added such a knowledge of the common law of England, as few clergymen attain to. This it was that gave him that influence in all causes where the church was concerned; as knowing precisely what it had to claim from its constitutions and canons, and what from the common law of the land." Dr Nicholls then mentions his constant and exemplary piety, his warm and fervent zeal in preaching the duties and maintaining the doctrines of Christianity, and his large and diffusive munificence and charity; particularly by his having given large sums of money to the corporation of clergymen's sons, to several of the hospitals, and to the society for propagating the gospel in foreign parts: also his bequeathing to Catharine-hall in Cambridge, the place of his education, his valuable library of books, and his donations for the founding a librarian's place and a scholarship, to the amount of several thousand pounds.

SHETLAND, the name of certain islands belonging to Scotland, and lying to the northward of Orkney. There are many convincing proofs that these islands were very early inhabited by the Picts, or rather by those nations who were the original possessors of the Orkneys; and at the time of the total destruction of these nations, if any credit be due to tradition, their woods were entirely ruined (A). It is highly probable that the people in Shetland as well as in the Orkneys, flourished under their own princes dependent upon the crown of Norway; yet this seems to have been rather through what they acquired by fishing and commerce, than by the cultivation of their lands. It may also be reasonably presumed, that they grew thinner of inhabitants after they were annexed to the crown of Scotland; and it is likely that they revived again, chiefly by the very great and extensive improvements which the Dutch made in the herring-fishery upon their coasts, and the trade that the crews of their buxses, then very numerous, carried on with the inhabitants, necessarily resulting from their want of provisions and other conveniences, which in those days could not be very considerable.

There are many reasons which may be assigned why these islands, though part of our dominions, have not hitherto been better known to us. They were commonly placed two degrees too far to the north in all the old maps, in order to make them agree with Ptolemy's description of Thule, which he asserted to be in the latitude of 63 degrees; which we find urged by Camden as a reason why Thule must be one of the Shetland isles, to which Speed also agrees, though from their being thus wrong placed he could not find room for them in his maps. Another, and that no light cause, was the many false, fabulous, and impertinent relations published concerning them (B), as if they were countries inhospitable and uninhabitable; and lastly, the indolence, or rather indifference, of the natives, who,

Shetland.

contenting themselves with those necessities and conveniences procured by their intercourse with other nations, and conceiving themselves neglected by the mother country, have seldom troubled her with their applications.

There are few countries that have gone by more names than these islands; they were called *islandic*, *Hialtlandia*, from *hialt*, the "hilt of a sword;" this might be possibly corrupted into *Hetland*, *Hiltland*, or *Hethland*, though some tell us this signifies a "high land." They have been likewise, and are still in some maps, called *Zetland* and *Zealand*, in reference, as has been supposed, to their situation. By the Danes, and by the natives, they are styled *Yealtaland*; and notwithstanding the oddness of the orthography, this differs very little, if at all, from their manner of pronouncing Zetland, out of which pronunciation grew the modern names of *Shetland* and *Shotland*.

The islands of *Shetland*, as we commonly call them, are well situated for trade. The nearest continent to them is Norway; the port of Bergen lying 44 leagues east, whereas they lie 46 leagues north north-east from Buchanells; east north-east from Sanda, one of the Orkneys, about 16 or 18 leagues; six or seven leagues north-east from Fair Isle; 58 leagues east from the Ferroe isles; and at nearly the same distance north-east from Lewis. The southern promontory of the main land, called *Swinburgh Head*, lies in 50 degrees and 59 minutes of north latitude; and the northern extremity of Uist, the most remote of them all, in the latitude of 61 degrees 15 minutes. The meridian of London passes through this last island, which lies in the longitude of 2 degrees 30 minutes west from Paris, and about 5 degrees 15 minutes east from the meridian of Cape Lizard. According to the old accounts, from which there seems no just reason to vary, there are in all 46 inhabited islands of different sizes, 40 holms, and 30 skerries. It is impossible to speak with precision; but, according to the best computation we have been able to form, the Shetland isles contain near three times as much land as the Orkneys: they are considered also, in this light, equal in size to the island of Madeira; and not inferior to the provinces of Utrecht, Zealand, and all the rest of the Dutch islands taken together.

The principal of the Shetland islands is styled *Main Land*; which extends in length from north to south about 60 miles, and is in some places above 20 broad, in others not more than 2. It is however every where so intersected by arms of the sea, that there is not a single spot therein that is full three English miles from salt-water. The whole coast, a very few places excepted, is a high, rough, inaccessible rock; and within land, the country is mountainous, mossy, and full of morasses. Here and there, however, but more especially towards the coast, there are little parcels of land that are both smooth and fertile. Among the numerous inlets of the sea that pierce both sides of the island, some of which enter several miles, and in the language of the country are styled *vovers*, there are a great many ports, not fewer than

(A) The tradition is, that this was done by the Scots when they destroyed the Picts; but is more probably referred to the Norwegians rooting out the original possessors of Shetland.

(B) They represented the climate as intensely cold; the soil as composed of crags and quagmire, so barren as to be incapable of bearing corn; to supply which, the people, after drying fish-bones, powdered them, then kneaded and baked them for bread. The larger fish-bones were said to be all the fuel they had. Yet, in so dreary a country, and in such miserable circumstances, they were acknowledged to be very long-lived, cheerful, and contented.

Shetland. than 20 that may be with justice styled *barbours*; and amongst these are six, three on each side of the island, that are remarkably good. On the west side is Scalloway Voe, which flows into the land through several inlets of various sizes, by which there are two entrances that lead to the harbour, which is deep, safe, and commodious. The town of Scalloway before which it lies, was formerly the chief, indeed the only one in the island. A. D. 1600, Patrick earl of Orkney built a stately castle here, which is now in ruins; and the place in a course of years has so much declined, that there are scarce 30 houses. On the same side of the island are Olis Voe and Valley Sound, both fine ports and very capacious. On the other side of the island, that is, on the east, the town of Lerwick, which is the present capital, is situated, which consists of upwards of 400 houses, and is every day increasing. Opposite to this town lies the island of Bressay or Brassa, and between the island and the main runs the famous Brassa, sometimes also called *Broad*, Sound, in which no less than 2000 sail of vessels have lain at once safe and commodiously. It is four miles in length; in some places two, in others one mile broad, in some others much narrower; but deep and well secured from winds. There is towards the north end a rock called the *Unicorn* (c). On the same side of the island with Bressa Sound, are Dura Voe and Balta, both good ports; and also Catford Voe, where in the summer season a whole navy may ride with great convenience. There are few or no sands or shoals upon the coast, except one on the west side called *Hæve de Grind*, and some dangerous rocks to the north-west.

On the west side of the main land there are not fewer than 20 islands of very different sizes, besides holms and skerries: neither are either of these unprofitable, as the former afford vast quantities of fine grass for the feeding of cattle; on the coasts of the latter are caught abundance of fine fish of different sorts; and on both there are immense quantities of fowl. To the south of Scalloway lies the little island of St Ninian, corruptly called *St Ringing's*, in which, though but a mile long and half a mile broad, there is a large well-built church, which shews that it was once fully inhabited. Opposite to the town of Scalloway lie several islands, which, as we have before observed, break the rapidity of the flood, and form safe entrances into the harbour. The biggest of these isles is Trondra; three miles long and two broad. Burra consists of two islands, one called *Houfe*, the other *Kirk Island*; in neither which, it is said, mice can live. To the north of these lies Papa Stour, or the Great Papa; which, though but two miles long and one broad, is esteemed the pleasantest, and, for its size, the best furnished with the necessaries of life of any of these isles. There are

besides this, Pappas, and the little Papa; and to the north of these, Rou Stour, or the Great Rou, eight miles long and two broad, with a good port.

There are also many islands on the east side of the main land; some of which it may not be improper to mention. To the south of Lerwick lies Mousa or the Queen's island, one mile in length, and about a quarter of a mile broad, and is remarkable for having upon it the most complete and entire of those little fortifications called by the natives *brugh*s, but by the Scots commonly *Pià's Houses*, that are still remaining in any of these islands (d). Over-against Lerwick lies Bressay or Brassa isle, five miles from south to north, and two from west to east. This isle for its size is very mountainous, and amongst many hills there are two in it very conspicuous. One of these is on the east side, called *Andrew's Hill*; the other, which is the highest, at the south end, called the *Wart* or *Beacon Hill*. It is in a manner over-run with heath, though there are some considerable parcels of good pasturage and arable lands near the shore. There are also eight fresh-water lochs, abounding with fine trout and eels. It must have been very populous in former times, since there are the ruins of five small forts, and there are still two churches and a chapel. It has likewise a good port called *Aiths Voe*. At a small distance to the east lies another isle, called the *Noss*, two miles long and three quarters of a mile broad: it has a church upon it, is equally fertile and pleasant; and has a large holm belonging to it, in which there are abundance of sea-fowls. Whalley, that is, the isle of whales, which lies to the north of Bressay, and to the east of the main land, is about nine miles in circumference. At six leagues distance from this isle lie the Skerries, on which, in 1664, the Carmalan of Amsterdam, a very rich East India ship, was lost. To the north of Whalley there are many small islands, most of which are inhabited; and though but insignificant at present, yet, if any change of fortune should happen to the Shetland isles, they would probably partake of it, and by being turned to useful purposes, and, in consequence of that, retaining all the posterity of their present inhabitants, come to be thought of more consequence.

But besides these, there are two large and considerable islands belonging to Shetland, with several small ones in their vicinity. The first of these is Yell, which anciently was written *Zeal*, making however, as we have before remarked, no great alteration in the pronunciation. This island, in the opinion of the learned Mr Maule, from its nearness to Norway, seems to have been the first inhabited, and to have given name to all the rest. His opinion has certainly a great degree of probability; for the natives call themselves, and are called

(c) When James Hepburn duke of Orkney fled hither, he was pursued by William Kirkcaldie of Grange, in a ship called the *Unicorn*, which striking thereon, left its name to this rock. This gave the duke an opportunity of escaping, who, after lying many years in prison in Denmark, perished at last miserably in that confinement.

(d) We have an exact description of this *brugh* in Latin, by the learned Mr Maule, of the noble family of Panmure, one of the ablest antiquarians his country ever produced. These *brugh*s in their form are not unlike pigeon-houses: they have a winding stair in the wall of each, which reaches quite to the top. These served as watch-towers and beacons, having heaps of peat on the top, which were kindled to give notice of an enemy's appearance; and therefore all the *brugh*s in an island were in sight one of another. There were cells or apartments underneath for securing their persons or effects; and in some of them subterraneous passages to some creek, wherein their boats lay, in which they might escape. Whoever attentively considers the motives which induced these people to raise such structures, how well calculated they were to answer the ends for which they were built, and for how many ages they have resisted the rage of time, will hesitate at calling those who constructed them barbarians.

Shetland.

called by all the northern nations, *Talts*, and their language *Taltmoll*. Now in the Islandic, which was the original language of Norway, *joll* signifies a "dark cloud;" and consequently *jelland*, or *jellland*, a "rainy country," which it may be presumed is at least as good an etymology as any that has been hitherto offered. Mr Maule likewise thinks that this was the true Thule. This island lies north-east-by-east from Mainland, and is divided from it by an arm of the sea called *Yell Sound*. In the old descriptions, Yell is said to be 20 miles long and 8 broad. It is very mountainous, and full of moss: but there are pretty considerable pastures, in which they feed a great many sheep; and it also affords plenty of peat. It has eight large voes or harbours, besides many smaller bays, which would not be thought despicable anchoring-places in other countries. It seems to have been populous in ancient times, since there are in it 3 churches, 20 chapels, and many brughs or Pictish forts. There are dependent upon it Hascolea, two miles long and one broad, Samphra, and Bigga; all of them islands very fertile in grass. Besides these, to the south-west lies Fetlar, or Theodore's isle, nine or ten miles in compass, with a church, ten chapels, and many brughs; it has several creeks for small boats, but nothing that can be called a port.

The other of these two larger islands is Unst, which is also the most northern of all the Shetland isles, and at the same time the pleasantest, and not the least fertile amongst them. It lies at a small distance east from Yell, having that large island between it and the main land, being divided from the first mentioned island by an arm of the sea called *Blumel Sound*. Unst is eight miles long, and between three and four broad, and divided into 24 fættalds, 22 of which have each of them a proportion of sea-coast. There is great plenty of heather and peat, with some good pasture and a little of very fertile arable ground. Near the middle of this isle there is a loch three miles in extent, in which there are abundance of trout, eel, and flounders. Here are three churches, 24 chapels, and 11 brughs. There was also a castle at the southern extremity, called *Mowmer*, now in decay. There are two excellent harbours, the one in the south called *Via Bay*, being covered by an island of the same name, equally commodious and capacious, having nine fathom water, and good anchoring ground. The other is on the east side, covered by the isle of Balta, and from thence called *Balta Voe*, very safe and spacious, with eight fathom water. There are besides these, bays and roads less considerable. The number of inhabitants in these islands, that is Unst and its dependencies, may be about 1500, and they have 70 fishing-boats. Via is a very fair island, and produces great plenty of fine and rich grass. The same may be said of Balta, which is also well stocked with rabbits. There are besides these islets four or five holms, which feed sheep and cattle; and the island of Linga, low, flat, covered with moss, but which would be a very convenient place for salt-pans, if the inhabitants were in such a condition as to be capable of carrying on a fishery entirely on their own account.

Between six and seven leagues west from the main land lies the island of Fula or Foula, commonly called by our seamen *Foul Island*, in opposition to that of which

Shetland.

we shall speak. It is about three miles long, narrow, and full of rough, steep, and bare rocks, one of which is so large, and runs up to so great a height, as to be clearly seen from the Orkneys. This, therefore, may be esteemed, with the greatest probability, the Thule of Tacitus, whatever might be the Thule of the Phœnicians and Greeks. It has scarce any pasturage, and very little arable land; but that, though small in size, is however very fertile, out of the produce of which, with fowl and fish, the poor inhabitants subsist. They have nothing that can be called a port; and the only commodities they have, are stock-fish, train-oil, and feathers.

The Fair Isle lies between Orkney and Shetland, 10 or 12 leagues east-north-east from the former; seven, or, as others say, 10 leagues south-west from the latter; and about 18 or 19 leagues south-east from Foula. It is full three miles long, and scarce half a mile broad, very craggy, with three high rocks, which are clearly seen both from Orkney and Shetland. There is in this island also a small quantity of arable land, which is very fruitful and well-manured; they might have considerably more, but they are obliged to reserve this for peat and pasturage. They have, for the size of the island, a great many sheep, and those are very good and very fat; but they have no kind of mair-fowl or other game, but very great plenty of sea and water-fowl, and all kinds of fish upon their coasts. They have a very pretty church, but no minister, being annexed to one of the parishes of Shetland, or served by an itinerant minister, as some late accounts assert. A layman reads the Scriptures every Sunday in the church, the inhabitants being a very religious, harmless, sober, and honest people. They have in effect no port, though they have two that are nominally so; one at the south end, which is full of rocks, where only small boats can lie, and that but indifferently; the other at the north-east end, larger and safer in the summer time, so as to serve commodiously enough for their fishery. Small and insignificant as this island may seem, there is a very remarkable piece of history belonging to it. The duke of Medina Sidonia, when commander in chief of the famous Spanish Armada in 1588, was wrecked on the east coast of this island. The ship broke to pieces, but the duke and about 200 more escaped. They lived there till both themselves and the inhabitants were very near famished; at length the duke and the poor remains of his people were carried over to the main land of Shetland by Andrew Humphry. He continued some time at Quendale, and then embarked on board the same small ship, and was safely conveyed therein to Dunkirk; for which service he rewarded Andrew Humphry with 3000 merks. This island produced to its late proprietor between 50 and 60 pound Sterling *per annum*; and was sold at Edinburgh, on the 20th day of June 1766, for the sum of 10,200 pounds Scots, or about 850 pounds Sterling, to James Stuart of Burgh, Esq;

In respect to climate, the Shetland islands have not much to boast, and yet are very far from being such miserable habitations as some have represented them. The longest day in the island of Unst is 19 hours 15 minutes, and of consequence the shortest day 4 hours and 45 minutes. The spring is very late, the summer very short; the autumn also is of no long duration, dark, foggy,

Shetland. foggy, and rainy; the winter sets in about November, and lasts till April, and sometimes till May. They have frequently in that season storms of thunder, much rain, but little frost or snow. High winds are indeed very frequent and very troublesome, yet they seldom produce any terrible effects. The aurora borealis is as common here as in any of the northern countries. In the winter season the sea swells and rages in such a manner, that for five or six months their ports are inaccessible, and of course the people during that space have no correspondence with the rest of the world (A).

The soil in the interior part of the main land, for the most part, is mountainous, moorish, and boggy, yet not to such a degree as to render the country utterly impassable; for many of the roads here, and in some of the northern isles, are as good as any other natural roads, and the people travel them frequently on all occasions. Near the coasts there are sometimes for miles together flat pleasant spots, very fertile both in pasture and corn. The mountains produce large crops of very nutritive grass in the summer; and they cut considerable quantities of hay, with which they feed their cattle in the winter. They might with a little attention bring more of their country into cultivation; but the people are so much addicted to their fishery, and feel so little necessity of having recourse to this method for subsistence, that they are content, how strange soever that may seem to us, to let four parts in five of their land remain in a state of nature.

They want not considerable quantities of marle in different islands, though they use but little; hitherto there has been no chalk found; limestone and freestone there are in the southern parts of the main land in great quantities, and also in the neighbouring islands, particularly Fetlar; and considerable quantities of slate, very good in its kind. No mines have been hitherto wrought, though there are in many places visible appearances of several kinds of metal. Some solid pieces of silver, it is said, have been turned up by the plough. In the island of Via, a yellow metal has been met with, which being found difficult to melt, has been neglected. In some of the smaller isles there are strong appearances of iron; but, through the want of proper experiments being made, there is, in this respect at least, hitherto nothing certain. Their meadows are inclosed with dikes, and produce very good grass. The little corn they grow is chiefly barley, with some oats; and even in the northern extremity of Unst (as we have hinted before) the little land they have is remarkable for its fertility. The hills abound with medicinal herbs; and their kitchen-gardens thrive as well, and produce as good greens and roots, as any in Britain. Of late years, and since this has been attended to, some gentlemen have had even greater success than they expected in the cultivating tulips, roses, and many other flowers. It is true, that tho', as has been before observed, they have no trees, and hardly any shrubs except juniper, yet they have a tradition that their country was formerly overgrown with woods; and it seems to be a confirmation of this, that the roots

of timber-trees have been and are still dug up at a Shetland. great depth; and that in some, and those too inaccessible, places, the rotten tree is still found growing wild. That this defect, viz. the want of wood at present, does not arise entirely from the soil or climate, appears from several late experiments; some gentlemen having raised ash, maple, horse-chestnuts, &c. in their gardens. Though the inhabitants are without either wood or coals, they are very well supplied with fuel, having great plenty of hether and peat. The black cattle in this country are in general of a larger sort than in Orkney, which is owing to their having more extensive pastures; a clear proof that still farther improvements might be made in respect to size. Their horses are small, but strong, stout, and well-shaped, live very hardy, and to a great age. They have likewise a breed of small swine, the flesh of which, when fat, is esteemed very delicious. They have no geats, hares, or foxes; and in general no wild or venomous creatures of any kind, except rats in some few islands. They have no moor-fowl, which is the more remarkable as there are every where immense quantities of hether; but there are many sorts of wild and water fowl, particularly the dunter-geese, clack-geese, solan-geese, swans, ducks, teal, whaps, foils, lyres, kittiwakes, maws, plovers, scarfs, &c. There is likewise the ember-geese, which is said to hatch her egg under her wing. Eagles and hawks, as also ravens, crows, mews, &c. abound here.

All these islands are well watered; for there are every where excellent springs, some of them mineral and medicinal. They have indeed no rivers; but many pleasant rills or rivulets, which they call *burns*, of different sizes; in some of the largest they have admirable trouts, some of which are of 15 and even of 20 pounds weight. They have likewise many fresh-water lakes, well stored with trout and eels, and in most of them there are also large and fine flounders; in some very excellent cod. Their fresh-water lakes, if the country was better peopled, and the common people more at their ease, are certainly capable of great improvements. The sea-coasts of the main land of Shetland, in a straight line, are 55 leagues; and therefore there cannot be a country conceived more proper for establishing an extensive fishery. What the inhabitants have been hitherto able to do, their natural advantages considered, does not deserve that name, notwithstanding they export large quantities of cod, tusk, ling, and hake, inasmuch, that the bounty allowed by acts of parliament amounts from 1400*l.* to 2000*l.* annually. They have, besides, codlins, haddock, whiting, turbot, skate, and a variety of other fish. In many of the inlets there are prodigious quantities of excellent oysters, lobsters, muscles, cockles, and other shell-fish. As to amphibious creatures, they have multitudes of otters and seals; add to these, that amber, ambergris, and other spoils of the ocean, are frequently found upon the coasts.

In respect to the inhabitants, they are a stout, well-made, comely people; the lower sort of a swarthy complexion. The gentry are allowed, by all who have

(E) We must by no means suppose the temper and disposition of the people affected by the dearth of the season. Winter, on the contrary, is a kind of carnival in Shetland. All kinds of people eat flesh and live well during this period of relaxation. Gentlemen of family and fortune, of which there are many here, live so hospitably and so politely, that few strangers regret the length of the winter who happen to spend it amongst them.

convered with them, to be most of them polite, shrewd, sensible, lively, active, and intelligent persons; and these, to the number of 100 families, have very handsome, strong, well-built houses, neatly furnished; their tables well served, polished in their manners, and exceedingly hospitable and civil to strangers. Those of an inferior rank are a hardy, robust, and laborious people, who, generally speaking, get their bread by fishing in all weathers in their yaws, which are little bigger than Graveend wherries; live hardily, and in the summer season mostly on fish; their drink, which, in reference to the British dominions, is peculiar to the country, is called *bland*, and is a sort of butter-milk, long kept, and very four. Many live to great ages, though not so long as in former times. In respect, however, to the bulk of the inhabitants, from the poornefs of living, from the nature of it, and from the drinking great quantities of corn-spirits of the very worst sort, multitudes are afflicted with an inveterate scurvy; from which those in better circumstances are entirely free, and enjoy as good health as in any other country in Europe. As they have no great turn to agriculture, and are persuaded that their country is not fit for it, they do not (tho' probably they might) raise corn enough to subsist them for more than two-thirds of the year. But they are much more successful in their pasture-grounds, which are kept well inclosed, in good order, and, together with their commons, supply them plentifully with beef and mutton. They pay their rents generally in butter at Lammass, and in money at Martinmas. As to manufactures, they make a strong coarse cloth for their own use, as also linen. They make likewise of their own wool very fine stockings. They export salted and dried ling, cod, and tulk, some herrings, a considerable quantity of butter and train oil, otter and seal skins, and no inconsiderable quantity of the fine stockings before-mentioned. Their chief trade is to Leith, London, Hamburgh, Spain, and to the Straights. They import timbers, deals, and some of their best oats, from Norway; corn and flour from the Orkneys, and from North Britain; spirits and some other things from Hamburgh; cloths and better sort of linen from Leith; grocery, household furniture, and other necessaries, from London. The superior-duties to the earl of Morton are generally let in farm; and are paid by the people in butter, oil, and money. The remains of the old Norwegian constitution are still visible in the division of their lands; and they have some udalmen or freeholders amongst them. But the Scots laws, customs, manners, dress, and language, prevail; and they have a sheriff, magistrates for the administration of justice, as well as a custom-house, with a proper number of officers. In reference to their ecclesiastical concerns, they have a presbytery, 12 ministers, and an itinerant for Foula, Fair Island, and the Skerries. Each of these ministers has a stipend of between 40 and 50 pounds, besides a house and a glebe free from taxes. The number of souls in these islands may be about 20,000.

SHEW-BREAD, among the Hebrews, the name given to those loaves of bread which the priests placed every sabbath-day upon the golden table in the sanctuary. The shew-bread consisted of 12 loaves, according to the number of the tribes. These were served up hot

on the sabbath-day; and at the same time the stale ones, which had been exposed all the week, were taken away. It was not lawful for any one to eat of these loaves but the priests only: this offering was accompanied with salt and frankincense, which was burnt upon the table at the time they set on fresh loaves.

SHIELD, an ancient weapon of defence, in the form of a light buckler, borne on the arm, to turn off lances, darts, &c.

SHIELD, in heraldry, the escutcheon or field on which the bearings of coats of arms are placed. See **HERALDRY**.

SHIEL DRAKE, in ornithology. See **ANAS**.

SHILLING, an English silver coin. See **MONEY-Table**.

It is observed that there were no shillings or twopenny pieces in England till the year 1504, when they were first coined by Henry VIII.

SHINGLES, in building, small pieces of wood, or quartered oaken boards, sawn to a certain scantling, or, as is more usual, cleft to about an inch thick at one end, and made like wedges, four or five inches broad, and eight or nine inches long.

Shingles are used instead of tiles or slates, especially for churches and steeples; however, this covering is dear; yet, where tiles are very scarce, and a light covering is required, it is preferable to thatch; and where they are made of good oak, cleft, and not sawed, and well seasoned in water and the sun, they make a sure, light, and durable covering.

The building is first to be covered all over with boards, and the shingles nailed upon them.

SHIP, a general name for all large vessels with sails, fit for navigation on the sea; except galleys, which go with oars, and smack-sails.

To whom the world is indebted for the invention of ships, is, like all other things of equal antiquity, uncertain.

A very small portion of art or contrivance was seen in the first ships: they were neither strong nor durable; but consisted only of a few planks laid together, without beauty or ornament, and just so compacted as to keep out the water. In some places they were only the hulks or stocks of trees hollowed, and then consisted only of one piece of timber. Nor was wood alone applied to this use; but any other buoyant materials, as the Egyptian reed papyrus, or leather, of which the primitive ships were frequently composed; the bottom and sides being extended on a frame of thin battens or scantlings, of flexible wood, or begirt with wickers, such as we have frequently beheld amongst the American savages. In this manner they were often navigated upon the rivers of Ethiopia, Egypt, and Sabæan Arabia, even in latter times. But in the first of them, we find no mention of any thing but leather or hides sewed together. In a vessel of this kind, Dardanus secured his retreat to the country afterwards called *Troy*, when he was compelled by a terrible deluge to forsake his former habitation of Samothrace. According to Virgil, Charon's infernal boat was of the same composition.

But as the other arts extended their influence, naval architecture likewise began to emerge from the gloom of ignorance and barbarism; and as the ships of those

Ship.

ages were increased in bulk, and better proportioned for commerce, the appearance of those floating citadels of unmutual form, full of living men, flying with seemingly expanded wings over the surface of the untravelled ocean, struck the ignorant people with terror and astonishment: and hence, as we are told by Aristophanes, arose the fable of Perseus flying to the Gorgons, who was actually carried thither in a ship! Hence, in all probability, the famous story of Triptolemus riding on a winged dragon is deduced, only because he sailed from Athens, in the time of a great dearth, to a more plentiful country, to supply the necessities of his people. The fiction of the flying horse Pegasus may be joined with these, who, as several mythologists report, was nothing but a ship with sails, and thence said to be the offspring of Neptune the sovereign of the sea; nor does there appear any other foundation for the stories of griffins, or of ships transformed into birds and fishes, which we so often meet with in the ancient poets. So acceptable to the first ages of the world were inventions of this nature, that whoever made any improvements in navigation or naval architecture, building new ships better fitted for strength or swiftness than those used before, or rendered the old more commodious by additional contrivances, or discovered countries unknown to former travellers, were thought worthy of the greatest honours, and often associated into the number of their deified heroes. Hence we have in astronomy the signs of Aries and Taurus, which were no other than two ships: the former transported Phryxus from Greece to Colchos, and the latter Europa from Phœnicia to Crete. Argo, Pegasus, and Perseus's whale, were likewise new ships of a different sort from the former, which being greatly admired by the barbarous and uninstructed people of those times, were translated amongst the stars, in commemoration of their inventors, and metamorphosed into constellations by the poets of their own and of succeeding ages.

The chief parts, of which ships anciently consisted, were three, viz. the belly, the prow, and the stern: these were again composed of other smaller parts, which shall be briefly described in their order. In the description, we chiefly follow Scheffer, who hath so copiously treated this subject, and with such industry and learning collected whatever is necessary to illustrate it, that very little room is left for enlargement by those who incline to pursue this investigation.

1. In the belly, or middle part of the ship, there was *τρωνίς, carina*, or the "keel," which was composed of wood: it was placed at the bottom of the ship, being designed to cut and glide through the waves, and therefore was not broad, but narrow and sharp; whence it may be perceived that not all ships, but only the *μικραί*, which ships of war were called, whose bellies were freight and of a small circumference, were provided with keels, the rest having usually flat bottoms. Around the outside of the keel were fixed pieces of wood, to prevent it from being damaged when the ship was first lanced into the water, or afterwards struck on any rocks; these were called *χλινεumata*, in Latin *cunei*.

Next to the keel was *φαλλίς*, the "pump-well, or well-room," within which was contained the *αὐτήν*, or

"pump;" through which water was conveyed out of the ship.

After this, there was *δευτέρα τρωνίς*, or the "second keel," somewhat resembling what is now called the *kelson*; it was placed beneath the pump, and called *λίσσιον, χαλκινὴ, κλιτοστειδιον*; by some it is falsely supposed to be the same with *φαλλίς*.

Above the pump was an hollow place, called by Herodotus *κοιλὰ τῆς ὕλης*, by Pollux *κύτος* and *ῥακτὰ*, because large and capacious, after the form of a belly; by the Latins, *tefudo*. This was formed by crooked ribs, with which it was surrounded, which were pieces of wood rising from the keel upwards, and called by Hefychius *ῥομίς*, and by others *ἰσουλία*, the belly of the ship being contained within them: in Latin, *costæ*; and in English *timbers*. Upon these were placed certain planks, which Aristophanes calls *εντερωνίς*, or *εντερωνία*.

Hence proceed we to the *παλῦρι, latera*, or "sides" of the ship, which encompassed all the former parts on both hands; these were composed of large rafters extended from prow to stern, and called *ῥακτῆρις*, and *ζωμιαumata*, because by them the whole fabric was begirt or surrounded.

In both these sides the rowers had their places, called *τοίχη* and *ἰσουλία*, in Latin *fori* and *transstra*, placed above one another: the lowest was called *θαλαμῶς*, and those that laboured therein *θαλαμῶν*; the middle *ζυγα*, and the men *ζυγίαι*; the uppermost *θρανίον*, whence the rowers were termed *θρανισταί*. In these apartments were spaces through which the rowers put their oars: these were sometimes one continued vacuity from one end to the other, called *τρεφῆ*; but more usually distinct holes, each of which was designed for a single oar: these were filled *τρικατά*, *τενυσuata*, as also *οὐδαμῶν*, because not unlike the eyes of living creatures. All of them were by a more general name termed *ἰγκυαία*, from containing the oars; but *ἰγκυαία* seems to have been another thing, signifying the spaces between the banks of oars on each side, where the passengers appear to have been placed. On the top of all there was a passage or place to walk, called *παράδοξος*, and *παρεμβάνους*, as joining to the *θρανίον*, or uppermost bank of oars.

2. *Πρωά*, the "prow or fore-deck," whence it is sometimes called *μυταπον*, and commonly distinguished by other metaphorical titles taken from human faces. In some ships there is mention of two prows, as also two sterns; such was Danaus's ship adorned by Minerva when he fled from Egypt. It was usual to beautify the prow with gold and various sorts of paint and colours: in the primitive times red was most in use; whence Homer's ships were commonly dignified with the titles of *μυλτοσuαρεῖς*, and *ροινικοσuαρεῖς*, or "red-faced;" the blue likewise, or sky-colour, was frequently made use of, as bearing a near resemblance to the colour of the sea; whence we find ships called by Homer *κυανοσuαρεῖς*, by Aristophanes *κυανίμβολοι*. Several other colours were also made use of; nor were they barely varnished over with them, but very often annealed by wax melted in the fire, so as neither the sun winds, nor water, were able to deface them. The art of doing this was called from the wax *κυροσuαρία*, from the fire *ἰσταντικὴ*, which is described by Vitruvius, and mentioned in Ovid.

—*Πίστα coloribus efficit
Caruleam matrem coccinea puppis habet.*

The painted ship with milked was annealed
Had Tethys for its delcay

In these colours the various forms of gods, animals, plants, &c. were usually drawn, which were likewise often added as ornaments to other parts of the ships, as plainly appears from the Ancient Monuments presented to the world by Bayfus.

The sides of the prow were termed *πτερά*, or "wings," and *πτερία*, according to Scheffer, or rather *πτερνισ*, for since the prow is commonly compared to a human face, it will naturally follow that the sides should be called *cheeks*; these are now called *bow* by our mariners.

3. *Πρυμνίς*, the "hind-deck or poop," sometimes called *ουρά*, the "tail," because the hindmost part of the ship: it was of a figure more inclining to round than the prow, the extremity of which was sharp, that it might cut the waters; it was also built higher than the prow, and was the place where the pilot sat to steer: the outer-bending part of it was called *ἐπισπίλαιον*, answering to our term, *quarter*.

They had various ornaments of sculpture on the prow; as helmets, animals, triumphal wreaths, &c. The stern was more particularly adorned with wings, shields, &c. Sometimes a little mast was erected whereon to hang ribbands of divers colours, which served instead of a flag to distinguish the ship; and a weather-cock, to signify the part from whence the wind blew.

On the extremity of the prow was placed a round piece of wood, called the *στυλὸς*, from its bending; and sometimes *ὀφθαλμὸς*, the "eye" of the ship, because fixed in the fore-deck; on this was inscribed the name of the ship, which was usually taken from the figure painted on the flag. Hence comes the frequent mention of ships called *Pégassi*, *Scyllæ*, *bulls*, *rams*, *tigers*, &c. which the poets took the liberty to represent as living creatures that transported their riders from one country to another.

The whole fabric being completed, it was fortified with pitch, and sometimes a mixture of rosin, to secure the wood from the waters; whence it comes that Homer's ships are every where mentioned with the epithet of *μυλωναῖα*, or "black." The first that made use of pitch were the inhabitants of Phæacia, since called *Corfica*: sometimes wax was employed in the same use, whence Ovid,

Carulea ceratas accipit unda rates.

The azure waves receive the waxy ships.

After all, the ship being bedecked with garlands and flowers, the mariners also adorned with crowns, she was launched into the sea with loud acclamations and other expressions of joy; and being purified by a priest with a lighted torch, an egg and brimstone, or after some other manner, was consecrated to the god whose image she bore.

The ships of war of the ancients were distinguished from other kinds of vessels, by various turrets and acccessions of building, some to defend their own soldiers, and others to annoy the enemy; and from one another, in latter ages, by several degrees or ranks of oars, the most usual number of which was four or five, which appear not to have been arranged, as some imagine, on the same level in different parts of the ship; nor yet, as others have supposed, directly above

one another's heads; but their seats being placed one behind another, ascended gradually, like stairs. Ptolemy Philopater, urged by a vain-glorious desire of exceeding all the world besides in naval architecture, is said to have farther enlarged the number of banks to 40, and the ship being otherwise in equal proportion, this raised her to such an enormous bulk, that she appeared at a distance like a floating mountain or island; and, upon a nearer view, like a prodigious castle on the ocean. She was 280 cubits long, 38 broad, and 48 high, each cubit being 1 English foot $5\frac{1}{2}$ inches; and carried 400 rowers, 400 sailors, and 3000 soldiers. Another which the same prince made to sail on the Nile, we are told, was half a stadium long. Yet these were nothing in comparison with Hiero's ship, built under the direction of Archimedes; on the structure whereof Moschion wrote a whole volume. There was wood enough employed in it to make 50 galleys: it had all the variety of apartments of a palace; such as banqueting-rooms, galleries, gardens, fish-ponds, stables, mills, baths, and a temple to Venus: it was encompassed with an iron rampart, eight towers, with walls and bulwarks, furnished with machines of war, particularly one which threw a stone of 300 pounds, or a dart 12 cubits long, the space of half a mile, with many other particulars related by Athenæus. But these, and all such monstrous fabrics, served only for show and ostentation; being rendered by their vast bulk unwieldy and unfit for service. Athenæus informs us, the common names they were known by, were *Cyclades*, or *Elna*, i. e. "islands, or mountains," to which they seemed nearly equal in bigness; consisting, as some report, of as many materials as would have composed 50 trimens, or ships of three banks.

A modern ship is undoubtedly the noblest machine that ever was invented; and consists of so many parts, that it would require a whole volume to describe it minutely. However, we shall endeavour to satisfy the reader more fully on this head, as it is an article of the utmost importance.

The plans, elevations, and sections, used in the construction of a ship; the principal pieces of which she is composed; and the qualities requisite to answer the several purposes of navigation, are described, or referred to, in *SHIP-BUILDING*, Part I.; and the application of this theory to practice, is treated in Part II.

The machinery and furniture with which she is equipped, are variously diffused throughout this work. See *MAST*, *SAIL*, *YARD*, *RIGGING*, *ANCHOR*, &c.

The qualities by which she is enabled to encounter a tempestuous sea, are treated in the article *BALLAST* and *TRIM*; and her several movements therein, are explained under *NAVIGATION*, *DRIFT*, *SAILING*, *TACKING*, *LEEWAY*, *PITCHING*, and *ROLLING*.

Considered as a moveable fortress, or citadel, her military operations are described in *NAVAL TACTICS*.

To give a collective illustration of the subject, we have exhibited, in Plate CCLXIII. a representation of a first-rate ship of war, with all her masts, yards, and rigging erect, and the several sails furled to their respective yards and stays; and, in Plate CCLXIV. a section of the same, shewing the inside thereof.

EXPLA.

EXPLANATION of Plate CCLXIII.

Parts of the hull. A, the cat-head; B, the fore-chains; C, the main-chains; D, the mizzen chains; E, the entering port; F, the hawse holes; G, the poop lanterns; H, the ches-tree; I, the head; K, the stern.

L, The bowsprit. 1, 2, Yard and fail. 3, Gammoneing. 4, Horfe. 5, Bob stay. 6, Sprit-fail sheets. 7, Pendants. 8, Braces and pendants. 9, Halliards. 10, Lifts. 11, Clew-lines. 12, Sprit-fail horfes. 13, Bunt-lines. 14, Standing lifts. 15, Sprit-fail top. 16, Flying jib boom. 17, Flying jib stay and fail. 18, Halliards. 19, Sheets. 20, Horfes.

M, The sprit-fail top-mast. 21, Shrouds. 22, 23, Yard and fail. 24, Sheet. 25, Lifts. 26, Braces and pendants. 27, Cap. 28, Jack-staff. 29, Truck. 30, Jack flag.

N, The fore-mast. 31, Runner and tackle. 32, 33, Shrouds. 34, Laniards. 35, Stay and laniard. 36, Preventer-stay and laniard. 37, Woodling the mast. 38, Yard and fail. 39, Horfes. 40, Top. 41, Crow-foot. 42, Jeers. 43, Yard tackles. 44, Lifts. 45, Braces and pendants. 46, Sheets. 47, Fore tackles. 48, Bow-lines and bridles. 49, Fore bunt-lines. 50, Fore lee-line. 51, Fore top rope. 52, Puttock shrouds.

O, The fore top-mast. 53, 54, Shrouds and laniards. 55, Yard and fail. 56, Stay and fail. 57, Runner. 58, Back stays. 59, Halliards. 60, Lifts. 61, Braces and pendants. 62, Horfes. 63, Clew-lines. 64, Bow-lines and bridles. 65, Reef-tackles. 66, Sheets. 67, Bunt-lines. 68, Crofs-trees. 69, Cap.

P, The fore top-gallant mast. 70, 71, Shrouds and laniards. 72, Yard and fail. 73, Back stays. 74, Stay. 75, Lifts. 76, Clew-lines. 77, Braces and pendants. 78, Bow-lines and bridles. 79, Flag staff. 80, Truck. 81, Flag-staff stay. 82, Flag of lord high-admiral.

Q, The main mast. 83, 84, Shrouds. 85, Laniards. 86, Runner and tackle. 87, Pendant of the gornet. 88, Guy of ditto. 89, Sail of ditto. 90, Stay. 91, Preventer-stay. 92, Stay tackle. 93, Woodling the mast. 94, Jeers. 95, Yard tackles. 96, Lifts. 97, Braces and pendants. 98, Horfes. 99, Sheets. 100, Tacks. 101, Bow-lines and bridles. 102, Crow-foot. 103, Top rope. 104, Top. 105, Bunt-lines. 106, Lee-line. 107, Yard and fail.

R, The main top-mast. 108, 109, Shrouds and laniards. 110, Yard and fail. 111, Puttock shrouds. 112, Back-stays. 113, Stay. 114, Stay fail and stay halliards. 115, Runnets. 116, Halliards. 117, Lifts. 118, Clew-lines. 119, Braces and pendants. 120, Horfes. 121, Sheets. 122, Bow-lines and bridles. 123, Bunt-lines. 124, Reef-tackles. 125, Crofs trees. 126, Cap.

S, The main top-gallant mast. 127, 128, Shrouds and laniards. 129, Yard and fail. 130, Back stays. 131, Stay. 132, Stay-fail and halliards. 133, Lifts. 134, Braces and pendants. 135, Bow-lines and bridles. 136, Clew-lines. 137, Flag staff. 138, Truck. 139, Flag-staff stay. 140, Flag standard.

T, The mizen mast. 141, 142, Shrouds and laniards. 143, Pendants and burtons. 144, Yard and

fail. 145, Crow foot. 146, Sheet. 147, Pendant-lines. 148, Peck brails. 149, Stay-fail. 150, Stay. 151, Derric and spann. 152, Top. 153, Crofs jack yard. 154, Crofs jack lifts. 155, Crofs jack braces. 156, Crofs jack slings.

V, The mizen top-mast. 157, 158, Shrouds and laniards. 159, Yard and fail. 160, Back stays. 161, Stay. 162, Halliards. 163, Lifts. 164, Braces and pendants. 165, Bow-lines and bridles. 166, Sheets. 167, Clew-lines. 168, Stay-fail. 169, Crofs trees. 170, Cap. 171, Flag staff. 172, Flag staff stay. 173, Truck. 174, Flag union. 175, Ensign staff. 176, Truck. 177, Ensign. 178, Poop ladder. 179, Bower cable.

Thus have we pointed out the external parts; masts, rigging, &c. an account of all which may be seen under their respective articles Mast, MULL, ROPE, RUDDER, &c.

EXPLANATION of Plate CCLXIV.

Which represents the section of a first-rate man of war, showing its various timbers and apartments.

A is the head; containing, 1, The stem. 2, The knee of the head, or cut water. 3, The lower and upper cheek. 4, The tail-board. 5, The figure. 6, The gratings. 7, The brackets. 8, The false stem. 9, The breast hooks. 10, The haufe hole. 11, The bulk head, forward. 12, The cat-head. 13, The cat-book. 14, Necessary seats. 15, The mauger within board. 16, The bowsprit.

B, Upon the forecable. 17, The gratings. 18, The partners of the fore mast. 19, The gun wale. 20, The belfry. 21, The funnel for the smoke. 22, The gangway going off the forecable. 23, The forecable guns.

C, In the forecable. 24, The door of the bulk head, forward. 25, The officers cabins. 26, The stair-case. 27, The fore top-fail sheet bits. 28, The beams. 29, The car lines.

D, The middle gun-deck, forward. 30, The fore-jeer bits. 31, The oven and furnace of copper. 32, The captain's cook-room. 33, The ladder, or way up into the forecable.

E, The lower gun-deck, forward. 34, The knees fore and aft. 35, The spirketings, or the first streak next to each deck; the next under the beams being called *clamps*. 36, The beams of the middle gun-deck fore and aft. 37, The car-lines of the middle gun-deck, fore and aft. 38, The fore bits. 39, The after, or main bits. 40, The hatchway to the gunner's and boatwain's store-rooms. 41, The jeer capston.

F, The orlop. 42, 43, 44, The gunner's, boatwain's, and carpenter's store-rooms. 45, The beams of the lower gun-deck. 46, 47, The pillars and the riders, fore and aft. 48, The bulk-head of the store-rooms.

G, The hold. 49, 50, 51, The foot-hook rider, the floor-rider, and the standard, fore and aft. 52, The pillars. 53, The step of the fore mast. 54, The kelson, or false keel, and dead rising. 55, The dead wood.

H, A-midships in the hold. 56, The floor timbers. 57, The keel. 58, The well. 59, The chain pump. 60, The step of the main mast. 61, 62, Beams and car-lines of the orlop, fore and aft.

Ship.

Ship.

I, The orlop a-midships. 63, The cable tire. 64, The main hatchway.

K, The lower gun-deck a-midships. 65, The ladder leading up to the middle gun-deck. 66, The lower tire or ports.

L, The middle gun-deck a-midships. 67, The middle tire ports. 68, The entering port. 69, The main jeer bits. 70, Twisted pillars or stantions. 71, The capitan. 72, The gratings. 73, The ladder leading to the upper deck.

M, The upper gun-deck a-midships. 74, The main top-sail sheet bits. 75, The upper partners of the main mast. 76, The gallows on which spare top-masts, &c. are laid. 77, The fore sheet blocks. 78, The runnets. 79, The gun wale. 80, The upper gratings. 81, The drift brackets. 82, The pifs dale. 83, The capitan pall.

N, Aboard the main mast. 84, The gang-way off the quarter-deck. 85, The bulkhead of the coach. 86, The stair-case down to the middle gun-deck. 87, The beams of the upper deck. 88, The gratings about the main-mast. 89, The coach, or council-chamber. 90, The stair-case up to the quarter-deck.

O, The quarter-deck. 91, The beams. 92, The car-lines. 93, The partners of the mizen mast. 94, The gangway up to the poop. 95, The bulk-head of the cuddy.

P, The poop. 96, The trumpeter's cabin. 97, The taffarel.

Q, The captain-lieutenant's cabin.

R, The cuddy, usually divided for the master and secretary's officers.

S, The state-room, out of which is made the bed-chamber, and other conveniences for the commander in chief. 98, The entrance into the gallery. 99, The bulk-head of the great cabin. 100, The stern-lights and after galleries.

T, The ward-room, allotted for the lieutenants and land-officers. 101, The lower gallery. 102, The steerage and bulk-head of the ward-room. 103, The whip-staff, commanding the tiller. 104, The after stair-case down to the lower gun-deck.

V, Several officers cabins aboard the main mast, where the soldiers generally keep guard.

W, The gun-room. 105, The tiller commanding the rudder. 106, The rudder. 107, The stern-post. 108, The tiller-transom. 109, The several transoms, viz. 1, 2, 3, 4, 5. 110, The gun-room ports, or stern-chafe. 111, The bread-room scuttle, out of the gun-room. 112, The main capitan. 113, The pall of the capitan. 114, The partner. 115, The bulk-head of the bread-room.

X, The bread-room. Y, The steward's room, where all provisions are weighed and served out. Z, The cock-pit, where are subdivisions for the purser, the surgeon, and his mates.

AA, The platform, or orlop, where provision is made for the wounded in time of service. 116, The hold aboard the main-mast. 117, The step of the mizen mast. 118, The kelson, or false keel. 119, The dead-wood, or rising.

Different Kinds of Ships. All ships at first were of the same form, whatever uses they were designed for; but the various ends of navigation, some of which were

better answered by one form, some by another, soon gave occasion to build and fit out ships, not only different in bigness, but also in their construction and rigging: and as trade gave occasion to the fitting out large fleets of different kinds of merchant-ships; so ships of war became necessary to preserve them to their just proprietors.

Ships of War, are vessels properly equipped with artillery, ammunition, and all the necessary martial weapons and instruments for attack or defence. They are distinguished from each other by their several ranks or classes. See *RATE*.

Ship of the Line, is usually applied to all men of war mounting 60 guns and upwards. Of late, however, our fifty-gun ships have been formed sufficiently strong to carry the same metal as those of 60; and accordingly may fall into the line in cases of necessity. See *NAVAL TACTICS*, Sect. II.

Armed Ship. See *ARMED SHIP*.

Hospital Ship, a vessel fitted up to attend on a fleet of men of war, and receive their sick or wounded; for which purpose her decks should be high, and her ports sufficiently large. Her cables ought also to run upon the upper deck, to the end that the beds or cradles may be more commodiously placed between decks, and admit a free passage of the air, to disperse that which is offensive or corrupted.

Merchant Ship, a vessel employed in commerce, to carry commodities of various sorts from one port to another.

Merchant ships are estimated by their burden; that is, by the number of tons they bear, each ton reckoned at 2000 lb. weight; this estimate being made by gauging the hold, which is the proper place of loading.—The largest merchant-ships are those employed by the different European companies of merchants who trade to the East Indies. They are in general somewhat larger than our forty-gun ships: they are mounted with twenty cannon on their upper-deck, which are nine-pounders, and six on their quarter-deck, which are six-pounders.

Private Ship of War. See *PRIVATEER*.

Store-Ship, a vessel employed to carry artillery or naval stores for the use of a fleet, fortress, or garrison.

Transport Ship, is generally used to conduct troops from one place to another.

Besides those mentioned above, there are other forms; the principal of which we have collected into one point of view in Plate CCLXXV. so that the reader who is unacquainted with marine affairs may the more easily perceive their distinguishing characters, which are also more particularly described under their respective articles.

In the different kinds of ships referred to above, and distinguished from each other by their size or figure, we have only considered those which are most common in European nations, where the marine art has received the greatest improvements. So far is apparently consistent with the views of utility. To give a circumstantial account of the various species of ships employed in different nations, besides being an almost endless task, would be of little service except to gratify an useless curiosity.

Ship.

To SHIP, is either used actively; as, to embark any person, or put any thing aboard ship: Or passively, to receive any thing into a ship; as, We shipped a heavy sea at three o'clock in the morning.

Ship.

To SHIP, also implies to fix any thing in its place; as, to ship the oars, i. e. to fix them in their rowlocks. To ship the swivel-guns, is to fix them in their sockets, &c.

SHIP-BUILDING.

SHIP-BUILDING may be defined, The manner of constructing ships, or the work itself; as distinguished from **NAVAL ARCHITECTURE**, which may be considered as the theory or art of delineating ships on

a plane. The latter was referred to this place, that we might avoid the impropriety of giving the theory and practice under different articles.

PART I. ART OF DELINEATING SHIPS ON A PLANE.

ALL edifices, whether civil or military, are known to be erected in consequence of certain established plans, which have been previously altered or improved till they have arrived at the desired point of perfection. The construction of ships appears also to require at least as much correctness and precision as the buildings which are founded upon *terra firma*: it is therefore absolutely necessary that the mechanical skill of the shipwright should be assisted by plans and sections, which have been drawn with all possible exactness, examined by proper calculations, and submitted to the most accurate scrutiny.

Naval architecture may be distinguished into three principal parts.

First, To give the ship such an exterior form as may be most suitable to the service for which she is designed.

Secondly, To give the various pieces of a ship their proper figures; to assemble and unite them into a firm compact frame, so that by their combination and disposition they may form a solid fabric, sufficient to answer all the purposes for which it is intended. And,

Thirdly, To provide convenient accommodations for the officers and crew, as well as suitable apartments for the cargo, furniture, provisions, artillery, and ammunition.

The exterior figure of a ship may be divided into the bottom and upper works.

The bottom, or quick-work, contains what is termed the *hold*, and which is under water when the ship is laden. The upper works, called also the *dead-work*, comprehend all that part which is usually above the water when the ship is laden.

The figure of the bottom is therefore determined by the qualities which are necessary for the vessel, and conformable to the service for which she is proposed.

The limits of our design will not admit of a minute description and enumeration of all the pieces of timber which enter into the construction of a ship, nor of a particular description of their assemblage and union, or the manner in which they reciprocally contribute to the solidity of those floating citadels. It nevertheless appears necessary to give a general idea of the use, figure, and station of the principal pieces, to those who are entirely unacquainted with the subject. As our definitions will be greatly illustrated by the proper figures, we have annexed to this article a plate, which comprehends some of the most material draughts, as

well as a representation of the principal pieces employed in naval architecture.

It is usual among shipwrights to delineate three several draughts.

First, The whole length of the ship is represented according to a side-view, perpendicular to the keel, and is termed the *plane of elevation*, or *sheer-draught*. Plate CCXLVI. fig. 1.

Second, The ship is exhibited according to an end-view, and stripped of her planks, so as to present the outlines of the principal timbers; and this is properly termed the *plane of projection*, or the *vertical plane of the timbers*, (fig. 4.) because it shows the projection of their frames relatively to each other.

Third, It is not sufficient to have the vertical curves of the bottom in different places, for a distinct idea of the horizontal curves is also equally necessary and useful: this is obtained by means of water-lines, traced upon what is called the *horizontal plane*, (fig. 2.) In this draught the curves of the transoms called the *round-ast* is also marked, and sometimes the breadth and thickness of the timbers.

The plane of elevation (fig. 1.) determines the length and depth of the keel; the difference of the draughts of water; the length and projection, or rake, of the stem and stern-post; the position of the mid-ship-frame upon the keel, together with that of the principal frames afore and abaft; the load-water line; the wales; the dimensions and situations of the gunports; the projection of the rails of the head and stern-gallery; with the stations of the masts and channels.

This draught, however, conveys no idea of the vertical curve of the ribs or timbers; for as their projection will be only represented in a plane elevated upon the length of the keel, they will appear in this direction no otherwise than as straight lines. To perceive these curves accurately, they must be regarded in another point of view; which will represent their projection upon a vertical plane, supposed to cut the keel at right angles in the place where the ship is broadest. For as all ships are broader near the middle of their length than towards the extremities, it is evident that the timbers are more extended in proportion. The most capacious of these represents what is called the *midship-frame*; and upon the area of this frame is delineated the projection of all the others.

Thus the plane of projection limits the different breadths of a ship in various points of her length, and exhibits the outline of the timbers respectively to each other.

† See
Pl. CLIX.
fig. 2.

other as they are erected upon the keel. Accordingly, this draught ought to present a variety of sections of the ship in different places of her length, and always perpendicular to the surface of the water; so that the eye of the observer, when placed in what may be properly termed the *axis* of the ship, may perceive the several sections at one glance; that is to say, when looking full on the stem from before the ship †, he shall discover the fore-timbers; and when looking from behind, directly on the stern, he shall perceive the form of the after-timbers. See Plate of STERN, fig. 2. 3. at the article STERN; in both of which figures the sections of the inferior timbers are expressed by curved black lines drawn upon the area of the midship-frame, which is already described to be a plane elevated perpendicularly upon the keel at the extreme breadth of the vessel. See MIDSHIP-FRAME.

To form a just idea of this plane, therefore, we ought to suppose a ship resting upon the stocks, in the same position as when afloat upon the water. Thus a variety of black vertical lines may be drawn at equal distances upon the bottom, which is white, to form different outlines of the ship corresponding to the timbers within. It is to be observed, that the fashion of the inferior timbers must conform to the figure of the midship-frame, which is placed in the fullest part of the ship; and as the planes of all the other timbers diminish in a certain progression as they approach the stem and stern, they are properly delineated on the plane of the midship-frame, which also represents the depth of the keel and length of the midship-beam.

As the two sides of a ship ought to be exactly alike, it is judged sufficient to represent the sections of the fore-part of the ship on the left side, and those in the after-part on the right side, so as to perceive all the sections, as well as before as abaft, upon one plane. See Plate CCLXVI. fig. 4.

However necessary it may be to understand precisely the vertical curves of the bottom, it is no less requisite to have a just idea of those which are horizontal.

The horizontal, or floor-plane, is that upon which the whole frame is erected, and will be more clearly understood by previously describing the water-lines and ribbands of which it is composed.

When a ship floats upon the stream, it is evident that her upper works will be separated from the bottom by the surface of the water, which will accordingly describe an imaginary horizontal line upon the bottom from the stem to the stern-post.

The most elevated of those lines is termed the *load water-line*, which is supposed to be drawn by the surface of the water on the upper part of the bottom, when she is sufficiently laden for a sea-voyage. For if we suppose this surface a rule, and thereby describe a corresponding black line along the vessel's bottom, that line will be distinguished upon the bottom, which is white, and represent what is called the *load water-line*.

If the ship is lightened of any part of her lading, and preserves the same difference in her draught of water at the two ends; or, what is the same thing, if she is lightened so as to preserve the same equilibrium of the keel with regard to the surface of the water, it is evident that she will rise higher out of the water, so that the black line already described will be elevated

above it; and another black line may be delineated upon the bottom, close to the surface of the water, which will exhibit a second water-line parallel to the first, but nearer the keel, in proportion to the number of feet which the ship has risen.

Thus by lightening a ship gradually, and at the same time preserving the direction of her keel, or the angle which the keel makes with the surface of the water, a variety of water-lines may be drawn parallel to each other and to the load water-line. See a farther illustration of these lines in the article WATER-LINE.

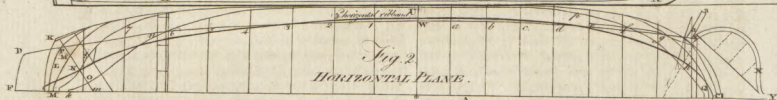

The ribbands are likewise of great utility in ship-building; they are narrow and flexible planks placed on the bottom at different heights, so as to form a sort of mould for stationing the inferior timbers between the principal ones. They differ from the water-lines, inasmuch as the latter have only one curve, which is horizontal; whereas the ribbands, besides their horizontal one, have a vertical curve. To convey a just idea of these curves, which cannot be represented on one draught at their full length, without an oblique section of the ship's length, it will be necessary to have recourse to two planes; that of the elevation, which exhibits their vertical curve; and to the floor-plane, upon which the horizontal curve is expressed. See RIBBAND, and TIMBER.

These different lines are extremely useful in exhibiting the various curves of a ship's bottom, that as they are gradually diminished, their uniformity or irregularity may be discovered by the skilful artist.

The qualities required in a ship ought to determine the figure of the bottom. A ship of war, therefore, should be able to sail swiftly, and carry her lower tier of guns sufficiently out of the water; otherwise a small ship will have the advantage of a large one, inasmuch as the latter cannot open her lower battery in a fresh side-wind without being exposed to extreme danger by receiving a great quantity of water in at her ports between decks. A merchant-ship ought to contain a large cargo of merchant-goods, and be navigated with few hands: And both should be able to carry sail firmly; steer well; drive little to leeward; and sustain the shocks of the sea without being violently strained.

The first thing to be established in the draught of a ship is her length; and as a ship of war, according to her rate, is furnished with a certain number of cannon, which are placed in battery on her decks, it is necessary that a sufficient distance should be left between their ports to work the guns with facility; and particularly to leave space enough between the foremost gun and the stem, and between the aftmost gun and the stern-post on each side, on account of the arching or inward curve of the ship toward her extremities.

When the length of a ship is determined, it is usual to fix her breadth by the dimensions of the midship-beam. On this occasion the shipwrights, for the most part, are conducted by rules founded on their own observation; for having remarked, that some vessels, which by repeated experience have been found to answer all the purposes of navigation, have a certain breadth in proportion to their length, they have inferred that it would be improper to depart from this proportion: but as other ships have been constructed with

Fig. 1.
ELEVATION.Fig. 2.
HORIZONTAL PLANE.Fig. 3.
PIECES of the HULL.Fig. 4.
PROJECTION.

with different breadths, which were equally perfect, a variety of different general rules have been adopted by these artists; who are accordingly divided in their opinions about the breadth which ought to be assigned to a ship relatively with her length, whilst each one produces reasons and experience in support of his own standard. Those who would diminish the breadth, allege, 1. That a narrow vessel meets with less resistance in passing through the water: 2dly, That by increasing the length she will drive less to leeward: 3dly, That, according to this principle, the water-lines will be more conveniently formed to divide the fluid: 4thly, That a long and narrow ship will require less sail to advance swiftly; that her masts will be lower, and her rigging lighter; and, by consequence, the seamen less fatigued with managing the sails, &c. Those, on the contrary, who would enlarge the breadth, pretend, 1st, That this form is better fitted to preserve a good battery of guns: 2dly, That there will be more room to work the guns conveniently: 3dly, That, by carrying more sail, the ship will be enabled to run faster; or, that this quality will at least overbalance the advantage which the others have of more easily dividing the fluid: 4thly, That being broader at the load-water line, or place where the surface of the water describes a line round the bottom, they will admit of being very narrow on the floor, particularly towards the extremities: And, 5thly, That a broad vessel will more readily rise upon the waves than a narrow one. From such opposite principles has resulted that variety of standards adopted by different shipwrights.

It has been remarked above, that a ship of war must carry her lower tier of cannon high enough above the water, otherwise a great ship which cannot open her lower battery, when sailing with a fresh side-wind, may be taken by a small one that can make use of her cannon.

A ship should be duly poised, so as not to dive or pitch heavily, but go smooth and easy through the water, rising to the waves when they run high and the ship has reduced her sail to the storm; otherwise they will break aboard, and strain the decks or carry away the boats; the masts are likewise in great danger from the same cause.

A ship should sail well when large and before the wind, but chiefly close-hauled, or with a side-wind, and her sails sharp-trimmed, and then not fall off to the leeward.

Now, the great difficulty lies in uniting so many different qualities in one ship; which seems to be nearly impossible: the whole art, therefore, consists in forming the body in such a manner that none of these qualities should be entirely destroyed, and in giving a preference to that which is chiefly required in the particular service for which the vessel is designed. We shall briefly show the possibility of uniting them all in one ship, that each of them may be easily discerned: when it happens otherwise, the fault must lie in the builder, who has not applied himself to study the fundamental rules and principles of his art.

To make a ship carry a good sail. A flat floor-timber, and somewhat long, or the lower futtock pretty round, a straight upper futtock, the top-timber to throw the breadth out aloft; at any rate, to carry her main breadth as high as the lower decks. Now, if

the rigging be well adapted to such a body, and the upper works lightened as much as possible, so that they all concur to lower the centre of gravity, there will be no room to doubt of her carrying a good sail.

To make a ship steer well, and answer the helm quickly. If the fashion-pieces be well formed, the tuck, or spreading parts under the stern, carried pretty high, the midship-frame well forward, a considerable difference in the draught of water abaft more than before, a great rake forward and none abaft, a snug quarter-deck and fore-castle; all these will make a ship steer well. A ship which sails well will certainly steer well.

To make a ship carry her guns well out of the water. A long floor-timber, and not of great rising; a very full midship-frame, and low tuck, with light upper works.

To make a ship go smoothly through the water without pitching hard. A long keel, a long floor, not to rise too high afore and abaft; but the area or space continued in the fore-body, according to the respective weights they are to carry; all these are necessary to make a ship go smoothly through the water.

To make a ship keep a good wind, and drive little to the leeward. A good length by the keel; not too broad, but pretty deep in the hold, which will occasion her to have a short floor-timber and a great rising. As such a ship will meet with great resistance in the water going over the broadside, and little when going ahead, she will not fall much to the leeward.

Now, some builders imagine it is impossible to make a ship carry her guns well, bear a good sail, and be a prime sailer; because it would require a very full bottom to gain the first two qualities, whereas a sharp ship will answer better for the latter: but when it is considered that a full ship will carry a great deal more sail than a sharp one, a good artist may so form the body, as to have all these three good qualities, and also steer well.

We shall now proceed to describe the principal pieces of which a ship is composed, and to explain the principal draughts used in the construction thereof.

As the several lines exhibited in the planes of elevation, projection, &c. will be rendered more intelligible by a previous account of those pieces, it may not be improper to begin with reciting their names, and giving a summary description of their uses and stations. They are for the most part represented according to the order of their disposition in that part of Plate CCLXVI. which is termed *pieces of the hull*.

A. The pieces which compose the keel, to be securely bolted together, and clinched.

B. The stern-post, which is tenanted into the keel, and connected to it by a knee, G. It supports the rudder, and unites the sides of the ship abaft.

C. The stem, which is composed of two pieces scarfed together: it is an arching piece of timber, into which the ship's sides are united forwards.

D. The beams, which are used to support the decks, and confine the sides to their proper distance.

E. The false post, which serves to augment the breadth of the stern-post, being also tenanted into the keel.

F. The knees which connect the beams to the sides.

40 Q

G. The

Plate
CCLXVII.
fig. 3.

G. The knee of the stern-post, which unites it to the keel.

H. The apron, in two pieces: it is fayed on the inside of the stem, to support the scarf thereof; for which reason the scarf of the former must be at some distance from that of the latter.

I. The stemson, in two pieces, to reinforce the scarf of the apron.

K. The wing-transom: it is fayed across the stem-post, and bolted to the head of it, having its two ends let into the fashion-pieces.

L. The deck-transom, parallel to the wing-transom, and secured in the same manner.

M N. The lower transoms.

O. The fashion-piece on one side; the heel of it is connected with the dead-wood, and the head is secured to the wing-transom.

P. The top-timbers, or upper parts of the fashion-pieces.

Q. The knees, which fashion the transoms to the ship's side.

R. The breast-hooks, in the hold; they are fayed across the stem, to strengthen the fore-part of the ship.

S. The breast-hooks of the deck: they are placed immediately above the former, and used for the same purposes.

T. The rudder, which is joined to the stern-post by hinges, and serves to direct the ship's course.

U. The floor-timbers; they are laid across the keel, to which they are firmly bolted.

V. The lower futtocks, and,

W. The top-timbers, which are all united to the floor-timbers, forming a frame that reaches from the keel to the top of the side.

X. The pieces which compose the kelson: they are scarfed together like the keel pieces, and placed over the middle of the floor-timbers, upon each of which they are scored about an inch and a half, as exhibited by the notches.

Y. The several pieces of the knee of the head; the lower part of which is fayed to the stem; the heel being scarfed to the fore-foot.

Z. The cheeks of the head or knees, which connect the head to the bows on each side.

&. The standard of the head, which fastens it to the stem.

a. The cat-heads, one of which lies on each bow, projecting outwards like the arm of a crane. They are used to draw the anchors up to the top of the side without injuring the bow.

b. The bits, to which the cable is fastened when the ship rides at anchor.

c. The false post, in two pieces, fayed to the fore-part of the stern-post.

d. The side-counter-timbers, which terminate the ship abait within the quarter-gallery.

e e. Two pieces of dead-wood, one afore and another abait, fayed on the keel.

In vessels of war, the general dimensions are established by authority of officers appointed by the government to superintend the building of ships. In the merchant-service, the extreme breadth, length of the keel, depth in the hold, height between decks and in the wale, are agreed on by contract;

and from these dimensions the shipwright is to form a draught suitable to the trade for which the ship is designed. Plate
CCLXVI.
fig. 3.

In projecting the draught of a vessel of war, the first article to be considered is her length. As all ships are much longer above than below, it is also necessary to distinguish the precise part of her height from which her length is taken: this is usually the lower gun-deck, or the load water-line. It has been already observed, that water-lines are described longitudinally on a ship's bottom by the surface of the water in which she floats, and that the line which determines her depth under the water is usually termed the load water-line. In this draught it will be particularly necessary to leave sufficient distance between the ports.

The next object is to establish the breadth by the midship-beam. Although there is great difference of opinion about proportioning the breadth to the length, yet it is most usual to conform to the dimensions of ships of the same rate. After the dimensions of the breadth and length are determined, the depth of the hold must be fixed, which is generally half the breadth: but the form of the body should be considered on this occasion; for a flat floor will require less depth in the hold than a sharp one. The distance between the decks must also be settled.

We may then proceed to fix the length of the keel; by which we shall be enabled to judge of the rake of the stem and stern-post. The rake is known to be the projection of the ship at the height of the stem and stern-post beyond the ends of the keel afore and abaft, or the angle by which the length is increased as the fabric rises. To these we may also add the height of the stem and wing-transom.

After these dimensions are settled, the timbers may be considered which form the sides of the ship. A frame of timbers, which appears to be one continued piece, is composed of one floor-timber, U, whose arms branch outward to both sides of the ship; two or three futtocks, V V; and a top-timber, W. The futtocks are connected to the upper arms of the floor-timbers on each side of the ship, and serve to prolong the timber in a vertical direction: and the top-timbers are placed at the upper part of the futtocks for the same purpose. All these being united, and secured by cross-bars, form a circular inclosure, which is called a frame of timbers. And as a ship is much broader at the middle than at the extremities, the arms of the floor-timber will form a very obtuse angle at the extreme breadth: but this angle decreases in proportion to the distance of the timbers from the midship-frame, so that the foremost and aftermost ones will form a very acute angle. Floor-timbers of the latter sort are usually called *crutches*.

Shipwrights differ extremely in determining the station of the midship-frame; some placing it at the middle of the ship's length, and others further forward. They who place it before the middle allege, that if a ship is full forwards, she will meet with no resistance after she has opened a column of water; and that the water so displaced will easily unite abaft, and by that means force the ship forward; besides having more power on the rudder, in proportion to its distance from the centre of gravity: this also comes nearer the form

form of filles, which should seem the most advantageous for dividing the fluid.

When the rising of the midship-floor-timber is decided, we may then proceed to describe the rising-line of the floor, on the stern-post abaft, and on the stem afore.

The height of the lower-deck is the next thing to be considered: it is determined in the middle by the depth of the hold; and some builders make it no higher than the stem; but they raise it abaft as much above its height in the middle as the load water-mark, or draught of water abaft, exceeds that afore. With regard to the height between decks, it is altogether arbitrary, and must be determined by the rate of the ship and the service she is designed for.

It is also necessary to remember the sheer of the wales, and to give them a proper hanging; because the beauty and flatness of a ship greatly depend upon their figure and curve, which, if properly drawn, will make her appear airy and graceful on the water.

We come now to consider the upper works, and all that is above water, called the *dead-work*: and here the ship must be narrower, so that all the weight lying above the load water-line will thereby be brought nearer the middle of the breadth, and of course the ship will be less strained by the working of her guns, &c. But although some advantages are acquired by diminishing the breadth, above water, we must be careful not to narrow her too much; as there must be sufficient room left on the upper deck for the guns to recoil. The security of the masts should likewise be remembered, which requires sufficient breadth to spread the shrouds. A deficiency of this sort may indeed be in some measure supplied by enlarging the breadth of the channels.

We come to explain the sheer-draught, or plane of ELEVATION of a sixty-gun ship; wherein we have been attentive to make the same letters refer to the same objects, as in the explanation of the PIECES, as above; at least when the same objects are in both figures.

Fig. 1.

A A. Is the keel, whose upper edge is prolonged by the dotted line *pg*, upon the extremities of which are erected perpendiculars which determine the height of the wing-transom K, and the length of the gun-deck K C.

A B. The stern-post.

A C. The stem.

D D. The quarter-gallery, with its windows.

E F. The quarter-pieces, which limit the stern on each side.

F. The taffarel, or upper piece of the stern.

F G. Profile of the stern, with its galleries.

H. The gun-ports.

I. The channels, with their dead-eyes and chain-plates.

K. The wing-transom.

K G. The counter.

L B. The deck-transom.

M N O. The first, second, and third transoms, of which O k is the third or lowest.

m O L P. The direction of the fashion-piece, having its breadth canted ast towards the stern.

Q R. The main skeeds, for hoisting in the boats clear of the ship's side.

L Q Z. The main-wale, with its sheer afore and abaft.

D K X. The channel-wales, parallel to the main-wale.

S U S. The sheer-rail, parallel to the wales.

T t. The rudder.

A t F. The rake of the stern.

V W V. The waist-rail.

P i i. The drift-rails abaft; and i a, the drift-rails forward.

T U C. The water-line.

X X. The rails of the head.

Y. The knee of the head, or cutwater.

Z Z. The cheeks of the head.

a a. The cat-head.

M ⊕ C. The rising line of the floor.

k u C. The cutting-down line, which limits the thickness of all the floor-timbers, and likewise the height of the dead-wood afore and abaft.

⊕ a U W. The midship-frame.

a, b, c, d, e, f, g, h. The frames or timbers in the fore-body of the ship, i. e. before the midship frame.

1, 2, 3, 4, 5, 6, 7, 8, 9. The timbers in the after-body, or which are erected abaft the midship-frame.

As the eye of a spectator is supposed in the projection to view the ship's side in a line perpendicular to the plane of elevation, it is evident that the convexity will vanish, like that of a cylinder or globe, when viewed at a considerable distance; and that the frames will consequently be represented by straight lines, except the fashion-piece abaft and the knuckle-timber forward.

It has been already observed, that the plane of projection may be defined a vertical delineation of the curves of the timbers upon the plane of the midship-frame, which is perpendicular to that of the elevation. It is necessary to observe here, that the various methods by which these curves are described, are equally mechanical and arbitrary. In the latter sense, they are calculated to make a ship fuller or narrower, according to the service for which she is designed; and in the former they are drawn according to those rules which the artist has been implicitly taught to follow, or which his fancy or judgment has esteemed the most accurate and convenient. They are generally composed of several arches of a circle, reconciled together by moulds framed for that purpose. The radii of those arches, therefore, are of different lengths, according to the breadth of the ship in the place where such arches are swept; and they are expressed on the plane of projection either by horizontal or perpendicular lines: the radii of the breadth-sweeps being always in the former, and the radii of the floor-sweeps in the latter direction. These two arches are joined by a third, which coincides with both, without intersecting either. The curve of the top-timber is either formed by a mould which corresponds to the arch of the breadth-sweep, or by another sweep whose centre and radius are without the plane of projection. The breadth of the ship, at every top-timber, is limited by an horizontal line drawn on the floor-plane, called the *half-breadth of the top-timbers*. The extreme breadth is also determined by another horizontal line on the floor-plane; and the lines of half-breadth are thus mutually transferable, from the projection and floor-planes, to each other.

Plate
CCLXVI.

The necessary data by which the curves of the timbers are delineated, then, are the perpendicular height from the keel; the main, or principal breadth; and the top-timber breadth: for as a ship is much broader near the middle of her length than towards the end, so the is broader in the middle of her height than above and below; and this latter difference of breadth is continued throughout every point of her length. The main breadth of each frame of timbers is therefore the ship's breadth nearly in the middle of her height in that part: and the top-timber breadth is the line of her breadth near the upper ends of each timber. It has been already observed, that as both sides of a ship are alike, the artificers only draw one side, from which both sides of the ship are built: therefore the timbers abaft the midship-frame are exhibited on one side of the plane of projection, and the timbers before it on the other.

Plane of Projection.

Fig. 4.

A, The keel.

BC, The line which expresses the upper edge of the keel, from which the height of each timber and height of its different breadths are measured.

BD, and CE, Perpendiculars raised on the line BC, to limit the ship's extreme breadth and height amid-ships; or, in other words, to limit the breadth and height of the midship-frame.

AF, A perpendicular erected from the middle of the keel to bisect the line of the ship's breadth in two equal parts.

F * g, The half-breadth line of the aftmost top-timber; being the uppermost horizontal line in this figure.

Note, The seven lines parallel to and immediately under this, on the right-side of the line AF, are all top-timber half-breadths, abaft the midship-frame; the lowest of which coincides with the horizontal line DE.

The parallel horizontal lines nearly opposite to these, on the left side of the line AF, represent the top-timber half-breadths in the fore-body, or the half-breadths of the top-timbers before the midship-frame.

G, H, I, Q, R, S, T, The radii of the breadth-sweeps abaft the midship-frame; those of the breadth-sweeps in the fore-body, or before the midship-frame are directly opposite on the right side.

⊕ A, The midship-frame, from the extreme breadth downwards.

1, 2, 3, 4, 5, 6, 7, 8, 9, The outlines of the timbers abaft the midship-frame, in different parts of their height.

a, b, c, d, e, f, g, h, The outlines of the timbers before the midship-frame, in different parts of their height, b being the foremost or knuckle timber.

K i, the wing-transom, whose ends rest upon the fashion-piece.

L, The deck-transom, parallel to and under the wing-transom.

M N O, The lower-transoms, of which O k is the third and lowest.

m k P, The dotted line, which expresses the figure of the fashion-piece, without being canted aft.

P, The upper-part, or top-timber of the fashion-piece.

n, o, p, q, r, s, The radii of the floor-sweeps, abaft

the midship-frame: those before the midship-frame are ^{Plate} all parallel. ^{CCLXVI.}

1st R^d, 2d R^d, 3d R^d, 4th R^d, The diagonal ribbands abaft the midships i, u, x, y. The same ribbands expressed in the fore-body.

It has been remarked above, that the horizontal plane is composed of water-lines and ribbands; it also contains the main and top-timber-breadth lines, or the longitudinal lines by which the main-breadth and top-timber-breadth are limited in every point of the ship's length. The horizontal curve of the transoms and harpins are also represented therein; together with the planes of the principal timbers, the cant of the fashion-piece, the length of the rake afore and abaft, the projection of the cat-heads, and the curve of the upper rail of the head, to which the curves of the lower ones are usually parallel.

HORIZONTAL PLANE.

B A C, The line of the ship's length, passing thro' Fig. 2 the middle of the stem and stern-post.

B, The upper-end of the stern-post.

C, The upper-end of the stem.

B F, The length of the rake abaft.

D W X, The top-timber-breadth line, or the line which limits the breadth of each top-timber.

D F, The breadth of the aftmost timber at the taffarel.

B K, The wing-transom.

B L P, The horizontal curve of the deck-transom.

M M, The horizontal curve, or round aft, of the first transom.

M N, The horizontal curve of the second transom: it is prolonged into a water-line, N 8 7.

k O, The horizontal curve of the third transom, which is also prolonged into another water-line, O n,

U, p, Q.

m O P, The plane of the fashion-piece, as canted aft.

⊕ W U, The plane of the midship-frame.

a, b, c, d, e, f, h, The planes of the timbers before the midship-frame.

1, 2, 3, 4, 5, 6, 7, 8, 9, The planes of the timbers abaft the midship-frame.

X X, The figure of the upper-rail of the head.

C Y, The projection of the knee of the head.

The third horizontal ribband is marked on the plate.

a a, The projection of the cat-head.

Thus we have endeavoured briefly to explain the nature and uses of the principal draughts used in the construction of a ship, which reciprocally correspond with each other in the dimensions of length, breadth, and depth. Thus the plane of elevation is exactly of the same length with the horizontal or floor-plane. The several breadths of the timbers in the fore-planes, and that of the projection, are mutually transferable; and the real height of the timbers in the projection exactly conforms to their height in the elevation. Thus let it be required to transfer the height of the wing-transom from the elevation to the projection:

Extend the compasses from the point K, in the elevation, down to the dotted line prolonged from the upper-edge of the keel, and setting the other foot in the point p, then shall the line K p be the perpendicular

cular height in the wing-transom: transfer this from the middle of the line B A C, in the projection, to the point K in the perpendicular A F, then will A K be the height of the wing-transom in the plane of projection: and thus the height of all the transoms may be laid from the former upon the latter.

Again: Let it be required to transfer the main-breadth of the midship-frame from the projection to the horizontal plane: Set one foot of the compasses in the point \oplus on the perpendicular C E, and extend the other along the main-breadth-sweep \oplus G, till it touches the perpendicular A F parallel to C E: lay this distance upon the horizontal plane from the point u in the line of the ship's length, B A C, along the plane of the midship-frame to the point \oplus ; so shall the line W U be the breadth of the midship-frame on the horizontal plane.

Thus also the top-timber-breadth, or the distance of each top-timber from the middle of the ship's breadth, may be in the same manner transferred, by extending the compasses from the line B A C, in

the horizontal plane, to the top-timber-breadth line, Plate CCLXVI. will give its proper dimensions thereon.

In the same manner the breadths of all the timbers may be laid from the projection to the horizontal plane, and *vice versa*, from that to the projection. Thus the height of each timber may also be transferred from the elevation to the projection, &c.

The principal utility of these draughts, therefore, is to exhibit the various curves of the ship's body, and of the pieces of which it is framed, in different points of view, which are either transverse or longitudinal, and will accordingly prevent them in very different directions. Thus the horizontal curves of the transoms and water-lines are represented on the floor-plane, all of which are nearly straight lines in the elevation and projection; and thus the vertical curves of the timbers are all exhibited on the projection, although they appear as straight lines in the elevation and floor-plane.

PART II. OF CONSTRUCTING SHIPS.

THE pieces by which this complicated machine, a ship, is framed, are joined together in various places, by *scarfing, rabitting, tenanting, and scoring*. See those articles.

During the construction of a ship, she is supported in the dock, or upon a wharf, by a number of solid blocks of timber placed at equal distances from and parallel to each other, as may be seen in the article LANCHING; she is then laid to be on the stocks.

The first piece of timber laid upon the blocks is generally the keel: we say *generally*, because, of late, a different method has been adopted in some of the royal dock-yards, by beginning with the floor-timbers; the artists having found that the keel is often apt to rot during the long period of building a large ship of war. The pieces of the keel are scarfed together, and bolted, forming one entire piece, A A, which constitutes the length of the vessel below. At one extremity of the keel is erected the stem. It is a strong piece of timber incurvated nearly into a circular arch, or, according to the technical term, *compassing*, so as to project outwards at the upper-end, forming what is called the *rake forward*. In small vessels this is framed of one piece; but in large ships it is composed of several pieces scarfed and bolted together, as expressed in the explanation of fig. 3. and in those terms separately. At the other extremity of the keel is elevated the stern-post, which is always of one entire straight piece. The heel of it is let into a mortise in the keel, and having its upper end to hang outwards, making an obtuse angle with the keel, like that of the stem: this projection is called the *rake abaft*. The stern-post, which ought to support the stern, contains the iron-work, or hinges of the rudder, which are called *googings*, and unites the lower-part of the ship's sides abaft. See the connection of those pieces in the *Elevation*, fig. 1.

Towards the upper-end of the stern-post, and at right angles with its length, is fixed the middle of the wing-transom, where it is firmly bolted. Under this

is placed another piece parallel thereto, and called the *deck-transom*, upon which the after-end of the lower-deck is supported. Parallel to the deck-transom, and at a proper distance under it, another piece is fixed to the stern-post, called the *first transom*; all of which serve to connect the stern-post to the fashion-pieces. Two more transoms, called the *second* and *third*, are also placed under these, being likewise attached to the fashion-pieces, into which the extremities of all the transoms are let. The fashion-pieces are formed like the other timbers of the ship, and have their heels resting on the upper-part of the keelson, at the after-extremity of the floor-ribsands.

All these pieces, viz. the transoms, the fashion-pieces, and their top-timbers, being strongly united into one frame, are elevated upon the stern-post; and the whole forms the structure of the stern, upon which the galleries and windows, with their ornaments, are afterwards built.

The stem and stern-post being thus elevated upon the keel, to which they are securely connected by knees and arched pieces of timber bolted to both; and the keel being raised at its two extremities by pieces of dead-wood, the midship floor-timber is placed across the keel, whereto it is bolted through the middle. The floor-timbers before and abaft the midship-frame are then stationed in their proper places upon the keel; after which the keelson, which, like the keel, is composed of several pieces scarfed together, is fixed across the middle of the floor-timbers, to which it is attached by bolts driven through the keel, and clinched on the upper-part of the keelson. The futtocks are then raised upon the floor-timbers, and the hawse-pieces erected upon the cant-timbers in the fore-part of the ship. The top-timbers on each side are next attached to the head of the futtocks, as already explained in Part I. The frames of the principal timbers being thus completed, are supported by ribsands. See RIBSANDS.

The

The ribs of the ship being now stationed, they proceed to fix on the planks, of which the wales are the principal, being much thicker and stronger than the rest; as is represented in the *MIDSHIP-Frame*. The harpins, which may be considered as a continuation of the wales at their fore-ends, are fixed across the hawse-pieces, and surround the fore-part of the ship. The planks that inclose the ship's sides are then brought about the timbers; and the clamps, which are of equal thickness with the wales, fixed opposite to the wales within the ship: these are used to support the ends of the beams, and accordingly stretch from one end of the ship to the other. The thick-stuff, or strong planks of the bottom within-board, are then placed opposite to the several scarfs of the timbers, to reinforce them throughout the ship's length. The planks employed to line the ship, called the *ceiling*, or *foot-waling*, is next fixed in the intervals between the thick-stuff of the hold. The beams are afterwards laid across the ship to support the decks, and are connected to the side by lodging and hanging knees; the former of which are exhibited in their proper stations in Plate LXXXVIII. F. and the hanging ones, together with the breadth, thickness, and position of the keel, floor-timbers, futtocks, top-timbers, wales, clamps, thick-stuff, planks within and without, beams, decks, &c. are seen in the *MIDSHIP-Frame*.

The cable-bits being next erected, the *carlings* (A), and *ledges* (B), which are represented in Pl. LXXXVIII. are disposed between the beams to strengthen the deck. The water-ways are then laid on the ends of the beams throughout the ship's length, and the spiricketing fixed close above them. The upper-deck is then planked, and the string placed under the gunnel or plash-er in the waist. The disposition of those latter pieces on the timbers, viz. the water-ways, spiricketing, upper-deck, string, and gunnel, are also represented in the *MIDSHIP-Frame*.

They proceed next to plank the quarter-deck and fore-castle, and to fix the partners of the masts and capsterns with the coamings of the hatches. The breast-hooks are then bolted across the stem and bow within-board; the step of the fore-mast placed on the keelson; and the riders, exhibited in the *MIDSHIP-Frame*, fayed on the inside of the timbers to reinforce the sides in different places of the ship's length. The pointers, if any, are afterwards fixed across the hold

diagonally to support the beams; and the crotches stationed in the after-hold to unite the half-timbers. The steps of the main-mast and capsterns are next placed; the planks of the lower-decks and orlop laid; the navel-hoods fayed on the hawse-holes; and the knee of the head, or cutwater, connected to the stem. The figure of the head is then erected, and the trail-board and cheeks are fixed on the sides of the knee.

The taffarel and quarter-pieces, which terminate the ship abaft, the former above and the latter on each side, are then disposed; and the stern and quarter galleries framed and supported by their brackets. The pumps, with their well, are next fixed in the hold; the limber-boards laid on each side of the keelson; and the garboard strake fixed on the ship's bottom next to the keel without.

The hull being thus fabricated, they proceed to separate the apartments by bulk-heads, or partitions; to frame the port-lids; to fix the cat-heads and ches-trees; to form the hatchways and scuttles, and fit them with proper covers or gratings. They next fix the ladders whereby to mount or descend the different hatchways; and build the manger on the lower-deck, to carry off the water that runs in at the hawse-holes when the ship rides at anchor in a sea. The bread-room and magazines are then lined; and the gunnel, rails, and gangways, fixed on the upper part of the ship. The clats, kevels, and ranges, by which the ropes are fastened, are afterwards bolted or nailed to the sides in different places.

The rudder, being fitted with its irons, is next hung to the stern-post; and the tiller, or bar, by which it is managed, let into a mortise at its upper-end. The scuppers, or leaden tubes, that carry the water off from the decks, are then placed in holes cut through the ship's sides; and the standards, represented in the *MIDSHIP-Frame*, bolted to the beams and sides above the decks to which they belong. The poop-lanterns are last fixed upon their cranes over the stern; and the bilge-ways, or cradles, placed under the bottom, to conduct the ship readily into the water whilst launching.

As the various pieces which have been mentioned above, are explained at large in their proper places, it would have been superfluous to have entered into a more particular description of them here.

S H I

Ship-money.

SHIP-Money, was an imposition charged upon the people, towns, cities, boroughs, and counties of this realm, in the reign of king Charles I. by writs, commonly called *ship-writs*, under the great seal of England, in the years 1635 and 1636, for the providing and furnishing certain ships for the king's service, &c. which was declared to be contrary to the laws and statutes of this realm, the *petition of right* and liberty of the subject, by stat. 17 Car. I. c. 14. See *Blackst. Comment* Vol. IV. p. 30.

SHIP-Shape, according to the fashion of a ship, or in the manner of an expert sailor; as, The mast is not

S H I

rigged ship-shape; Trim your sails ship-shape.

SHIPPING, a multitude of vessels. Thus we say, The harbour is crowded with shipping.

Defending Ships from Lightning. This is effected either by a continued conductor or chain, fixed to the top of the highest mast, and brought from thence into the sea. For the greater security, a chain or conductor may be affixed to each mast. See the articles *ELECTRICITY* and *LIGHTNING*.

Of late it has been observed, that a coating of lamp-black and tar is an effectual security against any stroke of lightning. But this acts not in the way of a conductor,

Shipping.

(A) These are short pieces of timber ranging fore and aft, from one of the deck-beams to another, into which their ends are scored: they are used to sustain and fortify the smaller beams of the ship.

(B) These are certain small pieces of timber placed athwart-ships, under the decks of a ship, in the interval between the beams; as exhibited in the representation of the deck, Plate LXXXVIII.

Shire,
Shirley.

ductor, but as a repellent; being such a strong negative electric, that lightning itself seems unable to pierce it. However, though this would effectually protect the malts, it might otherwise be very dangerous, as the electric matter repelled from the malt might dart down upon the decks, and be productive of incredible mischief. The conductors or chains are therefore preferable, and should always be conveyed into the sea by the shortest way possible.

SHIRE, a Saxon word signifying a division; but a county, *conitatus*, is plainly derived from *comes*, the "count of the Franks;" that is, the earl, or alderman (as the Saxons called him) of the shire, to whom the government of it was intrusted. This he usually exercised by his deputy, still called in Latin *vice-comes*, and in English the *sheriff*, *shrieve*, or *shire-reeve*, signifying the "officer of the shire;" upon whom, by process of time, the civil administration of it is now totally devolved. In some counties there is an intermediate division between the shire and the hundred; as lathes in Kent, and rapes in Suffex, each of them containing about three or four hundreds a-piece. These had formerly their lathes-reeves and rape-reeves, acting in subordination to the shire-reeve. Where a county is divided into three of these intermediate jurisdictions, they are called *trithings*, which were anciently governed by a trithing-reeve. These trithings still subsist in the large county of York, where, by an easy corruption, they are denominated *ridings*; the north, the east; and the west riding.

SHIRLEY (James), an eminent English poet in the 17th century, was born at London about the year 1594. He was educated at Merchant-taylor's school, and thence removed to Oxford. Some time after he went to Cambridge, where, entering into holy orders, he took cure at or near St Albans. In the mean time, growing unsettled in his principles, he changed his religion for that of Rome, left his living, and taught a grammar-school in St Albans. But this employment becoming uneasy to him, he retired to London, lived in Gray's Inn, and became a writer of plays. By this he gained not only a livelihood, but also great respect and encouragement from persons of quality; especially from the queen, wife to king Charles I. who made him her servant. When the rebellion broke out, he was obliged to leave London with his family, (for he had a wife and children); and being invited by his patron, William, earl, afterwards duke, of Newcastle, to follow his fortune in the civil wars, he attended his lordship. On the decline of the king's cause he retired to London; where, among others of his friends, he found Mr Stanley, author of the *Lives of the Philosophers*, who supported him for the present. The acting of plays being prohibited, he returned to his old occupation of teaching school; which he did at White-Friars. At the Restoration, several of his plays were acted with applause. In 1666 he was forced, by the great fire, from his house near Fleet-street, into St Giles's in the Fields; where both he and his wife, being exceedingly afflicted by the loss and terror which the fire had occasioned, died within the space of 24 hours. He was by many considered as one of the most noted dramatic poets of his time; and some thought him even equal to Fletcher. Besides his plays, which are 38 in number, he wrote a volume of poems, and some tracts on grammar.

Shirt
||
Shoe.

SHIRT, a loose garment, commonly of linen, worn next the body.—Some dispute about changing the linen when a person is sick. Clean linen promotes perspiration, and it may be renewed as often as the patient pleases, whether the disorder be of the acute or the chronic kind. Except during a crisis in fevers, whilst the patient is in a sweat, a change of linen, if well dried and warmed, may be daily used.

SHIVERS, in the sea-language, names given to the little rollers, or round wheels of pulleys.

SHOAD, among miners, denotes a train of metalline stones, serving to direct them in the discovery of mines.

SHOAL, in the sea language, denotes a place where the water is shallow.

SHOCK, in electricity. The effect of the explosion of a charged body, that is, the discharge of its electricity on any other body, is called the *electric shock*.

SHOE, a covering for the foot, usually of leather.

Its structure, though the object of a particular art, is too popular to need explaining. See **CORDEWAINER**.

Its history is more obscure. Bened. Baudoin, a shoemaker by profession, has a learned treatise of the ancient shoe, *De solea veterum*; where the origin, matter, form, &c. thereof, are particularly inquired into.—Baudoin maintains, that God, in giving Adam skins of beasts to clothe him, did not leave him to go barefooted, but gave him shoes of the same matter. That after raw skins, men came to make their shoes of rushes, broom, paper, flax, silk, wood, iron, silver, and gold: so different has their matter been.—Nor was their form more stable, with regard either to the shape, colour, or ornaments: they have been square, high, low, long; and quite even, cut, carved, &c.

Pliny, *lib. vii. c. 56*. tells us, that one Tychius of Bæotia was the first who used shoes.—M. Nilant, in his remarks upon Baudoin, observes, that he quotes Xenophon in vain, to show that even in his time they still wore shoes of raw skins. Xenophon relates, that the 10,000 Greeks who had followed the young Cyrus, wanting shoes in their retreat, were forced to cover their feet with raw skins, which occasioned them great inconveniences. Nilant will not even allow that the shoes of the country-people, called *carbatine* and *peroneæ*, were of crude skin, without any preparation.

The patricians among the Romans wore an ivory crescent on their shoes. Heliogabalus had his shoes covered over with a very white linen; in conformity to the priests of the sun, for whom he professed a very high veneration: this kind of shoe was called *stola*, *ada*, or *odo*. Caligula wore shoes enriched with precious stones. The Indians, like the Egyptians, wore shoes made of the bark of the papyrus. The Turks put off their shoes, and leave them at the doors of their mosques.

SHOE of an Anchor, a small block of wood, convex on the back, and having a small hole, sufficient to contain the point of the anchor-fluke, on the fore-side. It is used to prevent the anchor from tearing or wounding the planks on the ship's bow, when ascending or descending; for which purpose the shoe slides up and down along the bow, between the fluke of the anchor and the planks, as being pressed close to the latter by the weight of the former.

To SHOE an Anchor, is to cover the flukes with a broad triangular piece of plank, whose area or superficies.

Shoe.

hies is much larger than that of the flukes. It is intended to fasten the anchor a stronger and surer hold of the bottom in very soft and oozy ground.

Horse-Shoe, a plate of iron, of a certain form, nailed to the feet of horses, to defend and preserve the hoof.

As feet differ, so should shoes accordingly. "The only system of farriers, (Lord Pembroke observes), is to shoe in general with excessive heavy and clumsy ill-shaped shoes, and very many nails, to the total destruction of the foot. The cramps they annex, tend to destroy the bullet; and the shoes made in the shape of a walnut-shell prevent the horse's walking upon the firm basis which God has given him for that end, and thereby oblige him to stumble and fall. They totally pare away also and lay bare the inside of the animal's foot with their detestable butteris, and afterwards put on very long shoes, whereby the foot is hindered from having any pressure at all upon the heels, which pressure otherwise might still perchance, notwithstanding their dreadful cutting, keep the heels properly open, and the foot in good order. The frog should never be cut out; but as it will sometimes become ragged, it must be cleaned every now and then, and the ragged pieces pared off with a knife. In one kind of foot indeed a considerable cutting away must be allowed of, but not of the frog: we mean, that very high feet must be cut down to a proper height; because, if they were not, the frog, though not cut, would still be so far above the ground, as not to have any bearing on it, whereby the great tendon must inevitably be damaged, and consequently the horse would go lame.

"The weight of shoes must greatly depend on the quality and hardness of the iron. If the iron be very good, it will not bend; and in this case the shoes cannot possibly be made too light: care, however, must be taken, that they be of a thickness so as not to bend; for bending would force out the nails, and ruin the hoof. That part of the shoe which is next the horse's heel, must be narrower than any other, (as is seen in the draught, Plate CCLXVII. fig. 1.) that stones may be thereby prevented from getting under it, and sticking there: which otherwise would be the case; because the iron, when it advances inwardly beyond the bearing of the foot, forms a cavity, wherein stones being lodged would remain, and, by pressing against the foot, lame the horse. The part of the shoe which the horse walks upon should be quite flat, and the inside of it likewise; only just space enough being left next the foot, to put in a picker, (which ought to be used every time the horse comes into the stable), and also to prevent the shoe's pressing upon the sole. Four nails on each side hold better than a greater number, and keep the hoof in a far better state. The toe of the horse must be cut short, and nearly square, (the angles only just rounded off), nor must any nails be driven there; this method prevents much stumbling, especially in descents, and serves, by throwing nourishment to the heels, to strengthen them; on them the horse should in some measure walk, and the shoe be made of a proper length accordingly; by this means, narrow heels are prevented, and many other good effects produced. Many people drive a nail at the toe, but it is an absurd practice. Leaving room to drive one there causes the foot to be of an improper length; and moreover, that part of the hoof is naturally so brittle, that even when it is

Shoe

kept well greased, the nail there seldom stays in, but tears out and damages the hoof. That the directions for shoeing a proper length may be the more clear and intelligible, we have annexed (Plate CCLXVII.) a draught of a foot shod a proper length standing on a plain surface, and with it a draught of the right kind of shoe.

"In wet, spongy, and soft ground, where the foot sinks in, the pressure upon the heels is of course greater than on hard ground; and so indeed it should be upon all accounts. The hinder-feet must be treated in the same manner as the fore-ones; and the shoes the same: except in hilly and slippery countries, they may not improperly be turned up a little behind; but turning up the fore-shoes is of no service, and is certain ruin to the fore-legs, especially to the bullets. In descending hills, cramps are apt to throw horses down, by flopping the fore-legs, out of their proper basis and natural bearing, when the hinder ones are rapidly pressed; which unavoidably must be the case, and consequently cannot but push the horse upon his nose. With them on a plain surface, a horse's foot is always thrown forwards on the toe, out of its proper bearing, which is very liable to make the horse tumble. The notion of their utility in going up hills is a false one. In ascending, the toe is the first part of the foot which bears on, takes hold of the ground, and whether the horse draws or carries, consequently the business is done before the part where the cramps are comes to the ground. Ice-nails are preferable to anything to prevent slipping, as also to help horses up hill, the most forward ones taking hold of the ground early, considerably before the heels touch the ground: they must be so made, as to be, when driven in, scarce half an inch above the shoe, and also have four sides ending at the top in a point. They are of great service to prevent slipping on all kinds of places; and by means of them a horse is not thrown out of his proper basis. They must be made of very good iron; if they are not, the heads of them will be perpetually breaking off. From the race-horse to the cart-horse, the same system of shoeing should be observed. The size, thickness, and weight of them only should differ. The shoe of a race-horse must of course be lighter than that of a saddle-horse; that of a saddle-horse lighter than that of a coach or bat horse; and these last more so than a cart, waggon, or artillery horse. At present all shoes in general are too heavy; if the iron is good, shoes need not be so thick as they are now generally made.—The utmost severity ought to be inflicted upon all those who clap shoes on hot: this unpardonable laziness of farriers in making feet thus fit shoes, instead of shoes fitting feet, dries up the hoof, and utterly destroys them. Frequent removals of shoes are detrimental, and tear the foot; but sometimes they are very necessary: this is an inconvenience which half-shoes are liable to; for the end of the shoe, being very short, is apt to work loose into the foot, and consequently must then be moved."

In a late treatise on this subject by Mr Clark of Edinburgh, the common form of shoes, and method of shoeing, are, with great appearance of reason, totally condemned, and a new form and method recommended, which seem founded on rational principles, and to have been confirmed by experience.

Common method. "In preparing the foot for the shoe,

CCLXVII.

shoe, our author observes, the frog, the sole, and the bars or binders, are pared so much that the blood frequently appears. The shoe by its form (being thick on the inside of the rim, and thin upon the outside †), mult of consequence be made concave or hollow on that side which is placed immediately next the foot, in order to prevent its resting upon the sole. The shoes are generally of an immoderate weight and length, and every means is used to prevent the frog from resting upon the ground, by making the shoe-heels thick, broad, and strong, or raising cramps or caulkers on them.

“ From this form of the shoe, and from this method of treating the hoof, the frog is raised to a considerable height above the ground, the heels are deprived of that substance which was provided by nature to keep the crust extended at a proper wideness, and the foot is fixed as it were in a mould.

“ By the pressure from the weight of the body, and resistance from the outer edges of the shoe, the heels are forced together, and retain that shape impressed upon them, which it is impossible ever afterwards to remove; hence a contraction of the heels, and of course lameness. But farther,

“ The heels, as has been observed, being forced together, the crust presses upon the processes of the coffin and extremities of the nut-bone: The frog is confined, and raised so far from the ground, that it cannot have that support upon it which it ought to have: the circulation of the blood is impeded, and a wasting of the frog, and frequently of the whole foot, ensues. Hence proceed all those diseases of the feet, known by the names of *soured, hoof-bound, narrow-heels, running thrushes, corns, high soles, &c.*

“ I have likewise frequently observed, from this compression of the internal parts of the foot, a swelling of the legs immediately above the hoof, attended with great pain and inflammation, with a discharge of thin, ichorous, fetid matter: from which symptoms, it is often concluded, that the horse is in a bad habit of body, (or what is termed a *grease falling down*), and must therefore undergo a course of medicine, &c.

“ The bad effects of this practice are still more obvious upon the external parts of the hoof. The crust toward the toe, being the only part of the hoof free from compression, enjoys a free circulation of that fluid necessary for its nourishment, and grows broader and longer; from which extraordinary length of toe, the horse stumbles in his going, and cuts his legs. The smaller particles of sand insinuate themselves between the shoe and the heels, which grind them away, and thereby produce lameness. All this is entirely owing to the great spring the heels of the horse must unavoidably have upon the heels of a shoe made in this form.

“ This concave shoe in time wears thin at the toe, and, yielding to the pressure made upon it, is forced wider, and of consequence breaks off all that part of the crust on the outside of the nails. Instances of this kind daily occur, inasmuch that there hardly remains crust sufficient to fix a shoe upon.

“ It is generally thought, that the broader a shoe is, and the more it covers the sole and frog, a horse will travel the better. But, as has been formerly remarked, the broader a shoe is of this form, it must be

made the more concave; and, of consequence, the Shoeing of contracting power upon the heels must be the greater. Horses. It is likewise to be observed, that, by using strong broad-rimmed concave shoes in the summer-season, when the weather is hot and the roads very dry and hard, if a horse is obliged to ride fast, the shoes, by repeated strokes (or friction) against the ground, acquire a great degree of heat, which is communicated to the internal parts of the foot; and, together with the contraction upon the heels occasioned by the form of the shoe, must certainly cause exquisite pain. This is frequently succeeded by a violent inflammation in the internal parts of the hoof, and is the cause of that disease in the feet so fatal to the very best of our horses, commonly termed a *founder*. This is also the reason why horses, after a journey or a hard ride, are observed to shift their feet so frequently, and to lie down much.

“ If we attend further to the convex surface of this shoe, and the convexity of the pavement upon which horses walk, it will then be evident, that it is impossible for them to keep their feet from slipping in this form of shoe, especially upon declivities of freets.

“ It is also a common practice, especially in this place, to turn up the heels of the shoes into what is called *cramps* or *caulkers*, by which means the weight of the horse is confined to a very narrow surface, viz. the inner round edge of the shoe-rim and the points or caulkers of each heel, which soon wear round and blunt; besides, they for the most part are made by far too thick and long. The consequence is, that it throws the horse forward upon the toes, and is apt to make him slip and stumble. To this cause we must likewise ascribe the frequent and sudden lameness horses are subjected to in the legs, by twisting the ligaments of the joints, tendons, &c.

“ I do not affirm, that caulkers are always hurtful, and ought to be laid aside: On the contrary, I grant, that they, or some such like contrivance, are extremely necessary, and may be used with advantage upon flat shoes where the ground is slippery; but they should be made thinner and sharper than those commonly used, so as to sink into the ground, otherwise they will rather be hurtful than of any advantage.

“ The Chinese are said to account a small foot an ornament in their women, and for that purpose, when young, their feet are confined in small shoes. This no doubt produces the desired effect; but must necessarily be very prejudicial to them in walking, and apt to render them entirely lame.

“ This practice, however, very much resembles our manner of shoeing horses: for, if we looked upon it as an advantage to them to have long feet, with narrow low heels, and supposing we observed no inconvenience to attend it, or bad consequence to follow it, we could not possibly use a more effectual means to bring it about, than by following the method already described.

“ In shoeing a horse, therefore, we should in this, as in every other case, study to follow nature: and certainly that shoe which is made of such a form as to resemble as near as possible the natural tread and shape of the foot, must be preferable to any other.

“ But it is extremely difficult to lay down fixed rules with respect to the proper method to be observed

Shoeing of
Horses.

ved in treating the hoofs of different horses: it is equally difficult to lay down any certain rule for determining the precise form to be given their shoes. This will be obvious to every judicious practitioner, from the various constructions of their feet, from disease, and from other causes that may occur; so that a great deal must depend upon the discretion and judgment of the operator, in proportioning the shoe to the foot, by imitating the natural tread, to prevent the hoof from contracting a bad shape.

"In order, therefore, to give some general idea of what may be thought most necessary in this matter, I shall endeavour to describe that form of shoe and method of treating the hoofs of horses, which from experience I have found most beneficial.

"*Proper Method.* It is to be remembered, that a horse's shoe ought by no means to rest upon the sole, otherwise it will occasion lameness; therefore it must rest entirely on the crust; and, in order that we may imitate the natural tread of the foot, the shoe must be made flat, (if the height of the sole does not forbid it); it must be of an equal thickness all around the outside of the rim (A); and on that part of it which is to be placed immediately next the foot, a narrow rim or margin is to be formed, not exceeding the breadth of the crust upon which it is to rest, with the nail-holes placed exactly in the middle; and from this narrow rim the shoe is to be made gradually thinner towards its inner edge. See fig. 5.

"The breadth of the shoe is to be regulated by the size of the foot, and the work to which the horse is accustomed: but, in general, it should be made rather broad at the toe, and narrow towards the extremity of each heel, in order to let the frog rest with freedom upon the ground. The necessity of this has been already shown.

"The shoe being thus formed and shaped like the foot, the surface of the crust is to be made smooth, and the shoe fixed on with eight or at most ten nails, the heads of which should be sunk into the holes, so as to be equal with the surface of the shoe. The sole, frog, and bars, as I have already observed, should never be pared, farther than taking off what is ragged from the frog, and any excrescences or inequalities from the sole. And it is very properly remarked by Mr Omer, "That the shoe should be made so as to stand a little wider at the extremity of each heel, than the foot itself: otherwise, as the foot grows in length, the heel of the shoe in a short time gets within the heel of the horse; which pressure often breaks the crust, and produces a temporary lameness, perhaps a corn."

"This method of shoeing horses I have followed long before Mr Omer's treatise on that subject was published; and for these several years past I have endeavoured to introduce it into practice.

"But so much are farriers, grooms, &c. prejudiced in favour of the common method of shoeing and paring out the feet, that it is with difficulty they can even be prevailed upon to make a proper trial of it.

"They cannot be satisfied unless the frog be finely shaped, the sole pared, and the bars cut out, in order to make the heels appear wide (B). This practice gives them a show of wideness for the time; yet that, toge-

ther with the concave form of the shoe, forwards the contraction of the heels, which, when confirmed, renders the animal lame for life.

"In this flat form of shoe, its thickest part is upon the outside of the rim, where it is most exposed to be worn; and being made gradually thinner towards its inner edge, it is therefore much lighter than the common concave shoe: yet it will last equally as long, and with more advantage to the hoof; and as the frog or heel is allowed to rest upon the ground, the foot enjoys the same points of support as in its natural state. It must therefore be much easier for the horse in this way of going, and be a means of making him surer-footed. It is likewise evident, that, from this shoe, the hoof cannot acquire any bad form; when, at the same time, it receives every advantage that possibly could be expected from shoeing. In this respect it may very properly be said, that we make the shoe to the foot, and not the foot to the shoe, as is but too much the case in the concave shoes, where the foot very much resembles that of a cat's fixed into a walnut shell.

"It is to be observed, that the hoofs of young horses, before they are shod, for the most part are wide and open at the heels, and that the crust is sufficiently thick and strong to admit of the nails being fixed very near the extremities of each. But, as I have formerly remarked, from the constant use of concave shoes, the crust of this part of the foot grows thinner and weaker; and when the nails are fixed too far back, especially upon the inside, the horse becomes lame: to avoid this, they are placed more towards the fore-part of the hoof. This causes the heels of the horse to have the greater spring upon the heels of the shoe, which is so very detrimental as to occasion lameness; whereas, by using this flat form of shoe, all these inconveniences are avoided; and if the hoofs of young horses, from the first time that they were shod, were continued to be constantly treated according to the method here recommended, the heels would always retain their natural strength and shape.

"By following this flat method of shoeing, and manner of treating the hoofs, several horses now under my care, that were formerly tender-footed, and frequently lame, while shod with broad concave shoes, are now quite sound, and their hoofs in as good condition as when the first shoes were put upon them: In particular, the horse that wore the broad concave shoes, from which the drawings of fig. 2. and 3. were taken, now goes perfectly sound in the open narrow kind of shoes, as represented fig. 4. 5.

"If farriers considered attentively the design of shoeing horses, and would take pains to make themselves acquainted with the anatomical structure of the foot, they would then be convinced, that this method of treating the hoofs, and that this form of shoe, is preferable to that which is so generally practised.

"It has been alleged, that in this form of shoe horses do not go so well as in that commonly used. This objection will easily be laid aside, by attending to the following particulars. There are but few practitioners that can or will endeavour to make this sort of shoe as it ought to be. The iron, in forming it, does

(A) For a draught-horse about half an-inch thick, and larger in proportion for a saddle-horse.

(B) Wide open heels are looked upon as a mark of a sound good hoof.

Shoeing of does not so easily turn into the circular shape necessary as in the common shoe; and perhaps this is the principal reason why farriers object to it, especially where they work much by the piece. And as many horses that are commonly shod with concave shoes have their soles considerably higher than the crust, if the shoe is not properly formed, or if it is made too flat, it must unavoidably rest upon the sole, and occasion lameness.

"The practice of paring the sole and frog is also so prevalent, and thought to be absolutely necessary, that it is indiscriminately practised, even to excess, on all kinds of feet: And while this method continues to be followed, it cannot be expected that horses can go upon hard ground (on this open shoe) with that freedom they would do if their soles and frogs were allowed to remain in their full natural strength.

"Experience teaches us, that, in very thin-soled shoes, we feel an acute pain from every sharp-pointed stone we happen to tread upon. Horses are sensible of the same thing in their feet, when their soles, &c. are pared too thin. Hence they who are prejudiced against this method, without ever reflecting upon the thin state of the sole, &c. are apt to condemn it, and draw their conclusions more from outward appearances than from any reasoning or knowledge of the structure of the parts. From a due attention likewise to the structure of a horse's foot in a natural state, it will be obvious, that paring away the sole, frog, &c. must be hurtful, and in reality is destroying that substance provided by nature for the defence of the internal parts of the foot: From such practice it must be more liable to accidents from hard bodies, such as sharp stones, nails, glass, &c. From this consideration, we will likewise find, that a narrow piece of iron, adapted to the shape and size of the foot, is the only thing necessary to protect the crust from breaking or wearing away; the sole, &c. requiring no defence if never pared.

"There is one observation I would farther make, which is, that the shoe should be made of good iron, well worked, or what smiths call hammer-hardened, that is, beat all over lightly with a hammer when almost cold. The Spaniards and Portuguese farriers use this practice greatly, inasmuch that many people, who have seen them at work, have reported, that they form their horses' shoes without heating them in the fire as we do. It is well known, that heating of iron till it is red softens it greatly; and when shoes thus softened are put upon horses' feet, they wear away like lead. But when the shoes are well hammered, the iron becomes more compact, firm, and hard; so that a well-hammered shoe, though made considerably lighter, yet will last as long as one that is made heavier; the advantage of which is obvious, as the horse will move his feet with more activity, and be in less danger of cutting his legs.

"The common concave shoes are very faulty in this respect; for, in fitting or shaping them to the foot, they require to be frequently heated, in order to make them bend to the unequal surface which the hoof acquires from the constant use of these shoes: they thereby become soft; and to attempt to harden them by beating or hammering when they are shaped to the foot, would undo the whole. But flat shoes, by making them, when heated, a little narrower than the foot, will, by means of hammering, become wider, and acquire a degree of elasticity and firmness which

it is necessary they should have, but impossible to be given them by any other means whatever; so that any farrier, from practice, will soon be able to judge, from the quality of the iron, how much a shoe, in fitting it to the circumference of the hoof, will stretch by hammering when it is almost cold: this operation, in fitting flat shoes, will be the less difficult, especially when it is considered, that as there are no inequalities on the surface of the hoof (or at least ought not to be) which require to be bended thereto, shoes of this kind only require to be made smooth and flat; hence they will press equally upon the circumference or crust of the hoof, which is the natural tread of a horse."

SHOOTING, in the military art. See **ARTILLERY**, **GUNNERY**, and **PROJECTILES**.

SHOOTING, in sportsmanship, the killing of game by the gun, with or without the help of dogs.

Whether the game be flying, or on a hedge or tree, always endeavour to shoot as near as you possibly can with the wind, and rather sidewise or behind the fowl than in their face; nor shoot at a single bird, if you can compass more within your level. If they be on a tree, hedge, or the ground, seek out for the most convenient shelter you can, of a hedge, bank, tree, &c. that you may be concealed from the sight of the fowl; and being within shot, and having a fair mark, lose no time, but let fly.

If dogs are used, we put them on the hunt by whistling or hying-on (as the term is): it is necessary to observe the motions of spaniels, for there are but few that will not give some intimation when they come on scent; use them to come in at a sharp call, and never suffer them to run after a bird, except it is wounded: observe to let the dogs, whether spaniels or pointers, have the wind as much as possible, (that is, let them hunt against the wind).

In using pointers, when they are observed drawing on a point, and are known to be not quite staunch, call to them to take heed; and if they spring without standing, correct them slightly with a switch, speaking angrily to them, and keep them at a distance the remaining part of the day; unless their after-behaviour deserve encouragement, when it may not be improper to take them into favour.

Shooting flying, is by experience found to be the best and most diverting way of shooting. It is necessary for any gentleman who sports much to have two guns; the barrel of one about two feet nine inches, which will serve very well for the beginning of the season, and for wood-shooting; the other about three feet three inches, for open-shooting after Michaelmas: the birds by that time are grown so shy, that your shots must be at longer distances. But if you intend one gun to serve for all purposes, then a three-foot barrel, or thereabouts, is most proper. You should always have it cocked in readiness; holding your thumb over the cock, lest it should go off when you would not have it.

It is generally accounted the best way to aim at the head, if the game flies over your head; but to aim as it were under the belly, if it flies from you; and it will be best to let the game fly a little past you before you let fly, for by so doing the shot will the better enter the body. Shot delivered from a gun in general lose or decrease half the quantity every ten yards or thereabouts; so that at forty yards there will not be thrown in above a fourth of what would be into the

Shooting.

Shooting.

same space at twenty yards. From which it appears, that if you take aim a foot before a cross-shot at forty yards, you will be the most likely to meet the bird with the centre-shot; and which is looked upon to fly the strongest, and to be more efficacious at long distances, than the diverging shot: for whether it be the shot striking against each other, or against the air, at first coming out of the muzzle, or whatever be the cause of their diverging, it must in some degree retard their motion. But if there be a brisk wind, it will certainly bend the course of the shot; you must therefore consider whether the wind blows with the bird or against it: if it blow with it, you need little more than to observe the general rule, because the wind helps the bird forward nearly as much as it diverts the shot; but if it fly against the wind, the shot will decline more than the bird is retarded, and therefore you ought to take aim at a greater distance before the bird.

One good pointer in the field at a time, if you have patience to attend him, will be sufficient for two men to shoot with; but if you have an old springing spaniel, that is so well under command that you can always keep him near you, such a dog may be used with your pointer with great advantage; as he will better find birds that are wounded, and also spring such as are near you, which you otherwise might pass. But if you should be fond of hunting many pointers together in a field, as is frequently done, you should not have more than one amongst them, who has been taught to fetch his game, left, by endeavouring to get it from each other, they should tear it.

Partridge-Shooting. The season for this sport begins, by act of parliament, on the 1st of September, and ends the 12th of February; and which, on account of the cleanness, little fatigue, and more certain diversion than any other, by their being found in coverts, and taking short flights, is generally esteemed the gentlest and best sport we have.—In the beginning of the season, they haunt the wheat, barley, oat, pease and bean-stubbles; but the wheat-vech is their favourite: they also lie in turnips, clover-feed, and on fallow-land; and indeed, at times, they are found any where.

The most proper dog for partridge-shooting, is the pointer, a dog extremely well calculated for the sport; as partridges can seldom or ever be seen on the ground, if the stubble, &c. be but three or four inches high: if the pointer be staunch, and have a good nose, he will seldom pass, in common fields, within 40 yards of a covert, without intimating by a point pretty near the exact line they lie in.

Two persons in the field with guns are better than more at partridge shooting, who should with patience pay a due attention to each other.

Observe, after a fire, never to blow through the barrel, but charge again immediately, while the inside of the barrel is hot and dry; by this method of immediate charging, a gun seldom hangs fire, and carries much smarter and better: there is no occasion to wipe either pan or flint while out, (if the flint is good, which, by the bye, it always should be); but on returning home, wipe clean with tow, or linen-rags, both out and inside of the barrel, and also the lock, from the soil of the powder; when it is thus cleaned,

hang it up, and, if it can be so ordered, where a constant winter fire is kept, hanging it at a moderate distance from the fire: the powder-flask should also be kept in the same degree of warmth in winter-time; if the gun has received any rain or wet, let it be wiped thoroughly dry, and stand some time near a fire, to dry any remaining damp, and have a little oil rubbed over it before hanging up.

When your dog points, walk up without any hurry, separating a few yards, one to the right and the other to the left of your dog: if a covert springs, never shoot into the midst of them, but let him on the left single out a bird which flies to the left, and him on the right a bird to the right, that you may not interrupt each other nor both shoot at the same bird, and readily let fly at the first aim. Let each of you mark the fall of his bird, and immediately run to the place; and if the dog does not secure it, or the bird should be only wounded and have run, put him upon the scent; but if your dog understands his business, and will fetch his game, it is better to trust to him, and load again as quick as you can. It will always be of great use, and save much time and trouble, to have a person without a gun to mark the flight of the birds. If a single bird be sprung, let him take the shoot to whose side it flies: the bird being killed, cause your dog to lie by it whilst you load, lest he spring other birds that are near you.

If you trace the birds to a hedge, double the row by walking one on each side, taking your dog on the ditch side: here if you have a spaniel, he will be of great use; as you may make him go along in the ditch, and your pointer on the other side; by which means you will not pass a bird, and one of you will most likely get a good shoot at it. Your own judgment, with very little experience, will best direct where the birds are most likely to be found at different times of the day, according to the grounds you have to hunt in.

Pheasant and Woodcock Shooting. Pheasants and woodcocks generally lie in carrs or woods where there is much cover. Spaniels are therefore the dogs most proper for this kind of shooting. Some pointers indeed, that are bold-spirited and have been a great deal used to this work, will follow a pheasant very well; but from the generality of slow staunch pointers a pheasant will get off so fast, as, when sprung, to be out of the reach of gun-shot; besides, they are not hardy enough to go into thick cover.

The spaniels proper for this work are of a middling size, their legs rather short and very strong: they must be hardy, able to bear great fatigue, disposed to go into cover freely and undaunted, to hunt very briskly, and yet go very slow when upon scent of game. You cannot begin too early with these dogs to teach them to fetch a bird and bring it after you: which will prevent their getting a habit of tearing or breaking the game. One of this kind must be always obliged to lie down whilst you load: and as his business is to spring game, you should never suffer him to go above ten or fifteen yards from you; and therefore take him out with others that are brought under command as soon as he is able to hunt. For to have good spaniels, they must be used a great deal. If you find any difficulty in keeping him to hunt near

you,

Shooting. you, put one of his feet into his collar, and hunt him so for an hour or two. Frequent repetitions of this punishment will bring him to a sense of his duty. One, two, or three brace of spaniels well broken, may be used together; and they will find work enough in a large wood or thick cover. If two persons intend hunting in a wood, it is best for one to go round it on the outside first, whilst the other goes opposite to him a little way into the wood, and afterwards to sink in deeper as you shall find occasion, unless you know the most likely part to find game in; in which case you may hunt the interior part first. Some persons, when they want to hunt a very large wood, approve of taking a brace of high-mettled spaniels that have not been broken, to hunt close, and turn them into the middle of the wood; whilst they with their well-broken spaniels hunt outwards. But unless you have any extensive woods to hunt, such dogs are more likely to hinder than add to your sport; and it will be better to hunt with patience with only such dogs as are under good command, let the woods or cover be ever so large.

1. Pheasant-Shooting begins, by act of parliament, on the 1st of October, and lasts till the 1st of February.

These birds afford very pretty sport, though far more fatiguing and tiresome than partridge-shooting; owing to the bushes, briars, and other disagreeable circumstances of the woods.—In hunting them, keep as near the dogs as possible; and when they spring, one or more, let such only fire at the bird as to whom, in point of rising, it belongs; which rule should be always observed in all sorts of shooting in company. In pheasant-shooting, the trees frequently interfere, therefore forbear firing till you have a clear aim at the bird; which, if it cannot be had, it is better to let him escape for another chance.

2. Woodcock Shooting generally begins towards the latter end of November; they are birds of passage, and come over to us in flights in the night-time, about the full of the moon: the first flight, which is sometimes in October, is commonly very scanty; but they continue coming over, more or less, every moon, till February; consequently it will generally be found they are in greater plenty towards the latter end of the winter; though this is no absolute rule, as they are very irregular with regard to number in their coming over; sometimes the first or second flight being the largest we have through the winter, and the others very trifling; they remain with us generally till the middle or latter end of March.

Their haunts are chiefly in the springs and bogs, in woods and coppices; and in the beginning of the winter, before the leaves are well off, they prefer the out-parts of the woods. For springing them, therefore, spaniels are used, as already mentioned.

A woodcock is a very tender bird; and being a large mark, affords easy, pretty shooting, where a person has got the art of shooting flying tolerably well; but it frequently occurs that the bird rises in a perpendicular line, which is the most difficult shot that is. In this case, an experienced sportsman will find it more advisable to forbear firing (if opportunity will allow) till the bird has arrived at the height of the perpendicular, and flies offward; but as a shot will be often lost

by this delay, the good marksman should never wait it, except he judges the shot will be better.

Snipe-Shooting. The snipe, like the woodcock, is a bird of passage; they begin coming over to us about the middle or latter end of October, and remain with us pretty forward in the spring. They frequent, like the woodcock, the springs, bogs, and marshy places; but with this difference, that the cock seeks these in cover, and the snipe in the open clear parts, as fields and common.

Snipes afford as pretty sport, to a good marksman, as any bird whatsoever; though they are very quick fliers, yet are very tender, and will fall almost at the bare report of the gun.

We spring snipes either with spaniels, or by making a slight sharp kind of noise about the places where we know they haunt: they mostly fly directly against the wind, (if there is any material air stirring), and a shot after them is the best and most sure: the shot and cross shots are rather difficult, as they are a small mark, and fly exceeding quick.—For practice in this, which is very nice, swallow-shooting may be used in summer to advantage.

Of Water-fowl Shooting. In shooting water-fowl, as geese, ducks, widgeons, &c. we use the longest killing gun, and as large shot as the n^o 1 or 2.

The proper dog is the rough, curled, water spaniel, of which the white sort are commonly the best. They should be under the strictest command; be ready at fetching any thing out of the water, without biting it; and catching what is only wounded; should be used, on occasion, to creep quiet and close behind the master's heel.

The fowl may either be shot swimming, or, which is better, taken on the wing; as in the water they are strongly guarded by the close lying of their wings and feathers; therefore, if a person is a good marksman, it will be always best to spring them first.

The best place to throw the shot, if opportunity will allow, is under the wing, as that is by much the tenderest place; and the worse of all is the breast, as the feathers here lie extremely thick and close.

Fen Shooting. In this sport we use in general the n^o 3 shot, which will serve as well for the bittern and curlew, as the plover. One or two steady water or land spaniels may be used; and it will be always best to spring the birds before firing.

Upland Winter Shooting. Our common field-shooting is generally best in frosty weather, and when the ground has a tolerable cover of snow. The most common birds in this sport are, different sorts of wild pigeons, fieldfares, starlings, redwings, &c. In this diversion we use no dog; and the fewer shooters together the better.

The several kinds of pigeons require the n^o 3 shot, as being strong birds; and may be either taken on the wing, or as they perch on a tree; but the rock-pigeons are best, in general, taken on the wing; however, it sometimes happens that a shot at them sitting is more proper; in this discretion must direct.

The fieldfare is a very common bird: it seems to delight most in large close orchards; but in hard weather, in the fields; they frequent the haw bushes, and afford very pretty diversion. Though they are naturally very wild, yet, when a hard frost is set in, there

Shooting.

Shooting
Shore.

is no difficulty in getting within 40 yards of them, at the time they are keenly engaged on their feeding bush: here they will sit 40 or 50 sometimes together. The proper way of managing this kind of shooting is, if possible, to secrete behind a bush, or in a hedge, within shot of one of the bushes they frequent: when a sufficient number (as the person may judge) are together, to fire at them as they sit; what are killed should be taken up, and the shooter replace himself as before: in a quarter of an hour, or less, more will probably be on the bushes; and he may often go on shooting in the same place all the while they are on their feed, which is from a little after sun-rise till 11 or 12 o'clock; and in the afternoon they go on again, about an hour before sun-set; but such sport as this must be expected only where fields are in great plenty.

Starlings afford tolerable diversion in shooting. In winter they, for the most part, go in flocks from 20 to 50; they delight chiefly to be in moist pastures among cattle, and sometimes sit so close together on the ground, that a person may kill 25 or 30 at a shot. Taking these on the ground, or wing, may be left at the discretion of the shooter; but the wing will be best preferred: what are shot, should have their heads immediately pulled off, which, by their bleeding, prevents a bitterness of taste they would otherwise have. Use for these and fieldfares the n° 4 shot.—In shooting *larks* in flocks, use the n° 5 shot; and make it a rule always to take them on the wing. Here it will be advisable to have the gun scatter more than common: And in order to do this, put in an equal quantity of shot, supposing the usual charge to be three parts shot to two of powder; but if the gun, in common, carries an equal quantity of each, then it will be necessary to put in only about three parts of shot to four of powder: and in shooting any of the smaller birds in flocks, this rule of charging should be observed.

SHOP-LIFTERS, are those that steal goods privately out of shops; which being to the value of 5s. though no person be in the shop, is felony excluded clergy, by the 10 and 11 W. III. c. 23.

SHORE, a place washed by the sea, or by some large river.

Count Marigli divides the sea-shore into three portions: the first of which is that track of land which the sea just reaches in storms and high tides, but which it never covers; the second part of the shore, is that which is covered in high tides and storms, but is dry at other times; and the third is the descent from this, which is always covered with water. See SEA.

The first part is only a continuation of the continent, and suffers no alteration from the neighbourhood of the sea, except that it is rendered fit for the growth of some plants, and wholly unfit for that of others, by the saline steams and impregnations: and it is scarce to be conceived by any, but those who have observed it, how far on land the effects of the sea reach, so as to make the earth proper for plants which will not grow without this influence; there being several plants frequently found on high hills and dry places, at three, four, and more miles from the sea, which yet would not grow unless in the neighbourhood of it, nor will ever be found elsewhere.

The second part or portion of the shore is much more affected by the sea than the former, being fre-

quently washed and beaten by it. Its productions are rendered salt by the water, and is covered with sand, or with the fragments of shells in form of sand, and in some places with a tartarous matter deposited from the water; the colour of this whole extent of ground is usually dusky and dull, especially where there are rocks and stones, and these covered with a slimy matter.

The third part of the shore is more affected by the sea than either of the others; and is covered with an uniform crust of the true nature of the bottom of the sea, except that plants and animals have their residence in it, and the decayed parts of these alter it a little.

SHORE (Jane), the celebrated concubine of the licentious king Edward IV. was the wife of Mr Matthew Shore, a goldsmith in Lombard-street, London. Kings are seldom unsuccessful in their amorous pursuits; therefore there was nothing wonderful in Mrs Shore's removing from Lombard-street to shine at court as the royal favourite. Historians represent her as extremely beautiful, remarkably cheerful, and of most uncommon generosity. The king, it is said, was no less captivated with her temper than with her person: she never made use of her influence over him to the prejudice of any person; and if ever she importuned him, it was in favour of the unfortunate. After the death of Edward, she attached herself to the lord Hastings; and when Richard III. cut off that nobleman as an obstacle to his ambitious schemes, Jane Shore was arrested as an accomplice, on the ridiculous accusation of witchcraft. This, however, terminated only in a public penance; excepting that Richard rifled her of all her little property: but whatever severity might have been exercised towards her, it appears that she was alive, though sufficiently wretched, under the reign of Henry VIII. when Sir Thomas More saw her poor, old, and shrivelled, without the least trace of her former beauty. Mr Rowe, in his tragedy of Jane Shore, has adopted the popular story related in the old historical ballad, of her perishing by hunger in a ditch where Shoreditch now stands. But Stow assures us that street was so named before her time.

SHORLING and MORLING, are words to distinguish fells of sheep; *shorling* being the fells after the fleeces are shorn off the sheep's back; and *morling*, the fells shorn off after they die or are killed. In some parts of England they understand by a *shorling*, a sheep whose face is shorn off; and by a *morling*, a sheep that dies.

SHORT-HAND Writing. See STENOGRAPHY.

SHORT-SIGHTEDNESS, a certain defect in vision, by which objects cannot be distinctly seen unless they are very near the eye. See MEDICINE, n° 179. and OPTICS, n° 123.

SHOT, a denomination given to all sorts of balls for fire-arms; those for cannon being of iron, and those for guns, pistols, &c. of lead.

Small SHOT, or that used for fowling, should be well sized, and of a moderate bigness: for should it be too great, then it lies thin, and scatters too much; or if too small, then it hath not weight and strength to penetrate far, and the bird is apt to fly away with it. In order, therefore, to have it suitable to the occasion, it not being always to be had every place fit for the purpose, we shall set down the true method of making

Shore
Shot.

Shot.

all sorts and sizes under the name of mould-shot. Its principal good properties are to be round and solid.

Take any quantity of lead you think fit, and melt it down in an iron vessel; and as it melts keep it stirring with an iron ladle, skimming off all impurities whatsoever that may arise at the top: when it begins to look of a greenish colour, strew on it as much auripigmentum, or yellow orpiment finely powdered, as will lie on a shilling, to every 12 or 14 pound of lead; then stirring them together, the orpiment will flame.

The ladle should have a notch on one side of the brim, for the easier pouring out the lead; the ladle must remain in the melted lead, that its heat may be agreeable to that of the lead, to prevent inconveniences which otherwise may happen by its being either too hot or too cold: then, to try your lead, drop a little of it into the water, which if the drops prove round, then the temper of heat is right; if otherwise, and the shot have tails, then add more orpiment to increase the heat, till it be found right.

Then take a plate of copper, about the bigness of a trencher, which must be made with a hollowness in the middle, about three inches compass, within which must be bored about 40 holes according to the size of the shot which you intend to cast: the hollow bottom should be thin; but the thicker the brim, the better it will retain the heat. Place this plate on a frame of iron, over a tub or vessel of water, about four inches from the water, and spread burning coals on the plate, to keep the lead melted upon it: then take some lead and pour it gently on the coals on the plate, and it will make its way through the holes into the water, and form itself into shot; do thus till all your lead be run through the holes of the plate, taking care, by keeping your coals alive, that the lead do not cool, and so stop up the holes.

While you are casting in this manner, another person with another ladle may catch some of the shot, placing the ladle four or five inches underneath the plate in the water, by which means you will see if they are defective, and rectify them.

Your chief care is to keep the lead in a just degree of heat, that it be not so cold as to stop up the holes in your plate, nor so hot as to cause the shot to crack: to remedy the heat, you must refrain working till it is of a proper coolness; and to remedy the coolness of your lead and plate, you must blow your fire; observing, that the cooler your lead is, the larger will be your shot; as the hotter it is, the smaller they will be.

After you have done casting, take them out of the water, and dry them over the fire with a gentle heat, stirring them continually that they do not melt; when dry, you are to separate the great shot from the small, by the help of a sieve made for that purpose, according to their several sizes. But those who would have very large shot, make the lead trickle with a stick out of the ladle into the water, without the plate.

If it stop on the plate, and yet the plate be not too cool, give but the plate a little knock, and it will run again; care must be had that none of your implements be greasy, oily, or the like; and when the shot, being separated, are found too large or too small for your purpose, or otherwise imperfect, they will serve again at the next operation.

The sizes of shot for fowling are from N^o 1 to 6, and

smaller, which is called *mustard-seed*, or *dust-shot*; but N^o 5 is small enough for any shooting whatsoever. The N^o 1 may be used for wild-geese; the N^o 2 for ducks, widgeons, and other water-fowl; the N^o 3 for pheasants, partridges after the first month, and all the fowls; the N^o 4 for partridges, woodcocks, &c.; and the N^o 5 for snipes and all the smaller birds.

Grape-Shot. See *GRAPE-Shot*.

Tin-cape Shot, in artillery, is formed by putting a great quantity of small iron shot into a cylindrical tin-box called a *cannister*, that just fits the bore of the gun. Leaden bullets are sometimes used in the same manner; and it must be observed, that whatever number or sizes of the shots are used, they must weigh within their cases nearly as much as the shot of the piece.

Cape Shot, formerly consisted of all kinds of old iron, nails, musket-balls, stones, &c. used as above.

SHOVEL (Sir Cloudefley), a brave English admiral, mealy born in 1650. He went to sea a cabin-boy under Sir Christopher Mynus; and soon becoming an able seaman, distinguished himself by his courage and conduct at Tripoli under Sir John Narborough, whose widow he afterward married. King William knighted, and made him an admiral. He had a great share of the glory in the battles of Bantry bay, La Hogue, Malaga, and at the siege of Barcelona. After the unsuccessful attempt upon Toulon, he was cast away on his return home, upon the rocks of Scilly; being then rear-admiral of England, admiral of the white, commander in chief of the queen's fleet, and one of the council to prince George of Denmark as lord high-admiral of England.

SHOVELER, in ornithology, a species of *ANAS*.

SHOWER, in meteorology, a cloud condensed into RAIN.

SHREWMOUSE. See *SOREX*.

SHREWSBURY, the capital of Shropshire in England. This town, the metropolis of the county, grew up out of the ruins of Uriconium, anciently a city, now a village called *Wroxeter* about four miles from it. The Saxons called it *Scribber Berig*, from the shrubs that grew about it; and from thence the present name of *Shrewsbury* is supposed to have been formed. It is pleasantly situated upon a hill near the Severn, over which there are two handsome bridges. It was a place of good note in the Saxon times; after which it was granted by William the Conqueror, together with the title of *earl* and most of the county, to Roger de Montgomery, who built a castle upon the north side of it, where the Severn, that encompasses it on all sides, leaves an opening. His son Robert built also a wall across this neck of land, when he revolted from Henry I. We learn from doomday book, that at that time, when a widow of this town married, she paid 20 shillings to the king, and a virgin 10. The abovementioned Roger founded also, and endowed here, a Benedictine monastery, and a collegiate church. When old age came upon him, he quitted the world, and spent the rest of his days as a monk in the abbey, and, when he died, was interred in its church. From the history of this church and monastery, it appears, that ecclesiastical benefices about that time were hereditary. The abbey became so rich afterwards, that the abbot was mitred, and sat in parliament. Besides this abbey, in after-times there were three others, viz.

Shot
Shrewsbury

Shrewsbury a Franciscan, Dominican, and Augustin, and likewise two collegiate churches; one dedicated to St Chad, and the other to St Mary. In the contest between the empress Maud and Stephen, this town, and its governor William Fitz-Allan, sided with the empress. In Henry III.'s time, a part of it was burnt down by the Welch; and in Richard II.'s reign a parliament was held in it. At a place called *Battlefield*, near this town, Henry Percy the younger, surnamed *Hotspur*, was killed in an engagement with Henry IV. against whom he had rebelled. The king afterwards built a chapel upon the spot, and settled two monks-priests to pray for the souls of the slain. Two of Edward IV.'s sons were born here; namely, Richard, styled *duke of York*, whom Perkin Warbeck afterwards personated, and who was murdered in the Tower; and George Plantagenet, who died before his brothers. Here first broke out the sweating-sickness, which carried off great numbers so suddenly, that those who were seized with it either died or recovered in the space of 24 hours. In the beginning of the civil wars king Charles I. came hither, and formed an army, with which he marched towards London; but was met by the parliament's forces at Edgehill. He continued here from the 20th of September to the 12th of October; during which time he was joined by prince Rupert, and many of the gentry and nobility of these parts. This town anciently gave title of *earl* to the Montgomeries, and afterwards to the Talbots, by whom it is still retained. Here is a free grammar-school, with three masters, and several others, well endowed by Edward VI. and queen Elizabeth, and not inferior to many colleges in the universities. It has a good library and chapel, and there are several scholarships appropriated to it in the university of Cambridge. Here are also several hospitals, almshouses, and charity-schools. This town is one of the most flourishing in England, having two great weekly markets, for corn, cattle, and provisions; and another for Welch cottons and flannels, of which great quantities are sold. A great trade is carried on with the Welch, who bring their commodities hither, as to the common mart of both nations. The town is large and well built, and the situation extremely pleasant. There is a very beautiful walk called the *quarry*, between the town-walls and the Severn, delightfully shaded with rows of lime-trees, so that it is not inferior to the Mall in St James's Park. The town is also noted for its gallantry and politeness, being full of gentry, and for whom there are always balls and assemblies once a week all the year round. Here is a fine house and gardens which belonged to the earl of Bradford; and in the neighbourhood, at Wroxeter, the Roman highway, called *Watling-street*, may be seen for several miles, where Roman coins are frequently found. In Shrewsbury are 12 incorporated trading-companies; and the corporation has a power to try even capital causes of itself, except high-treason. Thigh-bones of dead men have been found here a yard long, and teeth three inches round and three long.

SHREWSBURY (earl of). See TALBOT.

SHRIKE, a species of LANIUS.

SHRIMP, in ichthyology. See SQUILLA.

SHRINE, in ecclesiastical history, a case or box to hold the relics of some saint.

SHROPSHIRE, a county of England, bounded on the south by Worcestershire, Herefordshire, and Radnorshire; on the north, by Cheshire; on the east, by Staffordshire; on the west, by Montgomeryshire and Denbighshire, in Wales. Its length is between 30 and 40 miles, its breadth about 30, and its circumference about 134. It is an inland county, of an almost circular form; and contains 890,000 acres, 139,000 inhabitants, and 15 hundreds, in which are 170 parishes and 15 market-towns. It makes a part of three bishoprics, viz. Herefordshire, Coventry and Litchfield, and St Asaph. Some part of it lies on the north, and some on the south side of the Severn. Besides the Severn, it is also watered by the Tifidiane, or Fafidiane, as it is called in Welch, which flows from the mountains of Radnorshire; and by the Tern, which has its rise and name from one of those pools called *tearnes* in Staffordshire. All these abound with fish, especially trouts, pikes, lampreys, graylings, carp, and eels. The air, especially upon the hills, with which the county abounds, is very wholesome. There is as great a diversity of soil, as in most other counties. On the hills, where it is poor, is very good-pasture for sheep; and in the low grounds, where it is very rich, along the Severn in particular, there is plenty of grafs for hay and black cattle, with all sorts of corn. No county is better provided with fuel than this, having in it many inexhaustible pits of coal; and also mines of lead and iron. Over most of the coal-pits in this county lies a stratum or layer of blackish porous rock, of which, by grinding and boiling, they make pitch and tar, which are rather better than the common sort for caulking ships, as they do not crack, but always continue close and smooth. Quarries of lime-stone and iron-stone are common enough in the county; and the soil in many places is a reddish clay. As it lies upon the borders of Wales, it was anciently full of castles and walled towns. On the side next that country there was an almost continued line of castles, to guard the county against the inroads and depredations of the Welch. The borders here, as those between England and Scotland, were called *marches*, and there were certain noblemen intitled *barones marchie*, *marchiones de marchia Wallie*, "lords marchers, or marquisses of the marches of Wales," who were vested with a sort of palatine jurisdiction, held courts of justice to determine controversies, and enjoyed many privileges and immunities, the better to enable and encourage them to protect the county against the incursions of the Welch, and to maintain order amongst the borderers; but they often abused their power, and were the greatest of tyrants.

As to the ecclesiastical government of the county, the far greater part, namely, all that belongs to the bishoprics of Hereford, and of Litchfield and Coventry, is under the jurisdiction and visitation of the arch-deacon of Shrewsbury or Salop, and is divided into several deaneries.

The Oxford circuit includes in it this county, which sends 12 members to parliament, viz. two for the shire, and two for each of the following towns, Shrewsbury, Ludlow, Wenlock, and Bishop's Castle.

SHROVE-TUESDAY, is the Tuesday after Quinquagesima Sunday, or the day immediately preceding the first Lent; being so called from the Saxon word

ſhrive,

Shrive, which signifies to *confess*, as having been employed by the people in the time of Popery in confessing their sins in order to receive the sacrament, and thereby qualify themselves for a more religious observation of Lent.

SHROUDS, (*serud* Sax.) a range of large ropes extending from the mast-heads to the right and left side of the ship, to support the masts and enable them to carry sail, &c.

The shrouds as well as the sails are determined from the masts to which they belong. Thus they are the main, fore, and mizen shrouds; the main-top-mast, fore-top-mast, or mizen top-mast-shrouds; and the main-top-gallant, fore-top-gallant, or mizen-top-gallant shrouds.—The number of shrouds by which a mast is sustained, as well as the size of rope of which they are formed, is always in proportion to the size of the mast and the weight of the sail it is intended to carry. See **MAST** and **SAIL**.

SHRUB, in botany, a plant which rises with a woody durable stem, to a height superior to that of under-shrubs, inferior to that of trees.

SHUTTLE, in the manufactures, an instrument much used by weavers, in the middle of which is an eye or cavity, wherein is inclosed the spool with the wool.

SIALOGOGUES, medicines which promote the salivary discharge.

SIAM, a kingdom of Asia in the East Indies, bounded on the north by Laos; on the east, by Cam-bays and Keo; on the south, by a gulph of the same name; and on the west, by the peninsula of Malacca. It is about 550 miles in length from north to south, and 250 in breadth where it is broadest. In the rainy season the rice-fields and meadows are overflowed in such a manner as to render them very fruitful. The city of Siam stands on an island made by the river, in a low country, and is as fruitful as any spot of ground in the world; for it produces rice, several kinds of pulse, many fruits and roots, with wild and tame cattle, and the river abounds in many sorts of excellent fish. The city is about ten miles in circumference; and there are many canals from the river, which cross the town several ways. The walls are high and thick, and are constructed of brick and stone; but the houses, though large, are low, and built on stakes driven into the ground, about ten or twelve feet high. The king has three palaces; and there are many large temples, well adorned and decorated with gilded images. The women in Siam are the only merchants in buying goods, and generally maintain their husbands with their traffic. The Europeans while at Siam accommodate themselves with temporary wives; for the women are very fond of foreigners, and they agree with each other in the preference of their nearest friends and relations, and then it is a lawful marriage for the time agreed upon. These wives are very obliging, and take the whole management of the household-affairs into their own hands. They buy provisions, dress the victuals, and take care of the cloaths, washing and mending them. If their husbands have any goods to sell, they set up a shop, and dispose of them by retail, which is of more advantage than selling them by wholesale. If the husband leaves the kingdom, and is willing to continue the marriage, he leaves her about

6 s. 8 d. a month to live upon in his absence, otherwise she may take another husband at the year's end. And here it must be noted, that women are never the worse esteemed for having been married to foreigners.

The natives of both sexes go bare-headed, and cut their hair so as to leave it two inches long, and then they gum it, and comb it upwards; so that it looks rather like bristles than hair, and makes their heads seem very large. They are well shaped, and have a large forehead, with a little nose, and a handsome mouth, with plump lips, and black sparkling eyes. The lappits of their ears are thick, and the men have but little hair on their chins. The men are of an olive complexion; but the women are of a straw-colour, and very prolific. Even the courtiers have nothing but a cloth which reaches from the waist to the middle of the thigh, and a sort of a waistcoat made of muslin, with a cap upon their head covered with muslin, and terminating in a point. The cloth that the men wrap about their middles is brought round between their legs, and turned into their girdles behind: but that of the women hangs down a little below their knees; and they cover their breasts with another cloth, throwing the ends over their shoulder; the rest of their bodies is quite naked, nor have they any covering on their heads: this must be understood of the better sort; for the common people of both sexes go quite naked, except a covering for those parts which decency requires them to hide. They however adorn themselves with rings, bracelets, and pendants. The general doctrine of this country is the transmigration of the soul.

SIBERIA, a very large country of Asia, extending along all the northern part of the continent from the northern confines of Tartary quite to the Frozen Sea.

At what time this country was first inhabited, or by whom it was peopled, we are entirely ignorant. The Russians, from whom we have received our knowledge, knew nothing of it before the middle of the 16th century. In the reign of John Basilowitz I. indeed, an incursion had been made into Siberia, and some Tartar tribes subdued: but these conquests were not permanent; and we hear of no further communication between Russia and Siberia till the time of John Basilowitz II. It was opened again at that time by means of one Anika Strogonoff, a Russian merchant who had established some salt-works at a town in the government of Archangel. This man carried on a trade with the inhabitants of the north-west parts of Siberia, who brought every year to the town above-mentioned, large quantities of the finest furs. Thus he acquired a very considerable fortune in a short time; when at last the czar, perceiving the advantages which would accrue to his subjects from having a regular intercourse with Siberia, determined to enlarge the communication which was already opened. With this view he sent into Siberia a body of troops, who crossed the Yugorian mountains which form part of the north-eastern boundary of Europe. They seem, however, not to have passed the Irtysh, or to have penetrated further than the western branch of the river Obi. Some Tartar tribes were laid under contribution, and a chief named *Yediger* consented to pay an annual tribute of a thousand fables. But this produced no lasting advantage to Russia; for, soon after, Yediger

Siberia,
Sibyls.

was defeated and taken prisoner by Kutchum Khan, a descendant of the Great Jenghiz Khan: and thus the allegiance of this country to Russia was dissolved.

For some time we hear of no further attempts made by the Russians on Siberia; but in 1577 the foundation of a permanent conquest was laid by one Yermac Temofeeff, a Cossack of the Don. This man was at first the head of a party of banditti who infested the Russians in the province of Casan; but being defeated by the troops of the czar, he retired with 6000 of his followers into the interior parts of that province. Continuing his course still eastward, he came to Orel, the most easterly of all the Russian settlements. Here he took up his winter-quarters: but his restless genius did not suffer him to continue for any length of time in a state of inactivity; and from the intelligence he procured concerning the situation of the neighbouring Tartars of Siberia, he turned his arms toward that quarter.

Siberia was at that time partly divided among a number of separate princes, and partly inhabited by the various tribes of independent Tartars. Of the former Kutchum Khan was the most powerful sovereign. His dominions consisted of that tract of country which now forms the south-western part of the province of Tobolsk; and stretched from the banks of the Irtysh and Obi to those of the Tobol and Tura. His principal residence was at Sibir, a small fortress upon the river Irtysh, not far from the present town of Tobolsk, and of which some ruins are still to be seen. After a course of unremitted fatigue, and a series of victories which almost exceed belief, but of which we have not room to give the detail, our intrepid adventurer dispossessed this prince of his dominions, and seated himself on the throne of Sibir. The number of his followers, however, being greatly reduced, and perceiving he could not depend on the affection of his new subjects, he had recourse to the czar of Muscovy, and made a tender of his new acquisitions to that monarch, upon condition of receiving immediate and effectual support. This proposal was received with the greatest satisfaction by the czar; who granted him a pardon for all former offences, and sent him the required succours. Yermac, however, being soon after drowned in an unsuccessful excursion, the Russians began to lose their footing in the country. But fresh reinforcements being seasonably sent, they not only recovered their ground, but pushed their conquests far and wide; wherever they appeared, the Tartars were either reduced or exterminated. New towns were built, and colonies were planted on all sides. Before a century had well elapsed, all that vast tract of country now called *Siberia*, which stretches from the confines of Europe to the Eastern Ocean, and from the Frozen Sea to the present frontiers of China, was annexed to the Russian dominions.

For an account of the climate, soil, and produce, &c. of this vast region, see the articles *КАМТЧАТКА* and *TARTARY*.

SIBYLS, in pagan antiquity, certain women said to have been endowed with a prophetic spirit, and to have delivered oracles for showing the fates and revolutions of kingdoms, &c. The most eminent of the ten Sibyls mentioned by the ancient writers was she whom the Romans called the *Cumean* or *Erythraean*

Sibyl, from her being born at Erythræ in Ionia; and removed from thence to Cumæ in Italy, where she delivered all her oracles from a cave dug out of the main rock, according to Virgil, *Æneid* III. 441, &c.

There is still preserved, in eight books of Greek verses, a collection of verses pretended to have been delivered by the Sibyls: but the generality of critics look upon them as spurious; and it is the opinion of Prideaux that the story of the books of the Sibyls told to Tarquin was a state-trick or fetch of politics.

SICILY, a large island of the Mediterranean sea, lying near the coast of Italy, between 12° and 16° E. Long. and between 37° and 39° N. Lat. being about 170 miles long and 100 broad. It is divided from Italy by the straits of Messina, reaching from the Tower of Faro, which is the most northerly part of the island, to the *Capo dell' armi*, or the Cape of Arms, the most southern part of Calabria. These straits, by the Latins called *Ætrem, Siculum*, by the Italians *Il Faro di Messina*, and by us the *Fare of Messina*, are between 12 and 15 miles over in the broadest places, and in the narrowest about a mile and an half; inasmuch that when Messina was taken by the Carthaginians, many of the inhabitants are said to have saved themselves by swimming to the opposite coasts of Italy. Hence has arisen an opinion that the island of Sicily was originally joined to the continent, but afterwards separated by an earthquake or some other natural cause. This separation, however, is reckoned by the most judicious among the ancients to be fabulous; and they content themselves with speaking of it as a thing said to have happened.

Anciently this island was called *Sicania, Sicilia*, and *Trinacria* or *Triquetra*; the two former it had from the Sicani and Siculi, who peopled a considerable part of the country; the two latter from its triangular figure. Its first inhabitants, according to the most respectable ancient authors, were the Cyclopes and Lætrigones, who are said to have settled in the countries adjoining to Mount Ætna; but of their origin we know nothing, except what is related by the poets. After them came the Sicani, who called themselves the original inhabitants of the country; but several ancient historians inform us that they came from a country in Spain watered by the river Siconus. Diodorus, however, is of opinion, that the Sicani were the most ancient inhabitants of this island. He tells us that they were in possession of the whole, and applied themselves to cultivate and improve the ground in the neighbourhood of Ætna, which was the most fruitful part of the island: they built several small towns and villages on the hills to secure themselves against thieves and robbers; and were governed, not by one prince, but each city and district by its own king. Thus they lived till Ætna began to throw out flames, and forced them to retire to the western parts of the island, which they continued to inhabit in the time of Thucydides. Some Trojans, after the destruction of their city, landed in the island, settled among the Sicani, and built the cities of Eryx and Egesta, uniting themselves with them, and taking the general name of Elymi or Elymæi. They were afterwards joined by some Phœnicians, who settled here on their return from the siege of Troy.

After the Sicani had for many ages enjoyed an undisturbed

Sicily.

Sicily.

disturbed possession of the whole of Sicily, or such parts of it as they chose to inhabit, they were visited by the Siculi, who were the ancient inhabitants of Aufonia properly so called; but being driven out from thence by the Opici, they took refuge in the island of Sicily. Not being contented with the narrow bounds allowed them by the Sicani, they began to encroach upon their neighbours; upon which a war ensuing, the Sicani were utterly defeated, and confined to a corner of the island, the name of which was now changed from *Sicania* into that of *Sicilia*.

About 300 years after the arrival of the Siculi, the island first began to be known to the Greeks, who established various colonies, and built many cities in different parts of the island; and it is only from the time of their arrival that we have any history of the island. The first of the Greeks that came into Sicily were the Chalcidians of Eubœa, under the conduct of Thucles, who built Naxos, and a famous altar of Apollo, which, as Thucydides tells us, was still standing in his time without the city. The year after, which was, according to Dionysius Halicarnassensis, the third of the 17th Olympiad, Archias the Corinthian, one of the Heraclidæ, laid the foundations of Syracuse. Seven years after, a new colony of Chalcidians founded Leontini and Catania, after having driven out the Siculi, who inhabited that tract. About the same time Lamis, with a colony from Megara, a city of Achaia, settled on the river Panticius, at a place called *Trotilum*, where his adventurers lived some time in common with the Chalcidians of Leontini; but, being driven from thence by the Leontines, he built the city of Thapfus, where he died. Upon his death, the colony left Thapfus; and, under the conduct of Hyblon king of the Siculi, founded Megara Hyblea, where they resided 245 years, till they were driven out by Gelon tyrant of Syracuse. During their abode at Megara, they sent one Pamilus, who was come from Megara in Achaia, their original city, to build Selinus. This city was founded about 100 years after the foundation of Megara. Antiphemus and Entimus, the former a Rhodian, the other a Cretan, led each a colony of their countrymen, and jointly built the city of Gela on a river of the same name, establishing in their new settlement the Doric customs, about 45 years after the founding of Syracuse. The inhabitants of Gela founded Agrigentum 108 years after their arrival in Sicily, and introduced the same customs there. A few years after, Zancle was built by the pirates of Cumæ in Italy; but chiefly peopled by the Chalcidians, Samians, and Ionians, who chose rather to seek new settlements than live under the Persian yoke. Some time after, Anaxales, tyrant of Rhegium, drove out the ancient proprietors; and, dividing his lands amongst his followers, called the city *Messana* or *Messene*, which was the name of his native city in Peloponnesus. The city of Himera was founded by the Zancleans under the direction of Euclides, Simus, and Sacon; but peopled by the Chalcidians and some Syracusan exiles, who had been driven out by the contrary faction.

The Syracusians built Acra, Chastanœ, and Camarina; the first 70 years, the second 90, and the third 135, after the foundation of their own city. This is the account which Thucydides, a most judicious and exact writer, gives us of the various nations,

I

Sicily.

whether Greeks or Barbarians, who settled in Sicily. Strabo counts among the ancient inhabitants of Sicily the Morgetes, who being driven out of Italy by the Oenotrians, settled in that part of the island where the ancient city of Morgantium stood. The Campani, who assumed the name of *Mamertini*, that is, *invincible warriors*, and the Carthaginians, who settled very early in Sicily, ought likewise to be counted among the ancient inhabitants of the island.

The island of Sicily continued to be divided between the Greeks and Carthaginians till the wars of the latter with the Romans, when the whole island was reduced to a province of that republic about the year 198 B. C. The free cities in the island before this time, besides Syracuse, were Leontini, Agrigentum, Gela, Messana, Himera, Catania, Ætna, Apollonia, Selinus, Taurominium, Agyris, and Centuripe. These underwent the same vicissitudes as SYRACUSE; being sometimes governed by their own laws, and at other times enslaved by domestic tyrants, till finally subdued by the Romans.

During the time of its subjection to the Romans, Sicily was not treated as the other conquered countries, but suffered to enjoy its ancient rights and privileges. This distinction it well deserved, since the Sicilians were the first of foreign nations that had entered into an alliance with Rome, and the first conquest that the republic made out of Italy. This island was afterwards a kind of pass for their troops into Africa; and Rome would not so easily have reduced the formidable power of Carthage, had not Sicily served as a magazine for supplying her armies with provisions, and been a secure retreat for her fleets. Hence Scipio Africanus, after having taken and destroyed Carthage, thought himself obliged to adorn the cities of Sicily with some of the richest spoils he had brought from Africa, that the Sicilians might have among them some monuments of those victories to which they had greatly contributed.

About the time of the sedition of the Gracchi, a most dangerous insurrection of the Sicilian slaves took place on the following occasion. The best estates in that country were in the hands of some rich men of the natives, and of the Roman knights (those opulent publicans), who, finding their account more in employing slaves than husbandmen of free condition to cultivate the farms, had transported such multitudes of slaves thither, that the island swarmed with them. The ill treatment these wretches suffered from their masters, who scarce allowed them necessary food or raiment, put them upon seeking by rapine what was needful for the support of life. They frequently went out in gangs, plundered villages, and exercised all kinds of violence. The several prætors, successively sent from Rome into the island, had, out of fear of the masters to whom the slaves belonged, neglected doing any thing effectual to remedy these disorders: for the Roman knights were a powerful body, whom it was dangerous to disoblige. Impunity naturally increased the mischief; the slaves grew daily more licentious; and their going out in bands to rob, gave them an opportunity of forming plots to deliver themselves from the yoke of servitude.

It happened that one Antigones, a Cicilian, had a Syrian slave named *Eunus*, a man of spirit, and who

had a particular talent for imposing on the multitude. He pretended to have, by dreams and sensible apparitions, intercourse with the gods. By breathing flames out of his mouth, and by a variety of other juggling tricks, he got at length into such vogue as to pass for an oracle. Whole crowds came to him to be told their fortunes. As to himself, he constantly published that his destiny was to be a king. His master, diverted with this whim, used frequently, when at table, to question him concerning his future royalty, and the manner in which he would treat each of the guests then present. According to his different answers, some insulted him, others sent him meat from the table, craving his future protection when he should be upon his throne. The jest proved serious in the event, as we shall presently see, and Eunus did not forget the different treatment he had met with from his master's guests.

Among those who repaired to this prophet for advice, there came at length the slaves of one Damophilus of Enna, a man of brutal character, and who had a wife no less inhuman. Cruelly treated by both, the slaves had formed a plot to murder both. However, before they proceeded to action, they thought it advisable to ask the oracle of the country, Whether the gods would prosper them in an enterprise they were meditating? Eunus answered, That whatever was their project, it was agreeable to the gods, and would infallibly succeed, provided they did not defer the execution. The slaves, thereupon, to the number of 400, armed with forks and scythes and other rustic weapons, assembled themselves in all haste, put Eunus at their head, and straight marched to Enna; where, being joined by the slaves of the town, they massacred the inhabitants, without regard to age or sex, and plundered the houses. As for Damophilus, Eunus, to try him in form, erected, in the public theatre, a court of judicature, where he himself presided. Some of those slaves, whom the prisoner had treated barbarously, made themselves the accusers; and the multitude was judge. Damophilus pleaded earnestly for himself, and moved many to compassion; but Hermias and Zeuxis, two slaves, more spirited with revenge, and more audacious than the rest, approaching the accused, one of them, without farther ceremony, ran him thro' with a sword, and the other cut off his head with an ax. And now Eunus was elected king, not for his valour or skill in martial affairs, but on account of his pretended inspirations. He began his reign by putting to death all the prisoners, except such as could make arms, and those of his master's acquaintance who had used him civilly. He also gave up Damophilus's wife, Megallis, into the hands of her women-slaves, who, when they had whipped and otherwise tormented her as much as they pleased, threw her headlong down a precipice: but as for her daughter, who had always disapproved the barbarity of her parents, and showed great compassion to the slaves, they treated her with all imaginable respect and tenderness, and conveyed her safely to Catana, where they delivered her into the care of some of her relations. Eunus with his own hands slew Pytho and Antigones, the two masters he had successively served. After which, putting the regal circle on his head, and assuming the other ornaments of sovereignty, he took the name of *Antiochus*, and called his

followers *Syriani*. His next affair was to establish a form of government among his subjects. He chose out some of the ablest men to be his council; and gave the command of his troops to an Achæan, an old soldier, who by his bravery and experience was qualified to command a better army. In three days, his followers increasing to more than 6000 men, he commenced his military expeditions. It was in the year of Rome 615 that this tumult began, Didius being then prætor of Sicily. In 616, Manlius, who succeeded him, was defeated by the rebels, and his camp plundered. The like misfortune happened to P. Cornelius Lentulus in 617; and in 618, when Calpurnius Piso was prætor, Eunus had still the advantage over the Romans. Three prætors thus vanquished successively by the slaves, struck a terror throughout the whole island. Eunus's army grew daily more numerous. Cleon, a Sicilian slave, had taken it into his head to imitate him; and, having got together 5000 slaves, had pillaged Agrigentum and the territory about it. It was hoped at first, that these two leaders would be competitors for dominion, and destroy one another; but, contrary to all mens expectations, they joined forces, and Cleon served as general under Eunus.

The Roman affairs were in this bad situation, when the prætor Plautius Hypsæus, in the year 619, came into Sicily, to restore them. Far from succeeding, he suffered a total defeat by the rebels; whose army, after this victory, augmented to near 200,000 men; they ravaged the whole country, and took many cities.

The example of the slaves in Sicily infected those in Italy and Greece, and occasioned insurrections there. These, however, were easily quelled. Calpurnius Piso, one of the consuls for the year 620, having first restored discipline, that was much relaxed among the troops, overthrew the slaves before Messana, to which they had laid siege: 8000 of them perished in the action, and the prisoners were all crucified. Notwithstanding this victory, the war continued, till Rupilius, one of the consuls of the year 621, had the command of the Roman forces. After his arrival in the island, he successfully laid siege to Tauromenium and Enna, the strongest places in the possession of the slaves. Both were betrayed into his hands. Twenty thousand of the rebels are said to have been cut off. Eunus, with 600 of his guards, escaped from Enna, and took refuge in a steep rocky place. Being there invested by the Romans, and having no hope to escape, they slew one another, to avoid a more painful death. King Eunus hid himself in a cave, whence he was quickly dragged out, together with his cook, his baker, the man that used to rub him when he bathed, and a buffoon whose business had been to divert him at his meals. Rupilius sent him in chains to Morgantia, where, consumed with vermin, he miserably ended his days in prison.

The tranquillity established on this occasion, lasted not long. The Romans, finding themselves in great danger from the Cimbri and Teutones, applied for succours to the eastern nations; and among the rest to Nicomedes king of Bithynia. That monarch, however, excused himself; alleging, that a great number of his subjects had been forcibly carried away into slavery, by those who farmed the revenues of the republic.

public in the east. The complaint appearing to the senate to be well-grounded, they passed a decree, that no freemen of the Roman allies should in any province be treated as slaves; and that the proconsuls and prætors should take care that all such as had been injuriously forced into slavery should be set free. In obedience to this decree, Licinius Nerva, prætor in Sicily, gave liberty in a few days to above 800 slaves. The chief men of the island, foreseeing how much they should be losers by the execution of this decree, addressed themselves to the prætor, and begged of him to manumit no more of the slaves. Licinius, either prevailed upon by bribes, or desiring to ingratiate himself with the rich, would no longer listen to the complaints of such of the slaves as, having been forced into slavery, had recourse to him for redress. On the contrary, he gave them rough language, and sent them home to their masters. The slaves hereupon had recourse to arms. About 200 of them having posted themselves upon a rock, fortified it, and defended themselves for some time against all the efforts of Licinius. At length he sent for one C. Titinius, who had been some years before condemned to death; but having escaped from punishment, now practised robbery. To this man Licinius promised pardon and protection, if by his means the slaves should be reduced. Titinius, with a body of his associates, went over to the rebels, as if to spirit them against their enemies. Being well received by them, and for his bravery declared their general, he soon after betrayed them into the hands of the Romans. This insurrection thus suppressed, was immediately followed by another. In a few days the rebels amounted to 2000 men; and, after a victory which they obtained over a Roman detachment, their number increased to above 6000. They then chose themselves a king, one Salvius, a pretender to the art of divination by inspecting the entrails of animals. After some time spent in plundering the country, Salvius laid siege to Morgantia; and Licinius advanced with a view to relieve the place. But the rebels turned upon him, and, having the advantage of the ground, defeated him. Only 600 men of the Roman army fell in this action, but 4000 were taken prisoners; for Salvius had prudently proclaimed quarter to all who should throw down their arms.

On the report of this victory, such multitudes flocked in to the rebels from all parts, that their army was doubled, and they renewed their attacks upon Morgantia; at the same time promising liberty to the slaves within the town. But their masters making them the same promise in case of victory, the slaves fought so bravely that they forced the rebels to raise the siege. Nevertheless Licinius annulled the promise made to those slaves, who thereupon went over to the enemy.

The contagion of rebellion spread itself to the territories of Ægesta and Lilybæum. Athenio, a Sicilian, a pretender to divination by the stars, got together about 1000 of his fellow-slaves; and he too assumed the title of king. His army increasing to 10,000 able-bodied men, (for he would not, like king Salvius, receive promiscuously all that came to him), he laid siege to Lilybæum, a place that was deemed impregnable. Athenio, after some time, became sensible of his error; and then, that he might quit his enterprise with-

out dishonour, pretended, that the gods had foretold him by the stars, that if the army continued the siege, some sudden misfortune would certainly befall it. A fleet from Mauritania, with succours sent by king Bocchus to the Romans, happened to arrive at Lilybæum just at the time when Athenio began to decamp; and those Africans landed soon enough to fall upon the rear of the rebel army, which suffered a considerable loss: but this loss was more than compensated to Athenio by the increase of credit which his astrological prediction gained him.

In the mean time Salvius, who had assumed the name of Tryphon, a name formerly borne by one of the kings of Syria, chose Triocala for his place of residence. There he built a palace; fortified the castle, which was before very strong; and enlarged the town. From hence he sent as king, a command to Athenio to come and join him with the forces he had collected. Contrary to all men's expectations, Athenio obeyed, and marched to Triocala with 3000 men; the remainder of his army he had dispersed over the country to pillage it, and to engage as many of the slaves as they could to take part with him. The two generals for some time lived amicably together; but at length Tryphon, suspecting Athenio of a design to supplant him, caused him to be seized and put under confinement.

The next year, 650, Licinius Lucullus, who succeeded Licinius Nerva in the prætorship of Sicily, landed in the island with 17,000 men. On the news of their arrival, Tryphon released Athenio, and marched with him at the head of 40,000 men to meet Lucullus. The battle was long doubtful. Athenio fought with great bravery; but having received three wounds, by two of which his legs were lamed, he at length fell among the dead. Hereupon the slaves lost courage, and took to their heels. Twenty thousand of them were slain; the rest, by favour of the night, escaped with their king to Triocala. Athenio, tho' grievously wounded, was not killed; in the dark, he made a shift to creep away and join his companions. The rebels, much disheartened by their loss, held a council to deliberate upon the state of their affairs. Some proposed submission to their masters at discretion; but the prevailing opinion was to fight it out to the last. Lucullus gave them time to recover themselves; for it was nine days after the battle before he invested Triocala; and then the rebels made so resolute a defence, that they obliged him to quit the enterprise. Nor did the Roman general take any further measures to crush the rebellion: his only care was to enrich himself at the expence of his province. Of this, at his return to Rome, he was accused before the people, and found guilty.

The prætor Servilius, who, in 651, succeeded Lucullus, had no success against the rebels. Tryphon was now dead: His successor Athenio, always brave and enterprising, forced the Roman camp, took towns, and ravaged the country at pleasure.

In 652, the fifth consulship of Marius, the senate thought proper to commission his colleague Aquilius to conduct that war, in which three prætors had been foiled. This new general applied himself chiefly to cut off the enemies' provisions; nor does he seem to have offered them battle till the next year, when their number was considerably diminished.

Sicily.

He then entirely defeated them in a general engagement, wherein, it is said, he fought hand to hand with Athenio, and killed him, after being wounded by him in the head. About 10,000 of the rebels escaped to their strong holds, where Aquilius afterwards destroyed them chiefly by famine. A thousand still remained under a leader named *Satyrus*, and these surrendered themselves. The proconsul promised them pardon; but when he had transported them to Rome, he condemned them to fight with wild beasts. This they refused to do; and chose rather to fall by the hands of one another: *Satyrus* alone remaining, he ran upon his own sword, and was the last that perished on account of this rebellion, which had lasted four years. We are told, that in this and the former servile war in Sicily a million of slaves were destroyed.

In A. D. 439, when the western empire began to fall, Sicily shared the same fate with the rest of the provinces, whose sufferings indeed had begun long before. At this time the Vandals, under their king *Genferic*, made a descent on the island, and ravaged all the open country, but were unable to take the city of Palermo, to which they laid siege; however, they returned to Africa with a very considerable booty.—In 475 *Genferic* was attended with better success; reducing not only the island of Sicily, but all those between Italy and Africa. The next year Sicily was ceded by him to *Odoacer*, (who at this time totally subverted the Roman empire in the west), on condition that he should hold the island of him, and pay him a yearly tribute; for securing which he kept the strong castle of Lilybæum. In the year 550 the whole island was reduced by *Totila* the Goth; however, it was next year given up to the emperor of Constantinople, who kept possession of it till 857, when the Arabs made a descent upon it; and five years after, according to some historians, made themselves masters of the whole. They appear to have kept possession of the island till the year 1040, when the Greeks, assisted by the Normans, took it from them. The history of Sicily from that time is related under the article NAPLES, n° 20—28.

The island has since continued in the hands of the royal family of Spain; and having been reunited to the kingdom of Naples, the king of Spain's eldest son is now king of Sicily as well as of Naples. See SPAIN.

Sicily is separated, as we have already observed, from Italy, by a narrow strait called the *Fare of Messina*. This strait is still remarkable for the rapidity of its currents, and the irregular ebbing and flowing of the sea, which sometimes rushes in with such violence as to endanger ships riding at anchor. Anciently it was much more remarkable for the *Scylla* and *Charybdis*, one a rock, and the other a whirlpool, between which it was very dangerous to steer, and concerning which so many fables have been related by the ancients. *Scylla* is a rock on the Italian side, opposite to *Cap Plores*, which runs out into the sea on the Sicilian side. Mr *Brydone* informs us, that the navigation of the straits is not even yet performed without danger. He informs us, that the noise of the current which sets through the straits may be heard for several miles, like the roaring of some large impetuous river confined between narrow banks. In

many places the water rose into whirlpools and eddies, which are dangerous to shipping. The current set exactly for the rock of *Scylla*, and would certainly have carried any thing thrown into it against that point. Our author, however, is by no means of opinion that the strait is so dangerous as the ancients have represented it; though he thinks that the strait is now probably much wider than formerly, which may have diminished the danger. There are many small rocks, which show their heads near the base of the large ones. These are probably the dogs, described by the ancient poets as howling round *Scylla* *. The rock is near 200 feet high, and has a kind of castle or fort built on its summit with a town called *Scylla* or *Sciglis*, containing 300 or 400 inhabitants on its south side, which gives the title of prince to a *Calabrese* family.

* See
Scylla

Charybdis is now so much diminished, that it seems almost reduced to nothing in comparison of what it was; though even yet it is not to be passed without danger. See CHARYBDIS.

In the straits, Mr *Brydone* informs us, a most surprising phenomenon is to be observed. In the heat of summer, after the sea and air have been much agitated, there appear in the heavens over the straits a great variety of singular forms, some at rest, and others moving with great velocity. These forms, in proportion as the light increases, seem to become more aerial, till at last, some time before sun-rise, they totally disappear. The Sicilians represent this as the most beautiful sight in nature. *Leonti*, one of their best and latest writers, says, that the heavens appear crowded with a variety of objects, such as palaces, woods, gardens, &c. besides the figures of men and other animals that appear in motion among them. Some treatises have been written concerning this phenomenon; but nothing satisfactory has been delivered concerning its cause.

Though Sicily lies in a warm climate, the air is healthful, being refreshed with sea-breezes on every side. Anciently its fertility was such, that it was styled the granary or store-house of Italy; nor has it yet lost its glory in this respect, producing, in great abundance, corn, wine, oil, fruits, sugar, honey, wax, saffron, and silk. Here are also some mines of gold, silver, iron, and other metals; with several kinds of minerals, as alum, vitriol, saltpetre, and mineral salt. The mountains yield also emeralds, jasper, agate, porphyry, and lapis lazuli. A good deal of coral is found upon the coast, and plenty of excellent fish; among which are the pefce spada, or sword-fish, and tunnies.

Of these commodities, particularly silk, raw or manufactured, great quantities used to be exported from *Messina*, the great sea-port and emporium of the kingdom; where a consul from almost every nation in Europe resided, to manage and protect the trade of his nation. But that city is now no more; having been totally destroyed by the late earthquake and eruption of *Ætna*, (Feb. 5. 7. 8. 1783), when a vast number of inferior towns and villages, together with the *Lipari* islands adjacent, are said to have shared the same fate, and most of their inhabitants, including many of the first eminence, to have perished.

Here are several rivers and good springs; but few of

Sicily
Sidereo-
lum.

of the rivers are navigable, having but a short course, and descending precipitately from the mountains. The chief are the Cantera, the Jarretta, and the Salfo; of which, the two former run from west to east, and the third from north to south.

Of the mountains in this island the most noted is Mount *Ætna*, now called *Monte Gibello*, or *Mongibello*, a volcano whose eruptions have often proved fatal to the neighbouring country. See *Ætna*.

While Sicily was immediately subject to Spain, it was governed by a viceroy sent thither, who received from thence a revenue of above 4,000,000 crowns; but since it hath, jointly with Naples, been erected into a kingdom, under the name of the Two Sicilies, the face of affairs, as well as form of government, is said to be much altered, though, it is to be feared, not much in favour of the inhabitants. The nobility are so numerous in this island, that Labit says it is paved with noblemen; there being no less than 60 dukedoms, 56 marquises, and upwards of 100 earldoms, besides a great number of baronies. This people, with respect to their character, are far from appearing in a favourable light; being represented as a perverse race, who must be kept under with a high hand, according to an old proverb, *Insulani plerumque, Siculi autem omnium pessimi*. They are a mixture of Italians and Spaniards; but speak chiefly Spanish, and follow the Spanish fashions, particularly in wearing black. The established religion of the island is the Roman-Catholic. The Jews are now allowed to settle here, and make open profession of their religion; which was not the case while the island was immediately subject to Spain. The number of churches, convents, and religious foundations here, is very great, and they are well endowed. There is a sovereign tribunal, which judges in all ecclesiastical affairs, and admits of no appeal to the pope. The island is commonly divided into three parts or provinces, viz. Val di Demoni, Val di Noto, and Val Mazara.

SICINNIUS (Dentatus), a tribune of the people, lived a little after the expulsion of the kings from Rome. He was in 120 battles and skirmishes, besides single combats, in all of which he came off conqueror. He served under nine generals, all of whom triumphed by his means. In these battles he received 45 wounds in the fore-part of his body, and not one in his back. The senate made him great presents, and he was honoured with the name of the Roman Achilles.

SIDEREAL YEAR. See *ASTRONOMY*, n° 290.

SIDERIA, in natural history, the name of a genus of crystals, used to express those altered in their figure by particles of iron. These are of a rhomboidal figure, and composed only of six planes. Of this genus there are four known species. 1. A colourless, pellucid, and thin one; found in considerable quantities in the iron ores of the forest of Dean in Gloucestershire, and in other the like places. 2. A dull, thick, and brown one; not uncommon in the same places with the former. And, 3. A black and very glossy kind, a fossil of great beauty; found in the same place with the others, as also in Leicestershire and Suffex.

SIDEROXYLUM, IRON-WOOD; a genus of the monogynia order, belonging to the pentandria class of

plants. There are four species; the inerme, the oppositifolium, the lycioides, and the tenax.

The wood of these trees being very close and solid, has given occasion for this name being applied to them, it being so heavy as to sink in water; and the title of iron-wood having been applied to the wood by the inhabitants of the countries where it grows, has occasioned the botanists to constitute a genus by this name. But as the characters of the plants have not been so well examined as could be wished, occasioned by their seldom flowering in Europe, it is very probable, that the plants which have been ranged under this genus do not properly belong to it; for Dr Plukenet has figured a plant under the title of *ebenus Jamaicensis*, whose characters are very different from those assigned to this genus: and the Jamaica iron-wood is totally different from both in its characters, for this has male and female flowers on different trees; the male flowers have no petals.

These plants are natives of warm countries; so cannot be preserved in this country unless they are placed, the two former in a warm stove, the others in a green-house. They are propagated by seeds, when these can be procured from abroad.

SIDNEY (Sir Philip), the eldest son of Sir Henry Sidney, and Mary the daughter of John Dudley duke of Northumberland, was born in the year 1554 at Penshurst in Kent. From a grammar-school at Shrewsbury he was sent to Christ-church, Cambridge, where he continued till the age of 18, and then set out upon his travels. Immediately on his arrival in France, Charles IX. made him one of his gentlemen of the bed-chamber; but he had hardly entered upon his office, before the horrid massacre of the Protestants began. He saved his life by taking refuge in the house of Sir Francis Walsingham the English ambassador. Not choosing to continue longer at the court of an infernal assassin, he travelled to Francfort, where he became acquainted with the learned Hubert Languet, whose future epistles to Sir Philip Sidney have been so much admired. In 1573, he set out for Vienna, whence he proceeded to Hungary, and thence to Italy, where he continued till the latter end of summer 1574. Returning thro' Germany and Flanders, he arrived in England in May 1575.

Our young traveller was at this time only in the 11th year of his age; nevertheless, the queen was so charmed with his abilities and address, that in 1576 she sent him ambassador to congratulate the emperor Rodolph II. on his accession, charging him at the same time with several important negotiations with other German princes.

In 1579, he wrote a private letter to the queen, dissuading her from the marriage then in agitation with the duke of Anjou; which letter seems to have been taken by her majesty in good part. In the following year Mr Sidney had a quarrel with the earl of Oxford in a tennis-court; which probably would have ended in a duel, had not the queen interfered. However, Sidney was disgusted, retired from court, and amused himself with writing his *Arcadia*. Whilst he was thus employed, the Spaniards having taken possession of the kingdom of Portugal on the death of the late king Don Antonio, the competitor for that crown earnestly solicited Mr Sidney's aid.

Sidney.

Sidney.

In 1581, we find our young hero again at court, principally engaged in jousts and tournaments, which were celebrated for the entertainment of the duke of Anjou, then in England; whom he accompanied, with several of the first nobility, to Antwerp. In 1583, the prince Palatine being installed knight of the garter, Mr Sidney was appointed to possess the stall in his name, and received the honour of knighthood on that occasion. In 1585, he projected an expedition to America, in conjunction with Sir Francis Drake; but when he was at Plymouth ready to sail, he received an express from the queen, brought by a peer of the realm, commanding him to return to court.

Soon after this disappointment, he was made governor of Flushing, and general of horse under his uncle the earl of Leicester, who at that time commanded the queen's troops in the Low Countries. In this service, his courage, prudence, and sagacity, were so eminently conspicuous, that his fame became universal; so universal, that the republic of Poland would probably have elected him their king, had not queen Elizabeth refused her assistance. On the 22d of September 1586, in a luckless hour, the gallant Sidney was sent out with a party to intercept a convoy marching towards Zutphen. The morning being hazy, they fell into an ambuscade of the enemy, and Sir Philip having just mounted his second horse, received a shot in the thigh, which broke the bone to pieces. He was carried to Arnhem, and on the 17th of October expired. Thus fell the amiable, the virtuous, the accomplished, the brave, Sir Philip Sidney, in the 32d year of his age; a polite scholar, the patron of learning and genius, and the object of universal panegyric. His body was brought to England, and buried with great pomp, at the queen's expense, in St Paul's cathedral. The funeral procession was so uncommonly magnificent, as to be deemed a subject worthy the pencil of Lant, an eminent designer. It was afterwards engraved on 34 plates by Theodore de Brie, a native of Liege.

SIDNEY (Algernon), was second son of Robert earl of Leicester. During the civil wars, he adhered to the interest of parliament, in whose army he was a colonel; and was nominated one of the king's judges, though he did not sit among them. He was a zealous republican; and consequently a violent enemy to Cromwel, after he had made himself protector. In 1659 he was appointed by the council of state to go with Sir Robert Honeywood, and Bulstrode Whitelocke, Esq; commissioners to the Sound, to mediate a peace between the kings of Sweden and Denmark. At the restoration, colonel Sidney would not personally accept of the oblivion and indemnity then generally granted to the whole nation, but continued abroad till 1677, when he obtained from the king a particular pardon, upon repeated promises of constant quiet and obedience for the future. In 1683, however, he was accused of being concerned in the Rye-house plot; and after the lord Russell had been examined, he was next brought before the king and council. He said that he would make the best defence he could, if they had any proof against him; but he would not fortify their evidence by any thing he should say; so that the examination was very short. He was arraigned for high-treason before the lord chief justice Jeffreys at the king's bench, tried, found guilty, and beheaded in

1683. He wrote *Discourses on Government*, which have been often printed, and are esteemed decisive authorities in politics; inasmuch, that some have declared them an ample recompence for the loss of Cicero's six books *De Republica*. It is certain they abound with strong sense and good learning; and show their author to have been very consummate in the knowledge of human nature and civil polity.

SIDON, (anc. geog.), a city of Phœnicia in Asia, famous in Scripture for its riches, arising from the extensive commerce carried on by its inhabitants. Heavy judgments were denounced against the Sidonians on account of their wickedness, which were accomplished in the time of Ochus king of Persia: for that monarch having come against them with an army on account of their rebellion, the city was betrayed by its king; upon which the wretched inhabitants were seized with such despair, that they set fire to their houses, and 40,000, with their wives and children, perished in the flames.

SIEGE, in the art of war, is to surround a fortified place with an army, and approach it by passages made in the ground, so as to be covered against the fire of the place.

SIEGEN, a town of Germany in Wetteravia, with a castle and the title of a principality, which it gives to a branch of the house of Nassau. It is seated on a river of the same name, in E. Long. 8. 5. N. Lat. 50. 43.

SIENNA, a large, ancient, and celebrated city of Tuscany in Italy; capital of the Siennese, with an archbishop's see, a famous university, and a citadel. It is about four miles in circumference, and surrounded with an old wall. The metropolitan church is much esteemed by travellers; and though it is a Gothic structure, the architecture is admirable. It is built with black and white marble, and the pavement is of mosaic work. The town is adorned with a great number of palaces, fountains, and superb churches, as also a magnificent hospital. The great area is round, and the houses about it are of the same height, supported by piazzas, under which people may walk in all weathers; in the middle is a basin, which they can fill with water at any time, and represent a sea-fight with small vessels. The Italian language is taught here with such purity, that a great many foreigners frequent it on that account. It is seated on three eminences, in a fertile soil; in E. Long. 11. 26. N. Lat. 43. 20.

SIENNESE, a duchy in Italy; bounded on the north by the Florentino, on the south by the Mediterranean sea and the duchy of Castro, on the east by the Perugino and Orvietano, and on the west by the Florentino and the Tuscan sea; being about 55 miles in length, and as much in breadth. The soil is pretty fertile, especially in mulberry-trees, which feed a great number of silk-worms; and there are several mineral springs. Sienna is the capital town.

SIERRA MORENA, mountains of Andalusia in Spain.

SIFANTO, or SIPHANTO, an island of the Archipelago, to the west of Paros, to the north-east of Milo, and to the south-west of Serphanto. The air is so good here, that many of the inhabitants live to the age of 120; and their water, fruits, wild fowl, and poultry

Sidon
Sifanto.

poultry, are excellent, but more especially the grapes. It abounds with marble and granite, and is one of the most fertile and best cultivated of these islands. The inhabitants employ themselves in cultivating olive-trees and capers; and they have very good silk. They trade in figs, onions, wax, honey, and straw-hats; and may be about 8000 in all. E. Long. 25. 15. N. Lat. 38. 0.

SIEUR, a title of respect among the French, like that of *master* among us. It is much used by lawyers, as also by superiors in their letters to inferiors.

SIGETH, a town of Lower Hungary, and capital of a county of the same name. It is seated in a morass, and has a triple wall, with ditches full of water; and is defended by a citadel, being one of the strongest places in Hungary. It now belongs to the house of Austria, and was retaken from the Turks in 1669, after it had been blocked up two years. In some maps it is called *Zigat*. E. Long. 18. 30. N. Lat. 46. 35.

SIGHT, or **VISION**. See **ANATOMY**, n° 406. and *Index* subjoined to **OPTICS**.

Imperfection of SIGHT with regard to Colours.—Under the article **COLOURS**, is given an instance of a strange deficiency of sight in some people who could not distinguish between the different colours. In the *Phil. Transf.* Vol. LXVIII. p. 611. we have an account of a gentleman who could not distinguish a claret colour from black. These imperfections are totally unaccountable from any thing we yet know concerning the nature of this sense.

SIGN, in general, the mark or character of something absent or invisible. See **CHARACTER**.

Among physicians, the term *sign* denotes some appearance in the human body which serves to indicate or point out the condition of the patient with regard to health or disease.

SIGN, in algebra. See **ALGEBRA**, sect. i.

SIGN, in astronomy, a constellation containing a 12th part of the zodiac. See **ASTRONOMY**, n° 110. 135.

SIGNALS, certain alarms or notices used to communicate intelligence to a distant object at sea.

Signals are made by firing artillery, and displaying colours, lanterns, or fire-works; and these are combined by multiplication and repetition. Thus, like the words of a language, they become arbitrary expressions, to which we have previously annexed particular ideas: and hence they are the general sources of intelligence throughout a naval armament, &c.

Signals ought to be distinct, with simplicity. They are simple when every instruction is expressed by a particular token, in order to avoid any mistakes arising from the double purport of one signal. They are distinct when issued without precipitation, when sufficient time is allowed to observe and obey them, and when they are exposed in a conspicuous place, so as to be readily perceived at a distance.

All signals may be reduced into three different kinds, viz. those which are made by the sound of particular instruments, as the trumpet, horn, or fife; to which may be added, striking the bell or beating the drum. Those which are made by displaying pendants, ensigns, and flags of different colours; or by lowering or altering the position of the sails; and, finally, those which are executed by rockets of different kinds; by

firing cannon or small arms; by artificial fire-works; and by lanterns.

Firing of great guns will serve equally in the day or night, or in a fog, to make or confirm signals, or to raise the attention of the hearers to a future order. This method, however, is attended with some inconveniences, and should not be used indiscriminately. Too great a repetition of the cannon is apt to introduce mistakes and confusion, as well as to discover the track of the squadron. The report and flight of the rockets is liable to the same objection, when at a short distance from the enemy.

It is then, by the combination of signals, previously known, that the admiral conveys orders to his fleet; every squadron, every division, and every ship of which has its particular signal. The instruction may therefore occasionally be given to the whole fleet, or to any of its squadrons; to any division of those squadrons, or to any ship of those divisions.

Hence the signal of command may at the same time be displayed for three divisions, and for three ships of each division; or for three ships in each squadron, and for only nine ships in the whole fleet. For, the general signal of the fleet being shown, if a particular pendant be also thrown out from some particular place on the same mast with the general signal, it will communicate intelligence to nine ships that wear the same pendant.

The preparatory signal given by the admiral to the whole or any part of his fleet, is immediately answered by those to whom it is directed; by showing the same signal, to testify that they are ready to put his orders in execution. Having observed their answer, he will show the signal which is to direct their operations: as, To chase, to form the line, to begin the engagement, to board, to double upon the enemy, to rally or return to action, to discontinue the fight, to retreat and save themselves. The dexterity of working the ships in a fleet depends on the precise moment of executing these orders, and on the general harmony of their movements; a circumstance which evinces the utility of a signal of preparation.

As the extent of the line of battle, and the fire and smoke of the action, or other circumstances in navigation, will frequently prevent the admiral's signals from being seen throughout the fleet, they are always repeated by the officers next in command; by ships appointed to repeat signals; and, finally, by the ship or ships for which they are intended.

The ships that repeat the signals, besides the chiefs of squadrons or divisions, are usually frigates lying to windward or to leeward of the line. They should be extremely vigilant to observe and repeat the signals, whether they are to transmit the orders of the commander in chief, or his seconds, to any part of the fleet; or to report the fortunate or distressful situation of any part thereof. By this means all the ships from the van to the rear will, unless disabled, be ready at a moment's warning to put the admiral's designs in execution.

To preserve order in the repetition of signals, and to favour their communication, without embarrassment, from the commander in chief to the ship for which they are calculated, the commanders of the squadrons repeat after the admiral; the chiefs of the divisions, ac-

Signals
Silene.

cording to their order of the line, after the commanders of the squadrons; and the particular ships after the chiefs of the divisions; and those in return, after the particular ships, *vice versa*, when the object is to convey any intelligence from the latter to the admiral.

Besides the signals above-mentioned, there are others for different ranks of officers; as for captains, lieutenants, masters, &c. or for any of those officers of a peculiar ship.

SIGNALS by the Drum, made use of, in the exercise of the army, instead of the word of command, viz.

| SIGNALS. | Operations. |
|-------------------------------|------------------------------------------------|
| <i>A short roll,</i> - | To caution. |
| <i>A flam,</i> - | To perform any distinct thing. |
| <i>To arms,</i> - | To form the line or battalion. |
| <i>The march,</i> - | To advance, except when intended for a salute. |
| <i>The quick march,</i> - | To advance quick. |
| <i>The point of war,</i> - | To march and charge. |
| <i>The retreat,</i> - | To retreat. |
| <i>Drum ceasing,</i> - | To halt. |
| <i>Two short rolls,</i> - | To perform the flank-firing. |
| <i>The dragon march,</i> - | To open the battalion. |
| <i>The grenadier march,</i> - | To form the column. |
| <i>The troop,</i> - | To double divisions. |
| <i>The long roll,</i> - | To form the square. |
| <i>The grenadier march,</i> - | To reduce the square to the column. |
| <i>The preparative,</i> - | To make ready and fire. |
| <i>The general,</i> - | To cease firing. |
| <i>Two long rolls,</i> - | To bring or lodge the colours. |

SIGNATURE, a signing of a person's name at the bottom of an act or deed wrote by his own hand.

SIGNATURE, in printing, is a letter put at the bottom of the first page at least, in each sheet, as a direction to the binder in folding, gathering, and collating them. The signatures consist of the capital letters of the alphabet, which change in every sheet: if there be more sheets than letters in the alphabet, to the capital letter is added a small one of the same sort, as A a, B b; which are repeated as often as necessary. In large volumes it is easy to distinguish the number of alphabets, after the first three or four, by placing a figure before the signature, as 5 B, 6 B, &c.

SIGNET, one of the king's seals, made use of in sealing his private letters, and all grants that pass by bill signed under his majesty's hand: it is always in the custody of the secretaries of state.

SIGNET, in Scots law. See Law, N° clvii. 16.

SILENE, *viscosus campion*; a genus of the trigynia order, belonging to the decandria class of plants. The principal species are, Lobel's catch-fly, dwarf lychnis, Spanish campion, Portugal campion, nodding or mountain campion, Persian campion, shrubby Sicilian campion, &c. The two first are annuals, the two next biennials, and the last three perennial in root. They all flower here in summer from May till August, in the different sorts, each flower having five petals; and several of the sorts produce ripe seeds, particularly the annuals and biennials, by which all the sorts may be raised, and the perennials also by parting the roots, &c. They are all hardy herbaceous plants, and in general have very viscid or clammy stalks, particularly just below the joints, to which flies often stick fast; hence the name *catch-fly*, *viscosus*

campion, &c. They will all prosper in any of the garden-compartments.

SILESLIA, a duchy of Germany, bounded on the east by Poland; on the west, by Moravia, Bohemia, Lusatia, and the county of Glatz; on the south, by a chain of mountains, and a thicket of considerable extent, which separates it from Hungary; and to the north, by the mark of Brandenburg. From north-west to south-east it is about 225 miles, and about 100 where broadest: but it is much contracted at both ends. Upon the frontiers of this country, to the west and south, are very high mountains, and some likewise in other parts of it. One of the ridges upon the frontiers is styled the *Riphean Mountains*, another the *Moravian*, another the *Bohemian*, and another the *Hungarian*, *Crapack*, or *Carpathian*. A branch of the Bohemian is called the *Giant Mountains*. The winter on these hilly tracks is more severe, sets in sooner, and lasts longer, than in the low lands. The inhabitants use a kind of skits when the snow is deep, as they do in Carniola. Little or no grain is raised in the mountains and some sandy tracks; but the rest of the country is abundantly fruitful, not only in grain, but fruits, roots, pasture, flax, hops, madder, tobacco, and hemp, yielding also some wine, with considerable quantities of silk and honey. In many places are great woods of pines, fir, beech, larch, and other trees, affording tar, pitch, rosin, turpentine, lamp-black, and timber for all uses. In this country also is found marble of several sorts, some precious stones, limestone, millstone, pit-coal, turf, vitriol, some silver ore, copper, lead, iron, and mineral springs. Great numbers of black cattle and horses are brought hither from Poland and Hungary for sale, those bred in the country not being sufficient; but of sheep, goats, game, and venison, they have great plenty. As for wild-beasts, here are lynxes, foxes, weasels, otters, and beavers. The rivers, lakes, and ponds, yield fish of several sorts, particularly sturgeons several ells in length, and salmon. Besides a number of smaller streams to water this country, there is the Oder, which traverses it almost from one end to the other; and the Vistula, which, after a pretty long course through it, enters Poland. The number of the cities and market-towns is said to be about 200, the county of Glatz included, and that of the villages 5000. The inhabitants, who are computed to be about a million and an half, are a mixture of Germans, Poles, and Moravians. The language generally spoken is German; but in some places the vulgar tongue is a dialect of the Sclavonic. The states consist of the princes and dukes, and those called *state-lords*, with the nobility, who are immediately subject to the sovereign, and the representatives of the chief cities; but since the country fell under the dominion of the king of Prussia, no surtenantage or diets have been held. The king, however, when he took possession of the country, confirmed all the other privileges of the inhabitants. With respect to religion, not only Protestants, but Papists, Jews, and Greeks, enjoy full liberty of conscience. The greatest part of Silesia lies in the diocese of Breslau, but some part of it in the Polish dioceses of Posen and Cracow. The bishop of Breslau stands immediately under the pope with regard to spirituals; but all ecclesiastical benefices, not excepting the see of Breslau, is in the king's gift. Besides Latin schools, col.

Silesia.

colleges, and seminaries, at Breslau is an university, and at Lignitz an academy for martial exercises. The principal manufactures here are woollens, linsens, and cottons of several sorts, with hats, glass-ware, gun-powder, and iron manufactures. Of these there is a considerable exportation. Accounts are generally kept in rix-dollars, silver groschens, and deucaren. With respect to its revolutions and present government, it was long a part of the kingdom of Poland; afterwards it had several dukes and petty princes for its sovereigns, who by degrees became subject to the kings of Bohemia, until at last king Charles IV. incorporated the whole duchy with Bohemia; and thus it continued in the possession of the house of Austria, until the present king of Prussia, taking advantage of the troubles that ensued upon the death of the emperor Charles VI. and pretending a kind of claim, wrested a great part of it, together with the county of Glatz, from his daughter and heiress Maria Theresia, the late empress-dowager; so that now only a small part of it is possessed by the house of Austria, and connected with the empire, the rest being governed by the king of Prussia, without acknowledging any sort of dependence on the crown of Bohemia or the empire. For the administration of justice in all civil, criminal, and feudal cases, and such as relate to the revenue, the king of Prussia has established three supreme judicatories, to which an appeal lies from all the inferior ones, and from which, when the sum exceeds 500 rix-dollars, causes may be moved to Berlin. The Lutheran churches and schools are under the inspection of the upper-consistories, and those of the Papists under that of the bishop's court at Breslau; but from both an appeal lies to the tribunal at Berlin. As to the revenue, the excise here is levied only in the walled towns, being on the same footing as in the mark of Brandenburg; but in the rest of the country the contributions are fixed, and the same both in peace and war. The several branches of the revenue are under the management of the war and domain offices of Breslau and Glogau. The whole revenue arising to the king of Prussia from Silesia and the county of Glatz amounts to about four millions of rix-dollars *per annum*.

Silesia is divided into Upper and Lower, and each of these again into principalities and lordships; of some of which both the property and jurisdiction belong immediately to the sovereign, but of others to his subjects and vassals. In regard to the character of the people, the boors are accounted very dull and silly; but of those of a higher rank, many have distinguished themselves by their wit and learning; as well as by their military and political talents. However, in general, like their neighbours the Germans and Bohemians, they have more of Mars than Mercury in their composition; and their parts are more solid than shining.

SILESIA BARTH, in the materia medica, a fine astringent bole. It is very heavy, of a firm compact texture, and in colour of a brownish yellow. It breaks easily between the fingers, and does not stain the hands; is naturally of a smooth surface, is readily diffusible in water, and melts freely into a butter-like substance in the mouth. It leaves no grittiness between the teeth, and does not ferment with acid menstrua. It is found in the perpendicular fissures of rocks near the gold-mines at Strigonium in Hungary, and is sup-

posed to be impregnated with the sulphur of that metal. It is a good astringent, and better than most of the boles in use.

SILIUS (Italicus Caius), an ancient Roman poet, and author of an epic poem in 17 books, which contains an history of the second Punic war, so famous in history for having decided the empire of the world in favour of the Romans. He was born in the reign of Tiberius, and is supposed to have derived the name of *Italicus* from the place of his birth; but whether he was born at Italica in Spain, or at Cornifium in Italy, which, according to Strabo, had the name of *Italica* given it during the Social war, is a point which cannot be known: though, if his birth had happened at either of these places, the grammarians will tell us, that he should have been called *Italicensis*, and not *Italicus*. When he came to Rome, he applied himself to the bar; and, by a close imitation of Cicero, succeeded so well, that he became a celebrated advocate and most accomplished orator. His merit and character recommended him to the highest offices in the republic, even to the consulship, of which he was possessed when Nero died. He is said to have been aiding and assisting in accusing persons of high rank and fortune, whom that wicked emperor had devoted to destruction: but he retrieved his character afterwards by a long and uniform course of virtuous behaviour. Vespasian sent him as proconsul into Asia, where he behaved with clean hands and unblemished reputation. After having thus spent the best part of his life in the service of his country, he bid adieu to public affairs, resolving to consecrate the remainder to a polite retirement and the muses. He had several fine villas in the country: one at Tusculum, celebrated for having been Cicero's; and a farm near Naples said to have been Virgil's, and at which was his tomb, which Silivius often visited. Thus Martial compliments him on both these accounts:

*Silius hoc magni celebrat monumenta Maronis,
Tugera sacandi qui Ciceronis habet.
Heredem Dominumque sui tumulique larigae
Non alium mallet nec Mara nec Cicero.*

Epigr. 49. Lib. 25.

Of Tully's feat my Silivius is possess'd,
And his the tomb where Virgil's ashes rest.
Could those great shades return to choose their heir,
-The present owner they would both prefer.

In these retirements he applied himself to poetry: led not so much by any great force of genius, which would certainly not have suffered him to stay till life was in the wane and his imagination growing cold, as by his exceeding great love of Virgil, to whose memory he paid the highest veneration. He has imitated him in his poem; and though he falls infinitely short of him, yet he has discovered a great and universal genius, which would enable him to succeed in some degree in whatever he undertook.

Since we know little of Silivius Italicus but what we learn from an epistle of the younger Pliny, we cannot do better than subjoin part of that epistle, as we find it translated by Mr Melmoth; since it will not only confirm all that has been said, but let the reader into some farther particulars concerning him.

"I am just now informed, that Silivius Italicus has starved himself to death, at his villa near Naples. Having been afflicted with an imposthume, which was deemed incurable, he grew weary of life under such un-

Silius,
Silk.

easy circumstances, and therefore put an end to it with the most determined courage. He had been extremely fortunate through the whole course of his days, excepting only the loss of his younger son; however, that was made up to him in the satisfaction of seeing his eldest, who is of a more amiable character, attain the consular dignity, and of leaving him in a very flourishing situation. He suffered a little in his reputation in the time of Nero, having been suspected of forwardly joining in some of the informations which were carried on in the reign of that prince; but he made use of his interest in Vitellius with great discretion and humanity. He acquired much honour by his administration of the government of Asia; and by his approved behaviour after his retirement from business, cleared his character from that stain which his former intrigues had thrown upon it. He lived among the nobility of Rome without power, and consequently without envy. Though he frequently was confined to his bed, and always to his chamber, yet he was highly respected and much visited; not with a view to his wealth, but merely on account of his merit. He employed his time between conversing with men of letters and composing of verses; which he sometimes recited, in order to try the sentiments of the public; but he discovered in them more industry than genius. In the decline of his years he entirely quitted Rome, and lived altogether in Campania, from whence even the accession of the new emperor (Trajan) could not draw him. A circumstance which I mention, as well to the honour of the prince, who was not displeased with that liberty, as of Italicus, who was not afraid to make use of it. He was reproached with being fond of all the elegancies of the fine arts to a degree of excess. He had several villas in the same province; and the last purchase was always the chief favourite, to the neglect of the rest. They were all furnished with large collections of books, statues, and pictures, which he more than enjoyed, he even adored; particularly that of Virgil, of whom he was so passionate an admirer, that he celebrated the anniversary of that poet's birth-day with more solemnity than his own; especially at Naples, where he used to approach his tomb with as much reverence as if it had been a temple. In this tranquillity he lived to the 75th year of his age, with a delicate rather than a sickly constitution. It is remarkable, that as he was the last person upon whom Nero conferred the consular office (that prince being killed during his consulship), so he was the last also that survived of all those who had been raised by him to that dignity. When I consider this, I cannot forbear lamenting the transitory condition of mankind. Is there any thing in nature so short and limited as human life even in its most extended period? Does it not seem to you, my friend, but yesterday that Nero was upon the throne? and yet none of all those who were consuls in his reign now remain!"

There have been many editions of Silius Italicus. A neat and correct one was published at Leipzig, 1696, in 8vo, with short and useful notes by Cellarius: but the best is that *cum notis integris variorum & Arnoldi Drakenborch. Trajecti. ad Rhen. 1717*, in 4to.

SILK, is properly an animal fluid, hardened by the air; being an extremely soft and glossy thread, spun by the silk-worm. See SILK-WORM.

Silk.

As soon as the animal is arrived at the size and strength necessary for beginning his cod, he makes his web; for it is thus they call that slight tissue which is the beginning and ground of this admirable work. This is his first day's employment. On the second he forms his folliculus or ball, and covers himself almost over with silk. The third day he is quite hid; and the following days employs himself in thickening and strengthening his ball: always working from one single end, which he never breaks by his own fault; and which is so fine, and so long, that those who have examined it attentively think they speak within compass, when they affirm, that each ball contains silk enough to reach the length of six English miles.

In ten days time the ball is in its perfection, and is now to be taken down from the branches of the mulberry-tree, where the worms have hung it. But this point requires a deal of attention: for there are some worms more lazy than others; and it is very dangerous waiting till they make themselves a passage, which usually happens about the fifteenth day of the month.

The first, finest, and strongest balls are kept for the grain, the rest are carefully wound; or if it is desired to keep them all, or if there be more than can be well wound at once, they lay them for some time in an oven moderately hot, or else expose them for several days successively to the greatest heats of the sun, in order to kill the insect, which, without this precaution, would not fail to open itself a way to go and use those new wings abroad it has acquired within.

Ordinarily, they only wind the more perfect balls; those that are double, or too weak, or too coarse, are laid aside, not as altogether useless, but that, being improper for winding, they are referred to be drawn out into skeins. The balls are of different colours; the most common are yellow, orange-colour, isabella, and flesh-colour; there are some also of a sea-green, others of a sulphur colour, and others white; but there is no necessity for separating the colours and shades to wind them apart, as all the colours are to be lost in the future scouring and preparing of the silk.

To wind silks from off the balls, two machines are necessary, the one a furnace, with its copper; the other a reel, or frame, to draw the silk. The winder, then, seated near the furnace, throws into the copper of water over the furnace (first heated and boiled to a certain degree, which custom alone can teach) a handful or two of balls, which have been first well purged of all their loose furry substance. She then stirs the whole very briskly about with birchen rods, bound and cut like brushes; and when the heat and agitation have detached the ends of the silks of the pods, which are apt to catch on the rods, she draws them forth; and joining ten or twelve, or even fourteen of them together, she forms them into threads, according to the bigness required to the works they are destined for: eight ends sufficing for ribbands; and velvets, &c. requiring no less than fourteen. The ends, thus joined into two or three threads, are first passed into the holes of three iron rods in the fore-part of the reel, then upon the bobbins or pullies, and at last are drawn out to the reel itself, and there fastened each to

Silk.

an end of an arm or branch of the reel. Thus disposed, the winder, giving motion to the reel, by turning the handle, guides the threads; substitutes new ones, when any of them break, or any of the balls are wound out; strengthens them, where necessary, by adding others; and takes away the balls wound out, or that, having been pierced, are full of water.

In this manner, two persons will spin and reel three pounds of silk in a day; which is done with greater dispatch than is made by the spinning-wheel or distaff. Indeed, all silks cannot be spun and reeled after this manner; either by reason the balls have been perforated by the silk-worms themselves; or because they are double, or too weak to bear the water; or because they are coarse, &c. Of all these together, they make a particular kind of silk, called *floretta*; which being carded, or even spun on the distaff or the wheel, in the condition it comes from the ball, makes a tolerable silk.

As to the balls, after opening them with scissars, and taking out the insects, (which are of some use for the feeding of poultry), they are steeped three or four days in troughs, the water whereof is changed every day to prevent their sinking. When they are well softened by this scouring, and cleared of that gummy matter the worm had lined the inside withal, and which renders it impenetrable to the water, and even to air itself, they boil them half an hour in a lye of ashes, very clear and well strained; and after washing them out in the river, and drying them in the sun, they card and spin them on the wheel, &c. and thus make another kind of *floretta*, somewhat inferior to the former.

As to the spinning and reeling of raw silks off the balls, such as they are brought from Italy and the Levant, the first is chiefly performed on the spinning-wheel; and the latter, either on hand-reels, or on reels mounted on machines, which serve to reel several skains at the same time.

Dyeing of Silk Black. To the general directions given under the article DYEING, n° 17. we shall here add a particular receipt from Dr Lewis's Commerce of Arts. "The silk," says he, "washed as above directed *, is steeped in a decoction of one-third its weight of Aleppo or blue galls, or half its weight of the weaker white galls of Sicily and Romania, and afterwards washed with water; every 12 ounces are reduced by the cleansing to 9, which ought to be increased by the galling to 11, and no more. The dyeing liquor for 100 lb. of silk is prepared by boiling 20 pounds of galls in a sufficient quantity of water, (about 126 gallons), and adding to this decoction, after being settled and drawn off from the sediment, two pounds and an half of English vitriol, 12 pounds of iron-filings, and 20 pounds of the gum of the cherry or plum tree: that the gum may dissolve the more readily, it is put into a large copper cullender, immersed in the hot liquor, and stirred and worked from time to time with a wooden rod till it is all passed through. This mixture is kept for six or seven days or more, a circumstance supposed to be necessary for its perfection; and being then made as hot as the hand can bear, fresh parcels of the galled silks are dipped in it successively, and kept in about 10 minutes each. All of them, after being aired, are dipped again fe-

veral times, with the addition of more vitriol and iron-filings, till they have acquired the requisite blackness, after which they are well washed in water."

This is the process which Mr Macquer tells us is followed in the manufactories at Tours and Genes; on which Dr Lewis makes the following remarks. Having repeated the process in small, with each of the articles exactly in the proportions above-mentioned, he found that it required 30 dippings, or more, to produce a good colour. With less than half this number the silk appears of a beautiful black when taken out of the liquor; but by washing, it becomes pale, and still more so by drying. The quantity of vitriol used, in all, was about eight times that recommended above to be added at one time, or one-fifth part of the weight of the silk; but the iron-filings put in at first remaining undissolved, it was not thought needful to add any more of this ingredient. The operation being repeated without iron-filings at all, no difference could be perceived between the two colours. Without the gum there was a very considerable difference in the silk as taken out of the dye; that which had been dyed with gum having a fine glossiness which the other wanted: the subsequent washing, however, destroyed that glossiness, so that the gum seemed to be of no service, but rather detriment, by thickening the liquor, and making it penetrate with more difficulty into the silk, in the same manner as it prevents ink from sinking into paper. Some silk dyed in the same manner as woollen cloth *, turned out a rusty black when the silk was put in white, but very good when the silk had been previously dyed blue.

Silk-Worm. This insect consists of 11 rings, and each of these of a great number of other smaller ones, joined to each other; and the head, which terminates these rings, is furnished with two jaws, which work and cut the food, not by a perpendicular but a lateral action. The humours found in the body of this creature, all seem approaching to the nature of the silk which it spins, for on being rubbed in the hands they leave a hard or solid crust behind them. Under the skin there is always found a mucous rosy-coloured membrane, enveloping the animal, and supposed to be the new skin in which it is to appear on throwing off the old one. The heart of this creature reaches from the head to the tail, running the whole length of the body: it is indeed rather a series of many hearts connected together, than one. The motion of systole and diastole is very evident in this whole chain of hearts; and it is an elegant sight to observe the manner of the vital fluids passing from one of them to the other. The stomach of this animal is as long as the heart, reaching, like it, from one end of the body to the other. This large receptacle for food, and the sudden passage of it through the animal, are very good reasons for its great voracity.—In the sides of the belly, all about the ventricle, there are deposited a vast number of vessels which contain the silky juice; these run with various windings and meanders to the mouth, and are so disposed that the creatures can discharge their contents at pleasure at the mouth; and, according to the nature of the juices that they are supplied with, furnish different sorts of silk from them, all the fluid contents of these vessels hardening in the air into that sort of thread that we find the web or balls of this.

Silk.

* See the last article.

Silphium
||
Simeon.

this creature consist of. These creatures never are offended at any stench, of whatever kind; but they always feel a southern wind, and an extremely hot air always make them sick.

SILPHIUM, *BASTARD CHRYSANTHEMUM*; a genus of the polygamia necessaria order, belonging to the syngenesia class of plants. There are six species; all of them herbaceous perennials, rising from three to nine feet high, with compound radiated flowers of a yellow colour. They are all very hardy, and easily propagated by parting their roots in autumn.

SILVER, called *luna* by the chemists, a perfect metal of a shining white colour. See *CHEMISTRY*, n° 140, 195, 238, 363. See also *METALLURGY*, p. 4924, *et seq.*

Shell-SILVER, is prepared of the shreds of silver-leaf or of the leaves themselves, for the use of painters, after the same manner as shell-gold. See *Shell-GOLD*.

SILVERING, the covering of any thing with silver. It is usual to silver metals, wood, paper, &c. which is performed either with fire, oil, or size. Metal-gilders silver by the fire; painter-gilders all the other ways. See *GILDING*.

To silver copper or brass. 1. Cleanse the metal with aquafortis, by washing it lightly, and immediately throwing it into fair water; or by heating it red-hot, and scouring it with salt and tartar and fair water, with a small wire brush. 2. Dissolve some silver in aquafortis, in a broad-bottomed glass vessel, or of glazed earth; then evaporate away the aquafortis over a chaffing-dish of coals. 3. Put five or six times its quantity of water, or as much as will be necessary to dissolve it perfectly, on the remaining dry calx; evaporate this water with the like heat; then put more fresh water, and evaporate again; and, if need be, the third time, making the fire towards the latter end so strong, as to leave the calx perfectly dry, which, if your silver is good, will be of a pure white. 4. Take of this calx, common salt, crystal of tartar, of each a like quantity or bulk, and mixing well the whole composition, put the metal into fair water, and take of the said powder with your wet fingers, and rub it well on, till you find every little cavity of the metal sufficiently silvered over. 5. If you would have it richly done, you must rub on more of the powder, and in the last place wash the silvered metal in fair water, and rub it hard with a dry cloth.

SILVERING of Glasses. See *FOLIATING of Looking-glasses*.

SILURUS, in ichthyology, a genus belonging to the order of pisces abdominales. The head is naked; the mouth set round with hairy filaments; the branchiæ have from 4 to 14 rays; the ray of the pectoral fins, or the first dorsal one, is prickly, and dentated backwards. There are 21 species, most of them natives of the Indian and American seas. Mr Hasselquist mentions one called the *clarias* by Linnaeus, and *scheilan* by the Arabians. If it pricks one with the bone of the breast-fin, it is dangerous; and our author saw the cook of a Swedish merchant-ship die of the poison communicated by the prick of one of these fish.

SIMEON of *DURHAM*, the cotemporary of William of Malmibury, took great pains in collecting the monuments of our history, especially in the north of England, after they had been scattered by the Danes.

From these he composed a history of the kings of England, from A. D. 616 to 1130; with some smaller historical pieces. Simeon both studied and taught the sciences, and particularly the mathematics at Oxford; and became precentor of the church at Durham, where he died, probably soon after the conclusion of his history, which was continued by John, prior of Hexham, to A. D. 1156.

SIMIA, the *MONKEY*; a genus of quadrupeds, belonging to the order of primates. They have four fore-teeth in each jaw, placed near each other: the dog-teeth are solitary and more remote; and the grinders are obtuse. They are a numerous race; but almost all confined to the torrid zone. They fill the woods of Africa, from Senegal to the Cape, and from thence to Æthiopia: they are found in all parts of India, and its islands; in Cochinchina, in the south of China, and in Japan; (and one is met with in Arabia): and they swarm in the forests of South America, from the isthmus of Darien, as far as Paraguay. They are lively, agile, full of frolic, chatter, and grimace. From the structure of their members, they have many actions in common with the human kind. Most of them are fierce and untamable: some are of a milder nature, and will show a degree of attachment; but in general, they are endowed with mischievous intellects; and are filthy, obscene, lascivious, thieving. They inhabit the woods, and live in trees; feeding on fruits, leaves, and insects. In general, they are gregarious, going in vast companies: but the different species never mix with each other, always keeping apart and in different quarters. They leap with vast activity from tree to tree, even when loaded with their young, which cling to them. They are the prey of leopards and others of the feline race; and of serpents, which pursue them to the summit of the trees, and swallow them entire. They are not carnivorous, but for mischief's sake will rob the nests of birds of the eggs and young: in the countries where they most abound, the sagacity of the feathered tribe is more marvellously shown in their contrivances to fix the net beyond the reach of these invaders. See *MOTACILLA*.

The simiæ being more numerous in their species than any other animals, and differing greatly in their appearances, it seemed necessary to methodize and subdivide the genus. Accordingly Mr Ray first distributed them into three classes:

Simiæ, Apes, such as wanted tails.

Cercopithecii, Monkeys, such as had tails.

Papiones, Baboons, those with short tails: to distinguish them from the common monkeys, which have very long ones.

From Ray's method, Linnaeus formed his. M. de Buffon followed the same; but with a subdivision of the long-tailed apes, or the true monkeys, into such which had prehensile tails, and such which had not. Mr Pennant has adopted the same method; but is more definite as to the class of baboons, in which he comprehends all whose tails do not exceed half the length of their bodies, and are carried in an arched direction. According to those divisions, the following are the principal species:

I. Without tails; the true *APES*.

1. The *fatyrus*, orang outang, or great ape, has a flat face, and a deformed resemblance of the human;

Simia.

ears exactly like those of a man; the hair on the head longer than on the body. The body and limbs are covered with reddish and shaggy hair; longest on the back, thinnest on the fore-parts. The face and paws are swarthy; the buttocks covered with hair. They inhabit the interior parts of Africa, the isles of Sumatra, Borneo, and Java. Are solitary, and live in the most desert places. They grow to the height of six feet: have prodigious strength, and will overpower the strongest man. The old ones are shot with arrows, the young alone can be taken alive. They live entirely on fruits and nuts. They will attack and kill the negroes who wander in the woods; will drive away the elephants, and beat them with their fists or pieces of wood; and will throw stones at people that offend them. They sleep in trees; and make a sort of shelter from the inclemency of the weather. They are of a grave appearance and melancholy disposition, and even when young not inclined to frolic. They go erect, and are vally swift and agile. These accounts are chiefly taken from Andrew Battel, an English sailor, who was taken prisoner 1589, and lived many years in the inner parts of Congo; his narrative is plain, and seems very authentic: it is preserved in Purchas's collection.

* *Descript. Historique du royaume de Maroc*, p. 51.
Froger * informs us, "that those along the banks of the river Ganges are larger and more mischievous than in any part of Africa: the negroes dread them, and cannot travel alone in the country, without running the hazard of being attacked by these animals, who often present them with a stick, and force them to fight. I have heard the Portuguese say, that they have often seen them hoit up young girls, about seven or eight years old, into trees, and that they could not be wrested from them without a great deal of difficulty. The most part of the negroes imagine them to be a foreign nation come to inhabit their country, and that they do not speak for fear of being compelled to work." When taken young, they are capable of being tamed, and taught to perform many menial offices. Francis Pyrand † relates, "that in the province of Sierra

† *Voyages de François Pyrand*, tom. ii. p. 331.

‡ *Enf. Nicremberg. Hist. Nat. peregrin.* lib. ix. cap. 45.
§ *Voyages de Fr. le Guat.* tom. ii. p. 96.

Leona, there is a species so strong-limbed, and so indolent, that, when properly trained and fed, they work like servants; that they generally walk on the two hind-feet; that they pound any substances in a mortar; that they go to bring water from the river in small pitchers, which they carry full on their heads. But when they arrive at the door, if the pitchers are not soon taken off, they allow them to fall; and when they perceive the pitchers overturned and broken, they weep and lament." Father Jarric†, quoted by Nicremberg, says the same thing, nearly in the same terms. With regard to the education of these animals, the testimony of Schoutten ‡ accords with that of Pyrand. "They are taken (he remarks) with snares, taught to walk on their hind-feet, and to use their fore-feet as hands in performing different operations, as rinsing glasses, carrying drink round the company, turning a spit, &c." "I saw at Java, (says Guat) §, a very extraordinary ape. It was a female. She was very tall, and often walked erect on her hind-feet. On these occasions, she concealed with her hands the parts which distinguish the sex. Except the eye-brows, there was

no hair on her face, which pretty much resembled the grotesque female faces I saw among the Hottentots at the Cape. She made her bed very neatly every day, lay upon her side, and covered herself with the bed-cloaths. When her head ached, she bound it up with a handkerchief; and it was amusing to see her thus hooded in bed. I could relate many other little articles which appeared to me extremely singular. But I admired them not so much as the multitude; because as I knew the design of bringing her to Europe to be exhibited as a show, I was inclined to think that she had been taught many of these monkey-tricks, which the people considered as being natural to the animal. She died in our ship, about the latitude of the Cape of Good Hope. The figure of this ape had a very great resemblance to that of man, &c." Gemelli Carreri tells us, that he saw one of these apes, which cried like an infant, walked upon its hind-feet, and carried a mat under its arm to lie down and sleep upon.

An orang-outang which Buffon saw, is described by him as mild, affectionate, and good-natured. His air was melancholy, his gait grave, his movements measured, his dispositions gentle, and very different from those of other apes. He had neither the impatience of the Barbary ape, the maliciousness of the baboon, nor the extravagance of the monkeys. "It may be alleged, (says our author), that he had the benefit of instruction; but the other apes which I shall compare with him, were educated in the same manner. Signs and words were alone sufficient to make our orang-outang act: but the baboon required a cudgel, and the other apes a whip; for none of them would obey without blows. I have seen this animal present his hand to conduct the people who came to visit him, and walk as gravely along with them as if he had formed a part of the company. I have seen him sit down at table, unfold his towel, wipe his lips, use a spoon or a fork to carry the victuals to his mouth, pour his liquor into a glass, and make it touch that of the person who drank along with him. When invited to take tea, he brought a cup and saucer, placed them on the table, put in sugar, poured out the tea, and allowed it to cool before he drank it. All these actions he performed without any other instigation than the signs or verbal orders of his master, and often of his own accord. He did no injury to any person: he even approached company with circumspection, and presented himself as if he wanted to be caressed. He was very fond of dainties, which every body gave him: And as his breath was diseased, and he was afflicted with a teasing cough, this quantity of sweetsmeats undoubtedly contributed to shorten his life. He lived one summer in Paris, and died in London the following winter. He ate almost every thing; but preferred ripe and dried fruits to all other kinds of food. He drank a little wine; but spontaneously left it for milk, tea, or other mild liquors." This was only two feet four inches high, and was a young one. There is great possibility that these animals may vary in size and in colour, some being covered with black, others with reddish hairs.—They are not the satyrs of the ancients; which had tails (A), and were a species of monkey. Linnaeus's

Homo

(A) Ælian gives them tails, lib.

Pliny says they have teeth like dogs, lib. vii. c. 2. circumstances common to many monkeys. Ptolemy, lib. vii. c. 2. speaks of certain islands in the Indian ocean, inhabited by people with.

Simia.

Simia. *homo nocturnus*, an animal of this kind, is unnecessarily separated from his *simia satyrus*.

CCLXVIII
&c. fig. 1.

To enable the reader to form a judgment of this animal which has so great a resemblance to man, it may not be unacceptable to quote from Buffon the differences and conformities which make him approach or recede from the human species. "He differs from man externally by the flatness of his nose, by the shortness of his front, and by his chin, which is not elevated at the base. His ears are proportionally too large, his eyes too near each other, and the distance between his nose and mouth is too great. These are the only differences between the face of an orang-outang and that of a man. With regard to the body and members, the thighs are proportionally too short, the arms too long, the fingers too small, the palm of the hands too long and narrow, and the feet rather resemble hands than the human foot. The male organs of generation differ not from those of man, except that the prepuce has no frænum. The female organs are extremely similar to those of a woman.

"The orang-outang differs internally from the human species in the number of ribs: man has only 12; but the orang-outang has 13. The vertebrae of the neck are also shorter, the bones of the pelvis narrow, the buttocks flatter, and the orbits of the eyes sunk deeper. He has no spinal process on the first vertebra of the neck. The kidneys are rounder than those of man, and the ureters have a different figure, as well as the bladder and gall-bladder, which are narrower and longer than in the human species. All the other parts of the body, head, and members, both external and internal, so perfectly resemble those of man, that we cannot make the comparison without being astonished that such a similarity in structure and organization should not produce the same effects. The tongue, and all the organs of speech, for example, are the same as in man; and yet the orang-outang enjoys not the faculty of speaking; the brain has the same figure and proportions; and yet he possesses not the power of thinking. Can there be a more evident proof than is exhibited in the orang-outang, that matter alone, though perfectly organized, can produce neither language nor thought, unless it be animated by a superior principle? Man and the orang-outang are the only animals who have buttocks and the callus of the legs, and who, of course, are formed for walking erect; the only animals who have a broad chest, flat shoulders, and vertebrae of the same structure; and the only animals whose brain, heart, lungs, liver, spleen, stomach, and intestines, are perfectly similar, and who have an appendix vermiformis, or blind-gut. In fine, the orang-outang has a greater resemblance to man than even to the baboons or monkeys, not only in all the parts we have mentioned, but in the largeness of the face, the figure of the cranium, of the jaws, of the teeth, and of the other bones of the head and face; in the thickness of the fingers and thumb, the figure of the nails, and the number of vertebrae; and, lastly, in the conformity of the articulations, the magnitude and figure of the rotula, sternum, &c. Hence, as there is a greater similarity between this animal and man, than between those

creatures which resemble him most, as the Barbary ape, the baboon, and monkey, who have all been designated by the general name of *apes*, the Indians are to be excused for associating him with the human species, under the denomination of *orang-outang*, or *wild man*. In fine, if there were a scale by which we could descend from human nature to that of the brutes, and if the essence of this nature consisted entirely in the form of the body, and depended on its organization, the orang-outang would approach nearer to man than any other animal. Placed in the second rank of beings, he would make the other animals feel his superiority, and oblige them to obey him. If the principle of imitation, by which he seems to mimic human actions, were a result of thought, this ape would be still farther removed from the brutes, and have a greater affinity to man. But the interval which separates them is immense. Mind, reflection, and language, depend not on figure or the organization of the body. These are endowments peculiar to man. The orang-outang, though, as we have seen, he has a body, members, senses, a brain, and a tongue, perfectly similar to those of man, neither speaks nor thinks. Though he counterfeits every human movement, he performs no action that is characteristic of man, no action that has the same principle or the same design. With regard to imitation, which appears to be the most striking character of the ape-kind, and which the vulgar have attributed to him as a peculiar talent, before we decide, it is necessary to inquire whether this imitation be spontaneous or forced. Does the ape imitate us from inclination, or because, without any exertion of the will, he feels the capacity of doing it? I appeal to all those who have examined this animal without prejudice; and I am convinced that they will agree with me, that there is nothing voluntary in this imitation. The ape, having arms and hands, uses them as we do, but without thinking of us. The similarity of his members and organs necessarily produces movements, and sometimes successions of movements, which resemble ours. Being endowed with the human structure, the ape must move like man; but the same motions imply not that he acts from imitation. Two bodies which receive the same impulse, two similar pendulums or machines, will move in the same manner; but these bodies or machines can never be said to imitate each other in their motions. The ape and the human body are two machines similarly constructed, and necessarily move nearly in the same manner; but parity is not imitation. The one depends on matter and the other on mind. Imitation presupposes the design of imitating. The ape is incapable of forming this design, which requires a train of thinking: consequently, man, if he inclines, can imitate the ape; but the ape cannot even incline to imitate man."

2. The sylvanus, or pigmy, has a flattish face; ears Fig. 2. like those of a man; body, of the size of a cat; colour above, of an olive brown; beneath, yellowish; nails flat; buttocks naked. Sits upright. Inhabits Africa. This species is not uncommon in our exhibitions of animals; and is very tractable and good-natured. Most probably the Pigmy of the ancients. They abound in

Ethiopia,

with tails like those with which satyrs are painted, whence called the *istes of satyrs*. Kæping, a Swede, pretended to have discovered these *homines caudati*; that they would have trafficked with him, offering him live parrots; that afterwards they killed some of the crew that went on shore, and eat them, &c. &c. *Amer. Acad. vi.* 71.

Simia.

Simia. Ethiopia, one feat of that imaginary nation. They were believed to dwell near the fountains of the Nile: they defended annually to make war on the cranes, *i. e.* to steal their eggs, which the birds may be supposed naturally to defend; whence the fiction of their combats. Strabo judiciously observes, that no person worthy of credit ever ventured to assert that he had ever seen this nation. Aristotle speaks of them only by hearsay: they were said to be mounted on little horses, on goats, on rams, and even on partridges. The Indians, taking advantage of the credulity of people, embalmed this species of ape with spices, and sold them to merchants as true pigmies*: such doubtless, were the diminutive inhabitants mentioned by Mr Grose† to be found in the forests of the Carnatic. They feed on fruits: are very fond of insects, particularly of ants; assembling in troops, and turning over every stone in search of them. If attacked by wild beasts, they take to flight; but if overtaken, will face their pursuers, and, by flinging the subtle sand of the desert in their eyes, often escape.

Fig. 3.

3. The gibbon, or long-armed ape, with a flat swarthy face surrounded with grey hairs: hair on the body black and rough: buttocks bare: nails on the hands flat; on the feet, long: arms of a most disproportioned length, reaching quite to the ground when the animal is erect, its natural posture: of a hideous deformity.—Inhabits India, Malacca, and the Molucca isles: a mild and gentle animal: grows to the height of four feet. The great black ape of Mangfi, a province in China, seems to be of this kind.

Fig. 4.

4. The inuus, magot, or Barbary ape, has a long face, not unlike that of a dog: canine teeth, long and strong: ears like the human: nails flat: buttocks bare: colour of the upper part of the body, a dirty greenish brown; belly, of a dull pale yellow: grows to above the length of four feet.—They inhabit many parts of India, Arabia, and all parts of Africa except Egypt, where none of this genus are found. A few are found on the hill of Gibraltar, which breed there: probably from a pair that had escaped from the town; as they are not found in any other part of Spain.—They are very ill-natured, mischievous, and fierce; agreeing with the character of the ancient Cynocephali. They are a very common kind in exhibitions. By force of discipline, are made to play some tricks; otherwise, they are more dull and sullen than the rest of this genus. They assemble in great troops in the open fields in India; and will attack women going to market, and take their provisions from them. The females carry the young in their arms, and will leap from tree to tree with them.—Apes were worshipped in India, and had magnificent temples erected to them. When the Portuguese plundered one in Ceylon, they found in a little golden casket (a) the tooth of an ape; a relic held by the natives in such veneration, that they offered 700,000 ducats to redeem it, but in vain; for it was burnt by the viceroy, to stop the progress of idolatry.

Fig. 5.

5. The tufted ape, a species of most disgusting deformity, described in the Philosophical Transactions, abridged, N° 290. It had a nose and head 14 inches in length: the nose of a deep red, face blue, both na-

VOL. X.

I

ked; black eye-brows; ears like the human: on the top of the head a long upright tuft of hair; on the chin another; two long tusks in the upper jaw: on the feet exactly resembling hands, and the nails on the fingers flat: the fore-part of the body, and the inside of the legs and arms, naked: the outside covered with mottled brown and olive hair. Length, from the nose to the rump, three feet two inches. It was very fierce and salacious: went on all-fours; but would sit up on its rump, and support itself with a stick: in this attitude, it would hold a cup in its hand, and drink out of it. Its food was fruits.

II. BABOONS. A. With short tails.

6. The *Spynx*, or great baboon, with hazel irides; Fig. 6. ears small and naked; face canine, and very thick; middle of the face and fore-head naked, and of a bright vermilion colour; tip of the nose of the same, and ending trincated like that of a hog; sides of the nose broadly ribbed, and of a fine violet hue; the opening of the mouth very small; cheeks, throat, and goat-like beard yellow; hair on the fore-head very long, turns back, is black, and forms a kind of pointed crest. Head, arms, and legs, covered with short hair, yellow and black intermixed; the breast with long whitish yellow hairs, the shoulders with long brown hair. Nails flat; feet and hands black; tail four inches long, and very hairy: buttocks bare, red, and filthy; but the space about them is of a most elegant purple colour, which reaches to the inside of the upper part of the thighs.

This was described by Mr Pennant from a stuffed specimen in Sir Ashton Lever's museum. In August 1779, a live animal of this species was shown at Edinburgh, and in October following at Chester, where being seen by Mr Pennant, that inquisitive naturalist has described it in his History of Quadrupeds. "It differed little (he observes) in colour from the above, being in general much darker. Eyes much sunk in the head, and small. On the internal side of each ear was a white line, pointing upwards. The hair on the fore-head turned up like a toupee. Feet black; in other respects resembled the former. In this I had an opportunity of examining the teeth. The cutting teeth were like those of the rest of the genus; but, in the upper and lower jaw, were two canine, or rather tusks, near three inches long, and exceedingly sharp and pointed. This animal was five feet high, of a most tremendous strength in all its parts; was excessively fierce, libidinous, and strong.

Mr Schreber says, that this species lives on succulent fruits, and on nuts; is very fond of eggs, and will put eight at once into its pouches, and, taking them out one by one, break them at the end, and swallow the yolk and white: rejects all flesh-meat, unless it be dressed: would drink quantities of wine or brandy: was less agile than other baboons: very cleanly; for it would immediately fling its excrements out of its but. That which was shown at Chester was particularly fond of cheese. Its voice was a kind of roar, not unlike that of a lion, but low and somewhat inward. It went upon all-fours, and never stood on its hind-legs, unless forced by the keeper; but would frequently sit on its rump in a crouching man-

(a) *Linschotten's Voy.* 53. In Amadabat are hospitals for apes and other maimed animals; *Tavernier's Voy.* part II. 48. The same writer says, that they breed in great numbers in India, in the copes of bamboos, which grow on each side the road, p. 94.

Simia.
Baboons.
Fig. 7.

ner, and drop its arms before the belly. Inhabits the hotter parts of Africa."

7. The wood-baboon, with a long dog-like face, covered with a small glossy black skin; hands and feet naked, and black like the face; hair on all parts long, elegantly mottled with black and tawny; nails white. About three feet high when erect; tail not three inches, and very hairy on the upper part.—Inhabits Guiney, where it is called the *man of the wood*.

8. The nemeſtrina, or pig-tail baboon, with a pointed face, which is naked, of a swarthy redness: two sharp canine teeth: ears like the human: hair on the limbs and body brown inclining to ash-colour, palest on the belly; fingers black: nails long and flat: thumbs on the hind-feet very long, connected to the nearest toe by a broad membrane: tail four inches long, slender, exactly like a pig's, and almost naked; the bare spaces on the rump red, and but small: length, from head to tail, 22 inches. Inhabits the isles of Sumatra and Japan: is very docile. In Japan it is taught several tricks, and carried about the country by mountebanks. Kempfer was informed by one of these people, that the baboon he had was 102 years old.

B. Baboons with longer tails.

9. The hamadryas, or dog-faced baboon, with a long, thick, and strong nose, covered with a smooth red skin: ears pointed, and hid in the hair: head great, and flat: hair on the head, and fore-part of the body as far as the waist, very long and shaggy; grey and olive-brinded; the sides of the head very full, the hair on the limbs and hind-part of the body very short: limbs strong and thick: hands and feet dusky: the nails on the fore-feet flat; those on the hind like a dog's: buttocks very bare, and covered with a skin of a bloody colour: tail scarce the length of the body, and carried generally erect. They inhabit the hottest parts of Africa and Asia; where they keep in vast troops, and are very fierce and dangerous. They rob gardens. They will run up trees when passengers go by, shake the boughs at them with great fury, and chatter very loud. They are excessively impudent, indecent, lascivious: most detestable animals in their manners as well as appearance. They range the woods in hundreds; which obliges the owners of the coffee-plantations to be continually on their guard against their depredations. One of them was shown in London some years ago: it came from Mokka, in the province of Yeman, in Arabia Felix in the Persian gulph; and was above five feet high. It was very fierce, and untamable; so strong, as easily to mangle its keeper, a stout young man. Its inclinations to women appeared in the most violent manner. A footman, who brought a girl to see it, in order to tease the animal, kissed and hugged her: The beast, enraged at being so tantalized, caught hold of a quart pewter-pot, which he threw with such force and so sure an aim, that, had not the man's hat and wig softened the blow, his skull must have been fractured; but he fortunately escaped with a common broken head.

10. The faunus, silenus, or lion-tailed baboon, with a dog-like face, naked, and of a dusky colour: a very large and full white or hoary beard: large canine teeth: body covered with black hair; belly of a light-colour: tail terminated with a tuft of hair like that of a lion.

Its bulk that of a middling sized dog. It inhabits the East-Indies and the hotter parts of Africa.

III. With tails longer than their bodies, or MONKEYS.

A. Those of the old world, or the continent of Asia and Africa, having within each lower jaw pouches for the reception of their food: buttocks generally naked.

A. Tails straight, not prehensile.

11. The purple-faced monkey, with a great triangular white beard, short, and pointed at the bottom and on each side of the ears, extending in a winged fashion far beyond them; face and hands purple, body black. Inhabit Ceylon. They are very harmless; live in the woods, and feed on leaves and buds of trees; and when taken soon become tame.

12. The fabaz, or green monkey, has a black and flattish face: the side of it bounded by long white hairs, falling backwards, and almost covering the ears, which are black, and like the human: head, limbs, and whole upper part of the body and tail, covered with soft hair, of a yellowish green colour at their ends, cinereous at their roots: under-side of the body and tail, and inner side of the limbs, of a silvery colour: tail very long and slender. Size of a small cat.—Inhabit different parts of Africa: keep in great flocks, and live in the woods: are scarce discernible when among the leaves, except by their breaking the boughs with their gambols: in which they are very agile and silent: even when shot at, do not make the least noise; but will unite in company, knit their brows, and gnash their teeth, as if they meant to attack the enemy: are very common in the Cape Verd islands.

13. The æthiops, mangaby, or white-eyed monkey, Fig. 10. has a long, black, naked, and dog-like face: the upper eye-lids of a pure white: ears black, and like the human: no canine teeth: hairs on the sides of the face beneath the cheeks, longer than the rest: tail long: colour of the whole body tawny and black: flat nails on the thumbs and fore-fingers; blunt claws on the others: hands and feet black.—Shown in London some years ago: place uncertain: that described by M. de Buffon came from Madagascar; was very good-natured; went on all-fours.

14. The aygula, or egret monkey, has a long face, Fig. 12. and an upright sharp-pointed tuft of hair on the top of the head. The hair on the fore-head is black; the tuft, and the upper part of the body, light grey; the belly, white: the eye-brows are large; the beard very small. Size of a small cat. They inhabit Java. They fawn on men, on their own species, and embrace each other. They play with dogs, if they have none of their own species with them. If they see a monkey of another kind, they greet him with a thousand grimaces. When a number of them sleep, they put their heads together. They make a continual noise during night.

15. The Chinese monkey, (*le bonnet Chinois* of Buffon), has a long smooth nose, of a whitish colour: hair on the crown of the head long, lying flat, and parted like that of a man; colour, a pale cinereous brown. Inhabit Ceylon. They keep in great troops; and rob the gardens of fruit, and fields of the corn; to prevent which, the natives are obliged to watch the whole day: yet these animals are so bold, that, when driven from one end of the field, they will immediately enter at the other.

Fig. 11.

Fig. 8.

Fig. 9.

Simia.

MONKEYS

Simia. other, and carry off with them as much as their mouth
MONKEYS. and arms can hold. Bosman, speaking of the thefts
of the monkeys of Guiney, says, that they will take in
each paw one or two stalks of millet, as many under
their arms, and two or three in their mouth; and thus
ludely, hop away on their hind-legs: but, if pursued,
they sling away all, except what is in their mouths,
that it may not impede their flight. They are very
nice in the choice of the millet; examine every stalk;
and if they do not like it, sling it away: so that this
delicacy does more harm to the fields than their thievery.

Fig. 13.

16. Full-bottom monkey, with a short, black, and
naked face; that and the shoulders covered with long,
coarse, flowing hairs like a full-bottomed perriwig; of
a dirty-yellowish colour, mixed with black: body, arms,
and legs, of a fine glossy blackness, covered with short
hairs: hands naked, furnished with only four fingers;
on each foot four very long slender toes: tail very long,
of a snowy whiteness, with a tuft at the end: body
and limbs slender; length above three feet. Inhabits
the forests of Sierra Leone in Guiney; where it is called
the *hey* or *king monkey*. The negroes hold the skin
in high estimation; and use it for pouches, and for coverings
to their guns.

B. Monkeys of the new world, or the continent of
America, having neither pouches in their jaws, nor
naked buttocks. Tails of many prehensile, and naked
on the under side for a certain space next their
end.

A. With prehensile tails.

17. Beelzebub, or the preacher, has black shining
eyes; short round ears; and a round beard under the
chin and throat. The hairs on the body are of a shining
black, long, yet lie so close on each other that
the animal appears quite smooth: the feet and end of
the tail are brown; the tail very long, and always
twisted at the end. Size of a fox. Inhabit the woods
of Brasil and Guiana in vast numbers, and make a most
dreadful howling. Sometimes one mounts on a higher
branch, the rest seat themselves beneath: the first
begins as if it was to baroque, and sets up so loud and
sharp a howl as may be heard a vast way, and a person
at a distance would think that a hundred joined in the
cry: after a certain space, he gives a signal with his
hand, when the whole assembly joins in chorus; but on
another signal, is silent, and the orator finishes his
address (c). Their clamour is the most disagreeable and
tremendous that can be conceived; owing to a hollow
and hard bone placed in the throat, which the English
call the *throttle-bone*. These monkeys are very fierce,
untameable, and bite dreadfully. There is a variety
of a ferruginous or reddish bay colour, which the Indians
call the *king of the monkeys*: it is large, and as
noisy as the former. The natives eat this species, as
well as several other sorts of monkeys, but are particularly
fond of this. Europeans will also eat it, especially in those
parts of America where food is scarce: when it is scalded in
order to get off the hair, it looks very white; and has a
resemblance flocking to human

nity, that of a child of two or three years old, when
crying (n). Simia.

MONKEYS.

18. The paniscus, four-fingered, or spider-monkey, Fig. 14.

has a long flat face, of a swarthy flesh-colour: the eyes
are sunk in the head; ears like the human; limbs of a
great length, and uncommonly slender: the hair is
black, long, and rough. There are only four fingers
on the hands, being quite destitute of a thumb; five
toes on the feet. The tail is long; and naked below,
near the end. The body is slender; about a foot and
a half long: the tail near two feet, and so prehensile
as to serve every purpose of a hand.—They inhabit the
neighbourhood of Carthagena, Guiana, Brasil, and
Peru; associate in vast herds; and are scarce ever seen
on the ground. Dampier describes their gambols in
a lively manner: “There was (says he) a great com-
pany dancing from tree to tree over my head, chat-
tering, and making a terrible noise and a great many
grim faces and antic gestures; some broke down dry
sticks and flung them at me, others scattered their urine
and dung about my ears: at last one bigger than the
rest came to a small limb just over my head, and leap-
ing directly at me, made me leap back; but the mon-
key caught hold of the bough with the tip of its tail,
and there continued swinging to and fro, making
mouths at me. The females with their young ones are
much troubled to leap after the males; for they have
commonly two, one she carries under her arm, the other
fits on her back, and claps its two fore-paws about her
neck: are very fullen when taken; and very hard to
be got when shot, for they will cling with their tail
or feet to a bough, as long as any life remains; when
I have shot at one, and broke a leg or arm, I have pit-
ied the poor creature to see it look and handle the
broken limb, and turn it from side to side.”—They are
the most active of monkeys, and quite eliven the fore-
sts of America. In order to pass from top to top of
lofty trees, whose branches are too distant for a leap,
they will form a chain, by hanging down, linked to
each other by their tails, and swinging in that manner
till the lowest catches hold of a bough of the next tree,
and draws up the rest; and sometimes they pass rivers
by the same expedient. They are sometimes brought
to Europe; but are very tender, and seldom live long
in our climate.

19. The faï, or weeper, with a round and flat face, Fig. 15.

of a reddish brown colour, very deformed: the hair on
the head, and upper part of the body, black, tinged
with brown; beneath and on the limbs, tinged with
red: tail black, and much longer than the head and
body: the young excessively deformed; their hair very
long, and thinly dispersed: in the British Museum are
specimens of old and young. M. de Buffon has a vari-
ety with a white throat. Inhabits Surinam and Brasil:
appear as if they were always weeping: of a mel-
ancholy disposition; but very full of imitating what
they see done. These probably are the monkeys Dam-
pian saw in the Bay of All Saints, which he says are very
ugly, and smell strongly of musk. They keep in large
com-

40 U 2

(c) A singular account, yet related by Marcgrave and several other writers. Marcgrave is a writer of the first au-
thority, and a most able naturalist, long resident in the Brasils, and speaks from his own knowledge.

(d) *Ulloa's Voy.* I. 113. *Des Marchais*, III. 311. says, they are excellent eating, and that a *jeune aux singes* will
be found as good as any other, as soon as you have conquered the aversion to the *bonilli* of their heads, which look
very like those of little children.

Simia.

Simonians.

companies; and make a great chattering, especially in stormy weather; reside much on a species of tree which bears a podded fruit, which they feed on.

b. With straight tails, not prehensile.

Fig. 16.

20. The pithecia, or fox-tailed monkey, with a swarthy face, covered with short white down: forehead and sides of the face with whitish, and pretty long hair: body with long dusky brown hairs; white or yellowish at their tips: hair on the tail very long and bushy; sometimes black, sometimes reddish: belly and lower part of the limbs a reddish white: length from nose to tail, near a foot and a half: tail longer, and like that of a fox: hands and feet black, with claws instead of nails. Inhabits Guiana.

Fig. 17.

21. The iacchus, or striated monkey, with a very round head: about the ears two very long full tufts of white hairs standing out on each side: irides reddish: face a swarthy flesh colour: ears like the human: head black: body ash-coloured, reddish, and dusky; the last forms striated bars across the body: tail full of hair, annulated with ash-colour and black: body seven inches long; tail, near eleven: hands and feet covered with short hairs: fingers like those of a squirrel: nails, or rather claws, sharp. Inhabits Brazil: feeds on vegetables; will also eat fish: makes a weak noise: very restless: often brought over to Europe.

Fig. 18.

22. The mico, or fair monkey, with a small round head: face and ears of the most lively vermilion colour: body covered with most beautiful long hairs of a bright and silvery whiteness, of matchless elegance: tail of a shining dark chestnut: head and body eight inches long; tail twelve. Inhabits the banks of the Amazons; discovered by M. de Condamine.

SIMILE, or **SIMILITUDE**, in rhetoric, a comparison of two things, which though different in other respects, yet agree in some one. The difference between a simile and comparison is said to consist in this, that the simile properly belongs to whatever we call the quality of a thing, and the comparison to the quantity. See **COMPARISON**; and **ORATORY**, n° 84. 118.

SIMILOR, a name given to an alloy of red copper and zinc, made in the best proportions, to imitate silver and gold.

SIMON (Richard), a French critic and divine, of great sense and learning, born at Dieppe in 1638. He made a vast proficiency in the Oriental tongues, for which he had always a particular turn. He was the author and editor of several works; but the most important of his publications was his *Histoire Critique du Vieux Testament*; which appeared in 1678. He died in 1612.

SIMONICAL, is applied to any person guilty of simony. See **SIMONY**.

SIMONIANIS, in church-history, a sect of ancient heretics, so called from their founder Simon Magus or the Magician. The heresies of Simon Magus were principally his pretending to be the great power of God, and thinking that the gifts of the Holy Ghost were venal, and to be purchased with money. He is said to have invented the *Æons*, which were so many persons of whom the Godhead was supposed to be compounded. His concubine Helen he called the first intelligence, and mother of all things. Sometimes he called her *Minerva*, and himself *Jupiter*. Simon Magus gained a great many profelytes, who paid himself

and his concubine divine worship. These were the Simonides, earliest heretics, and whom St John, St Peter, and St Paul, in their epistles, so often warn Christians against.

SIMONIDES, the name of several poets celebrated in antiquity; but by the Marbles it appears, that the eldest and most illustrious of them was born in the 55th Olympiad, 538 years B. C. and that he died in his 90th year; which nearly agrees with the chronology of Eusebius. He was a native of Ceos, one of the Cyclades, in the neighbourhood of Attica, and the preceptor of Pindar. Both Plato and Cicero give him the character not only of a good poet and musician, but speak of him as a person of great virtue and wisdom. Such longevity gave him an opportunity of knowing a great number of the first characters in antiquity, with whom he was in some measure connected. It appears in Fabricius, from ancient authority, that Simonides was contemporary and in friendship with Pittacus of Mitylene, Hipparchus tyrant of Athens, Paulanias king of Sparta, Hiero tyrant of Syracuse, with Themistocles, and with Alcibiades king of Thebaly. He is mentioned by Herodotus; and Xenophon, in his Dialogue upon Tyranny, makes him one of the interlocutors with Hiero king of Syracuse. Cicero alleges, what has often been quoted in proof of the modesty and wisdom of Simonides, that when Hiero asked him for a definition of God, the poet required a whole day to meditate on so important a question; at the end of which, upon the prince putting the same question to him a second time, he asked two days respite; and in this manner always doubled the delay each time he was required to answer it; till at length, to avoid offending his patron by more disappointments, he frankly confessed that he found the question so difficult, that the more he meditated upon it, the less was his hope of being able to solve it.

In his old age, perhaps from seeing the respect which money procured to such as had lost the charms of youth and the power of attaching mankind by other means, he became somewhat mercenary and avaricious. He was frequently employed by the victors at the games to write panegyrics and odes in their praise, before his pupil Pindar had exercised his talents in their behalf: but Simonides would never gratify their vanity in this particular till he had first tied them down to a stipulated sum for his trouble; and upon being upbraided for his meanness, he said, that he had two coffers, in one of which he had for many years put his pecuniary rewards; the other was for honours, verbal thanks, and promises; that the first was pretty well filled, but the last remained always empty. And he made no scruple to confess, in his old age, that of all the enjoyments of life, the love of money was the only one of which time had not deprived him.

He was frequently reproached for this vice; however, he always defended himself with good-humour. Upon being asked by Hiero's queen, Whether it was most desirable to be learned or rich? he answered, that it was far better to be rich; for the learned were always dependent on the rich, and waiting at their doors; whereas he never saw rich men at the doors of the learned. When he was accused of being so fond as to sell part of the provisions with which his table was furnished by Hiero, he said he had done it in order "to display to the world the magnificence of that prince

Simonides,
Simony.

prince and his own frugality." To others he said, that his reason for accumulating wealth was, that "he would rather leave money to his enemies after death, than be troublesome to his friends while living."

He obtained the prize in poetry at the public games when he was four score years of age. According to Suidas, he added four letters to the Greek alphabet; and Pliny assigns to him the eighth string of the lyre; but these claims are disputed by the learned.

Among the numerous poetical productions of which, according to Fabricius, antiquity has made him the author, are many songs of victory and triumph for athletic conquerors at the public games. He is likewise said to have gained there himself the prize in elegiac poetry when *Æschylus* was his competitor.

His poetry was so tender and plaintive, that he acquired the cognomen of *Melicertes*, "sweet as honey;" and the *tearful* eye of his muse was proverbial.

"Simonides (says an elegant modern writer*), and excellent judge of every species of literary merit), was celebrated by the ancients for the sweetness, correctness, and purity of his style, and his irresistible skill in moving the passions. Dionysius places him among those polished writers who excel in a smooth volubility, and flow on, like pteuente and perennial rivers, in a course of even and uninterrupted harmony."

It is to Dionysius that we are indebted for the preservation of the following fragment of this poet. Danaë being by her merciless father inclosed in a chest, and thrown into the sea with her child, when night comes on, and a storm arises which threatens to overturn the chest, she, weeping and embracing the young Perseus, cries out:

Sweet child! what anguish does thy mother know,
Ere cruel grief has taught thy tears to flow!
Amidst the roaring wind's tremendous sound,
Which threats destruction as it howls around;
In balmy sleep thou liest, as at the breast,
Without one bitter thought to break thy rest.—
The glimmering moon in pity hides her light,
And shinks with horror at the ghastly sight.
Didst thou but know, sweet innocent! our woes,
Not oplate's pow'r thy eye-lids now could close.
Sleep on, sweet babe! ye waves in silence roar;
And hush, O hush to rest my tortur'd soul!

There is a second great poet of the name of Simonides recorded on the Marbles, supposed to have been his grandson, and who gained, in 478 B. C. the prize in the games at Athens.

SIMONY, is the corrupt presentation of any one to an ecclesiastical benefice for money, gift, or reward. It is so called from the resemblance it is said to bear to the sin of Simon Magus, though the purchasing of holy orders seems to approach nearer to his offence. It was by the canon law a very grievous crime: and is so much the more odious, because, as Sir Edward Coke observes, it is ever accompanied with perjury; for the pretence is sworn to have committed no simony. However, it was not an offence punishable in a criminal way at the common law; it being thought sufficient to leave the clerk to ecclesiastical censures. But as these did not affect the simoniacal patron, nor were efficacious enough to repel the notorious practice of the thing, divers acts of parliament have been made to restrain it by means of civil forfeitures; which the modern prevailing usage, with regard to spiritual pre-

ferments, calls aloud to be put in execution. The statute 31 Eliz. c. 6. enacts, that if any patron, for money or any other corrupt consideration or promise, directly or indirectly given, shall present, admit, institute, induct, install, or collate any person to an ecclesiastical benefice or dignity, both the giver and taker shall forfeit two years value of the benefice or dignity; one moiety to the king, and the other to any one who will sue for the same. If persons also corruptly resign or exchange their benefices, both the giver and taker shall in like manner forfeit double the value of the money or other corrupt consideration. And persons who shall corruptly ordain or license any minister, or procure him to be ordained or licensed, (which is the true idea of simony), shall incur a like forfeiture of forty pounds; and the minister himself of ten pounds, besides an incapacity to hold any ecclesiastical preferment for seven years afterwards. Corrupt elections and resignations in colleges, hospitals, and other eleemosynary corporations, are also punished, by the same statute, with forfeiture of the double value, vacating the place or office, and a devolution of the right of election, for that turn, to the crown.

SIMPLE, something not mixed or compounded; in which sense it stands opposed to *compound*.

SIMPLE, in the materia medica, a general name for all herbs or plants, as having each its particular virtue, whereby it becomes a simple remedy.

SIMPLICITY IN WRITING. If we examine the writers whose compositions have stood the test of ages, and obtained that highest honour, "the concurrent approbation of distant times and nations," we shall find that the character of simplicity is the unvarying circumstance which alone hath been able to gain this universal homage from mankind. Among the Greeks, whose writers in general are of the simple kind, the divinest poet, the most commanding orator, the finest historian, and deepest philosopher, are, above the rest, conspicuously eminent in this great quality. The Roman writers rise towards perfection according to that measure of simplicity which they mingle in their works: indeed, they are all inferior to the Greek models. But who will deny that Lucretius, Horace, Virgil, Livy, Terence, Tully, are at once the simplest and best of Roman writers? unless we add the noble annalist who appeared in after-times; who, notwithstanding the political turn of his genius, which sometimes interferes, is admirable in this great quality, and by it far superior to his contemporaries. It is this one circumstance that hath raised the venerable Dante, the father of modern poetry, above the succeeding poets of his country, who could never long maintain the local and temporary honours bestowed upon them; but have fallen under that just neglect which time will ever decree to those who desert a just simplicity for the florid colourings of style, contrasted phrases, affected conceits, the mere trappings of composition and Gothic minutie. It is this hath given to Boileau the most lasting wreath in France, and to Shakespeare and Milton in England; especially to the last, whose writings are more unmix'd in this respect, and who had formed himself entirely in the simple model of the best Greek writers and of the sacred Scriptures. As it appears from these instances, that simplicity is the only universal characteristic of just writing, so the superior

Simple,
Simplicity.

Simplicity.
|
Simpson.

eminence of the sacred Scriptures in this prime quality hath been generally acknowledged. One of the greatest critics in antiquity, himself conspicuous in the sublime and simple manner, hath borne this testimony to the writings of Moses and St Paul; and by parity of reason we must conclude, that had he been conversant with the other sacred writers, his taste and candour would have allowed them the same encomium.

It hath been often observed, even by writers of no mean rank, that the "Scriptures suffer in their credit by the disadvantage of a literal version, while other ancient writings enjoy the advantage of a free and embellished translation." But in reality those gentlemen's concern is ill-placed and groundless: for the truth is, "that most other writings are impaired by a literal translation; whereas giving only a due regard to the idiom of different languages, the sacred writings, when literally translated, are then in their full perfection."

Now this is an internal proof, that in all other writings there is a mixture of local, relative, exterior ornament, which is often lost in the transference from one language to another. But the internal beauties, which depend not on the particular construction of tongues, no change of tongue can destroy. Hence the Bible-composition preserves its native beauty and strength alike in every language, by the sole energy of unadorned phrase, natural images, weight of sentiment, and great simplicity.

It is in this respect like a rich vein of gold, which, under the severest trials of heat, cold, and moisture, retains its original weight and splendour, without either loss or alloy; while baser metals are corrupted by earth, air, water, fire, and assimilated to the various elements through which they pass.

This circumstance, then, may be justly regarded as sufficient to vindicate the composition of the sacred Scriptures, as it is at once their chief excellence and greatest security. It is their excellence, as it renders them intelligible and useful to all; it is their security, as it prevents their being disguised by the false and capricious ornaments of vain or weak translators. We may safely appeal to experience and fact for the confirmation of these remarks on the superior simplicity, utility, and excellence of the style of the holy Scripture. Is there any book in the world so perfectly adapted to all capacities? that contains such sublime and exalted precepts, conveyed in such an artless and intelligible strain, that can be read with such pleasure and advantage by the lettered sage and the unlettered peasant?

SIMPLOCE. See ORATORY, n° 72.

SIMPSON (Thomas), professor of mathematics at the royal academy at Woolwich, fellow of the Royal Society, and member of the Royal Academy at Stockholm, was born at Market Bosworth in Leicestershire in 1710. His father, a stuff-weaver, taught him only to read English, and brought him up to his own business; but meeting with a scientific pedlar, who likewise practised fortune-telling, young Simpson by his assistance and advice, left off weaving, and professed astrology. As he improved in knowledge, however, he grew disgusted with his pretended art; and renouncing it, was driven to such difficulties for the subsistence of his family, that he came up to London, where he worked as a weaver, and taught mathematics at his

spare hours. As his scholars increased, his abilities became better known, and he published his Treatise on Fluxions by subscription in 1737; in 1740, he published his Treatise on the Nature and Laws of Chance; and Essays in speculative and mixed Mathematics. After these appeared his Doctrine of Annuities and Reversions; Mathematical Dissertations; Treatise on Algebra; Elements of Geometry; Trigonometry, plane and spherical; Select Exercises; and his Doctrine and Application of Fluxions; which he professes to be rather a new work, than a second edition of his former publication on fluxions. In 1743, he obtained the mathematical professorship at Woolwich academy; and soon after was chosen a member of the Royal Society, when the president and council, in consideration of his moderate circumstances, were pleased to excuse his admission-fees, and his giving bonds for the settled future payments. At the academy, he exerted all his abilities in instructing the pupils who were the immediate objects of his duty, as well as others whom the superior officers of the ordnance permitted to be boarded and lodged in his house. In his manner of teaching, he had a peculiar and happy address, a certain dignity and perspicuity, tempered with such a degree of mildness, as engaged the attention, esteem, and friendship, of his scholars. He therefore acquired great applause from his superiors in the discharge of his duty. His application and close confinement, however, injured his health. Exercise and a proper regimen were prescribed to him, but to little purpose; for his spirits sunk gradually, till he became incapable of performing his duty, or even of reading the letters of his friends. At length his physicians advised his native air for his recovery, and he set out in February 1761; but was so fatigued by his journey, that, upon his arrival at Bosworth, he betook himself to his chamber, and grew continually worse till the day of his death, which happened on the 14th of May, in the 51st year of his age.

SIN, a breach or transgression of some divine law or command.

SINAPI, MUSTARD; a genus of the filiquosa order, belonging to the tetradynamia class of plants. The principal species are, 1. The alba, or white mustard, which is generally cultivated as a salad-herb for winter and spring use. This rises with a branched hairy stalk two feet high; the leaves are deeply jagged on their edges and rough. The flowers are disposed in loose spikes at the end of the branches, standing upon horizontal footstalks; they have four yellow petals in form of a cross, which are succeeded by hairy pods that end with long, compressed oblique beaks; the pods generally contain four white seeds.

2. The nigra, or common mustard, which is frequently found growing naturally in many parts of Britain, but is also cultivated in fields for the seed, of which the sauce called *mustard* is made. This rises with a branching stalk four or five feet high; the lower leaves are large, rough, and very like those of turnep; the upper leaves are smaller and less jagged. The flowers are small, yellow, and grow in spiked clusters at the end of the branches; they have four petals placed in form of a cross, and are succeeded by smooth four-cornered pods.

3. The arvensis, grows naturally on arable land in many

Simpson
|
Sinapi.

SINGIN
Singing.

many parts of England. The feed of this is commonly fold under the title of *Durham mustard-feed*; of this there are two varieties, if not distinct species; one with cut, the other has entire leaves. The stalks rise two feet high; the leaves are rough, and in one they are jagged like turnep-leaves; the other are long and entire. The flowers are yellow; the pods are turgid, angular, and have long beaks.

Mustard, by its acrimony and pungency, stimulates the solids, and attenuates viscid juices; and hence stands deservedly recommended for exciting appetite, assisting digestion, promoting the fluid secretions, and for the other purposes of the acrid plants called *antiscorbutic*. It imparts its taste and smell in perfection to aqueous liquors, whilst spirit of wine extracts very little of either: the whole of the pungency arises with water in distillation. By expression it yields a considerable quantity of a soft inipid oil, perfectly void of acrimony: the cake left after the expression is more pungent than the mustard was at first.—By distillation with a violent fire, mustard yields a volatile alkali, empyreumatic oil, and a small quantity of phosphorus.

SINAPISM, in pharmacy, an external medicine, in form of a cataplasm, composed chiefly of mustard-feed pulverized and mixed with the pulp of figs, or with briony, garlic, onion, or the like.

SINCERITY, honesty of intention, freedom from hypocrisy. See *MORAL Philosophy*, n° 157.

SINCIPIUT, in anatomy, the fore-part of the head, reaching from the forehead to the coronal future.

SINE, or *right SINE of an Arch*, in trigonometry, is a right line drawn from one end of that arch, perpendicular to the radius drawn to the other end of the arch; being always equal to half the chord of twice the arch. See *TRIGONOMETRY*, and *GEOMETRY*.

SINECURES, ecclesiastical benefices without cure of souls.

SINEW, denotes properly what we call a *nerve*, tho' in common speech it is rather used for a *tendon*.

SINGING, the action of making divers inflexions of the voice, agreeable to the ear, and correspondent to the notes of a song, or piece of melody. See *MUSICOLOGY*.

The first thing to be done in learning to sing, is to raise a scale of notes by tones and semi-tones to an octave, and descend by the same notes; and then to rise and fall by greater intervals, as a third, fourth, fifth, &c. and to do all this by notes of different pitch. Then these notes are represented by lines and spaces, to which the syllables *fa, sol, la, mi*, are applied, and the pupil taught to name each line and space thereby; whence this practice is called *sol-fa-ing*, the nature, reason, effects, &c. whereof, see under the article *SOLF-FAING*.

SINGING of Birds. It is worthy of observation, that the female of no species of birds ever sings: with birds, it is the reverse of what occurs in human kind. Among the feathered tribe, all the cares of life fall to the lot of the tender sex; theirs is the fatigue of incubation; and the principal share in nursing the helpless brood: to alleviate these fatigues, and to support her under them, nature hath given to the male the song, with all the little blandishments and soothing arts;

these he fondly exerts (even after courtship) on some spray contiguous to the nest, during the time his mate is performing her parental duties. But that he should be silent is also another wise provision of nature, for her song would discover her nest; as would a gaudiness of plumage, which, for the same reason, seems to have been denied her.

On the song of birds several curious experiments and observations have been made by the Hon. Daines Barrington. See *Philosophical Transactions*, vol. lxiij.

SINGULAR NUMBER, in grammar, that number of nouns and verbs which stands opposed to plural; and is used when we only speak of a single, or one person or thing. See *GRAMMAR*.

The Latins, French, English, &c. have no numbers but the singular and plural; but the Greeks and Hebrews have likewise a dual number, peculiar to two persons.

SINISTER, something on or towards the left hand. Hence some derive the word *sinister*, à *sinendo*; because the gods, by such auguries, permit us to proceed in our designs.

SINISTER, is ordinarily used among us for unlucky; though, in the sacred rites of divination, the Romans used it in an opposite sense. Thus *avis sinistra*, or a bird on the left hand, was esteemed a happy omen: whence, in the law of the 12 tables, *Ave sinistra populi magister esto*.

SINISTER, in heraldry. The sinister side of an escutcheon is the left-hand side; the sinister chief, the left angle of the chief; the sinister base, the left-hand part of the base.

SINISTER Aspect, among astrologers, is an appearance of two planets happening according to the succession of the signs; as Saturn in Aries, and Mars in the same degree of gemini.

SINISTRI, a sect of ancient heretics, thus called because they held the left hand in abhorrence, and made it a point of religion not to receive any thing therewith.

SINKING FUND, a provision made by parliament, consisting of the surplusage of other funds, intended to be appropriated to the payment of the national debt; on the credit of which very large sums have been borrowed for public uses. See *NATIONAL Debt*, and *REVENUE*.

SINOPICA TERRA, in natural history, the name of a red earth of the ochre kind, called also *rubrica sinopica*, and by some authors *sinopis*. It is a very close, compact, and weighty earth, of a fine glowing purple colour. It is of a pure texture, but not very hard, and of an even but dusty surface. It adheres firmly to the tongue, is perfectly fine and smooth to the touch, does not crumble easily between the fingers, and stains the hands. It melts very slowly in the mouth, is perfectly pure and fine, of an austere astringent taste, and ferments violently with aqua-fortis. It was dug in Cappadocia, and carried for sale to a city in the neighbourhood called *Sinope*, whence it had its name. It is now found in plenty in the New Jerseys in America, and is called by the people there *blood-stone*. Its fine texture and body, with its high florid colour, must make it very valuable to painters; and its astringency promises it to be a powerful medicine.

SINOPE, in heraldry, denotes vert, or green colour.

Singular
Sinople.

Sinvolity. *Sirens.* *Siren.* *Sifon.* *Sifon.*
 lour in armories.—Sinople is used to signify love, youth, beauty, rejoicing, and liberty; whence it is that letters of grace, ambition, legitimation, &c. are always used to be sealed with green wax.

SINUOSITY, a series of bends and turns in arches, or other irregular figures, sometimes jetting out, and sometimes falling in.

SINUS, in anatomy, denotes a cavity in certain bones and other parts, the entrance whereof is very narrow, and the bottom wider and more spacious.

SINUS, in surgery, a little cavity or sacculus, frequently formed by a wound or ulcer, wherein pus is collected.

SIPHON, in hydrostatics. See HYDROSTATICS, n° 20.

SIR, the title of a knight or baronet, which, for distinction's sake, as it is now given indiscriminately to all men, is always prefixed to the knight's Christian name, either in speaking or writing to them.

SIRE, a title of honour in France, now given to the king only as a mark of sovereignty.

SIRENS, in fabulous history, certain celebrated songstresses who were ranked among the demi-gods of antiquity.

Hyginus places their birth among the consequences of the rape of Proserpine. Others make them daughters of the river Achelous and one of the muses. *Ovid Met.* lib. v.

The number of the Sirens was three; and their names were *Parthenope*, *Lygea*, and *Leucosia*. Some make them half women and half fish; others, half women and half birds. There are antique representations of them still subsisting under both these forms.

Pausanias tells us, that the Sirens, by the persuasion of Juno, challenged the Muses to a trial of skill in singing; and these having vanquished them, plucked the golden feathers from the wings of the Sirens, and formed them into crowns, with which they adorned their own heads.

The Argonauts are said to have been diverted from the enchantment of their songs by the superior strains of Orpheus: Ulysses, however, had great difficulty in securing himself from seduction. (See *Odyf.* lib. xii.)

Pope, in his notes to the twelfth book of the *Odyssey*, observes, the critics have greatly laboured to explain what was the foundation of this fiction of Sirens. We are told by some, that the Sirens were queens of certain small islands named *Sirensuse*, that lie near Caprea in Italy, and chiefly inhabited the promontory of Minerva, upon the top of which that goddess had a temple, as some affirm, built by Ulysses. Here there was a renowned academy, in the reign of the Sirens, famous for eloquence and the liberal sciences, which gave occasion to the invention of this fable of the sweetness of the voice, and attracting songs of the Sirens. But why then are they fabled to be destroyers, and painted in such dreadful colours? We are told, that at last the students abused their knowledge, to the colouring of wrong, the corruption of manners, and the subversion of government: that is, in the language of poetry, they were feigned to be transformed into monsters, and with their music to have enticed passengers to their ruin, who there consumed their patrimonies, and poisoned their virtues with riot

and effeminacy. The place is now called *Maffa*. Some writers tell us of a certain bay, contracted within winding freights and broken cliffs, which, by the singing of the winds and beating of the waters, returns a delightful harmony, that allures the passenger to approach, who is immediately thrown against the rocks, and swallowed up by the violent eddies. Thus Horace, moralising, calls *idleness* a Siren,

—*Vitanda est improba Siren*
Deledia

But the fable may be applied to all pleasures in general, which, if too eagerly pursued, betray the incautious into ruin; while wise men, like Ulysses, making use of their reason, stop their ears against their insinuations.

All ancient authors agree in telling us, that Sirens inhabited the coast of Sicily. The name, according to Bochart, who derives it from the Phœnician language, implies a songstress. Hence it is probable, says Mr Burney, that in ancient times there may have been excellent singers, but of corrupt morals, on the coast of Sicily, who, by seducing voyagers, gave rise to this fable. And if this conjecture be well founded, he observes, the Muses are not the only pagan divinities who preserved their influence over mankind in modern times; for every age has its Sirens, and every Siren her votaries; when beauty and talents, both powerful in themselves, are united, they become still more attractive.

SIREN in zoology, a genus belonging to the order of amphibia nantes. The body is naked, and furnished with two unguiculated feet and a tail. It has a great resemblance to a lizard, only it is larger. It is found in marshy grounds in Carolina.

SIRIUS, in astronomy, a bright star in the constellation Canis. See ASTRONOMY, n° 206.

SIRLET (Flavius), an eminent Roman engraver on precious stones: his Laocœn, and representations in miniature of antique statues at Rome, are almost invaluable, and very scarce. He died in 1737.

SIRMOND (James), a famous Jesuit, and one of the most learned men France has produced, was born at Riom in 1559. He became well skilled in ecclesiastical antiquities; and acquired great reputation throughout all Europe by his profound erudition and his works. He was invited to Rome in 1590 by father Acquaviva, to whom he was secretary for above 16 years. The cardinals Baronius, d'Ossat, and Barberino, had a particular esteem for him; and he was of some service to the former in assisting him in composing his *Annals*. In 1608 he returned to Paris; and from that time scarcely ever let a year pass without publishing some of his works. He at length became confessor to Lewis XIII. and for a long time enjoyed that place. He died at Paris in 1651. He published a great number of books; the principal of which are, *Excellent Notes on the Councils of France*, the *Capitularies of Charles the Bald*, and the *Theodosian Code*; good editions of the *Works of Theodoret* and *Hincmar of Rheims*; and many *Opuscula on different Subjects*, printed at Paris in 1696, in five vols folio.

SISON, BASTARD PARSLEY, a genus of the dymnia order, belonging to the pentandria class of plants. There are six species, the most remarkable of

Sistrum of which is the amomum, or common bastard-parley. This is a biennial plant about three feet high, growing wild in many places of Britain. Its seeds are small, striated, of an oval figure and brown colour. Their taste is warm and aromatic. Their whole flavour is extracted by spirit of wine, which elevates very little of it in distillation; and hence the spirituous extract has the flavour in great perfection, while the watery extract has very little. A tincture drawn with pure spirit is of a green colour. The seeds have been esteemed aperient, diuretic, and carminative; but are little regarded in the present practice.

SISTRUM, or **CISTRUM**, a kind of ancient musical instrument, used by the priests of Isis and Osiris. It is described by Spon as of an oval form, in manner of a racket, with three sticks traversing it breadthwise; which playing freely by the agitation of the whole instrument, yielded a kind of sound which to them seemed melodious. Mr Malcolm found the sistrum to be no better than a kind of rattle. Oisilius observes, that the sistrum is found represented on several medals and on talismans.

SISYMBRIUM, **WATER-CRESS**; a genus of the *Silicula* order, belonging to the *tetradynamia* class of plants. There are 25 species; the most remarkable is the *nasturtium*, or common water-cress. This grows naturally in rivulets and clear flowing waters in this country. The leaves are a strong antiscorbutic, and the expressed juice contains all their virtues. It is an ingredient in the *fuccicorbutici* of the shops, and may be taken in the dose of one or two ounces.

SISYPHUS, in fabulous history, one of the descendants of Eolus, married Merope, one of the *Pleiades*, who bore him *Glaucus*. He resided at *Epyra* in *Peloponnesus*, and was a very crafty man. Others say, that he was a Trojan secretary, who was punished for discovering secrets of state; and others again, that he was a notorious robber, killed by *Theseus*. However, all the poets agree that he was punished in *Tartarus* for his crimes, by rolling a great stone to the top of an hill, which constantly recoiled, and, rolling down incessantly, renewed his labour.

SITE, denotes the situation of an house, &c. and sometimes the ground-plot or spot of earth it stands on.

SITTA, in ornithology, a genus belonging to the order of *picæ*. The bill is subulated, cylindrical, straight, and entire; the superior mandible being longer than the inferior, and compressed at the point. The tongue is lacerated, and the nostrils covered with hairs. There are three species, distinguished by their colour. The *Europæa*, or nut-hatch, is in length near five inches three-quarters, breadth nine inches; the bill is strong and straight, about three quarters of an inch long; the upper mandible black, the lower white: the irides are hazel; the crown of the head, back, and coverts of the wings, of a fine bluish grey: a black streak passes over the eye from the mouth: the cheeks and chin are white; the breast and belly of a dull orange-colour; the quill-feathers dusky; the wings underneath are marked with two spots, one white at the root of the exterior quill, the other black at the joint of the bastard-wing: the tail consists of twelve feathers; the two middle are grey, the two exterior feathers tipped with grey; then

Vol. X.

succeeds a transverse white spot; beneath that the rest is black: the legs are of a pale yellow; the back-toe very strong, and the claws large.

The bird runs up and down the bodies of trees, like the woodpecker tribe; and feeds not only on insects, but nuts, of which it lays up a considerable provision in the hollows of trees: it is a pretty light, says Mr Willoughby, to see her fetch a nut out of her hoard, place it fast in a chink, and then, standing above it with its head downwards, striking it with all its force, break the shell, and catch up the kernel. It breeds in the hollows of trees; if the entrance to its nest be too large, it stops up part of it with clay, leaving only room enough for admission: in autumn it begins to make a chattering noise, being silent for the greatest part of the year. Dr Plott tells us, that this bird, by putting its bill into a crack in the bough of a tree, can make such a violent sound as if it was rending asunder, so that the noise may be heard at least twelve score yards.

SIUM, **KEX**; a genus of the *digynia* order, belonging to the *pentadria* class of plants. There are eight species; the most remarkable is the *latifolium*, or great water-parley, which grows spontaneously in many places both of England and Scotland on the sides of lakes, ponds, and rivulets. The stalk is erect and furrowed, a yard high or more. The leaves are pinnated with three or four pair of large-elliptic pinnæ, with an odd one at the end, all serrated on the edges. The stalk and branches are terminated with erect umbels, which is the chief characteristic of the species. Cattle are said to have run mad by feeding upon this plant.

SIXTH, in music, one of the simple original concord or harmonic intervals. See **INTERVAL**.

SIXTUS V. (pope), the most extraordinary man of his time. His father, a poor vine-dresser, unable to maintain him, put him out to a farmer, who made him keep his sheep, and afterwards his hogs. His real name is not known, but in this station he called himself *Felix*; and, from his earliest youth, he seems to have had an unaccountable prepossession or impulse of his future greatness. By degrees he rose to be inquisitor at Venice; but quarrelling with the senate, he was obliged to quit the territories of the republic. Being rallied upon his precipitate retreat, he replied, that having made a vow to be pope at Rome, he did not think it right to stay to be hanged at Venice. By his intrigues and address he obtained a cardinal's hat from pope Pius V. By an affectation of great humility, and the appearance of being loaded with bodily infirmities, he so far deceived the conclave, after the death of pope Gregory XIII. that, being divided into factions, in order to put an end to the hopes and cabals of each, they elected him pope, imagining that he would not live long, and in the mean time that the factions would be weakened, and render the choice of a successor less difficult. Sixtus was no sooner elected, than he threw away his crutch, and with it all his assumed debility, to the great astonishment of the whole conclave. Nor was the change in his manners remarkable than in his person. Instead of his former humility and complaisance, he treated every one with reserve and haughtiness; those particularly who had been most instrumental in his exaltation.

Sixtus,
||
Size.

tation. The lenity of his predecessor Gregory's government had introduced a licentiousness among all ranks of people : but the reformation of abuses both in church and state was the first and principal care of Sixtus; and this he signified very early. It had been customary with many preceding popes to order the prison-doors to be set open on the day of their coronation; and in expectation of this act of grace, many of the banditti and other delinquents were wont to surrender themselves on the election of a new pope. Sixtus, on the contrary, ordered that four of the most notorious offenders should be publicly executed at the very time of his coronation; two by the axe, and two by the halter: and, in conformity to the resolution he had taken he put an early stop to the profligacy of the people, he conducted himself with an unexampled severity in the punishment of offenders, without the least respect to persons; of which many instances are recorded. He particularly directed the legates and governors of the ecclesiastical state to be expeditious in their criminal processes; declaring, he had rather have the gibbets and gallies full than the prisons; and had in view the shortening law-proceedings in general. At his accession to the papacy, he found the apostolic chamber not only exhausted, but in debt; he left it clear, and enriched with five millions of gold. To him the city of Rome was obliged for several of its greatest embellishments, particularly the Vatican library; and to him its citizens were indebted for the introduction of trade into the ecclesiastical state. This great man, who was also a patron of learning and of men of genius, died, not without the suspicion of having been poisoned by the Spaniards, in 1590; having enjoyed the papacy little more than five years. A Latin version of the Bible, compiled by his order, appeared in the same year, in three vols folio; but so many faults were discovered in it, that it was suppressed by his successor Gregory XIV. Clement VIII. who succeeded Gregory caused a new edition to be printed, in which the errors of the first are corrected; and this is very scarce.

SIYA-GHUSH, the caracal of Buffon, an animal of the cat kind. It has a lengthened face, and small head; very long slender black ears, terminated with a long tuft of black hairs; inside and bottom of the ears white; nose white; eyes small: the upper part of the body is of a very pale reddish brown, the tail rather darker; belly and breast whitish; limbs strong, and pretty long: tail about half the length of the body. They inhabit Persia, India, and Barbary; where they are often brought up tame, and used in the chase of lesser quadrupeds, and of the larger sort of birds, such as cranes, peacocks, &c. which they surprisewith great address: when they seize their prey, they hold it fast with their mouth, and lie for a time motionless on it. They are said to attend the lion, and to feed on the remains of the prey that animal leaves. They are very fierce when provoked: Dr Charleton says, he saw one fall on a hound, which it killed; and tore to pieces in a moment, notwithstanding the dog defended itself to the utmost. The Arabian writers call it *Anakel Ard*: they say that it hunts like the panther; jumps up at cranes as they fly; and covers its steps when hunting.

SIZE, the name of an instrument used for finding the bigness of fine round pearls. It consists of thin

pieces or leaves, about two inches long, and half an inch broad, fastened together at one end by a rivet. In each of these are round holes drilled of different diameters. Those in the first leaf serve for measuring pearls from half a grain to seven grains; those of the second, for pearls from eight grains or two carats to five carats, &c.; and those of the third, for pearls from six carats and a half to eight carats and a half.

SIZE, is also a sort of paint, varnish, or glue used by painters, &c.

The shreds and parings of leather, parchment, or vellum, being boiled in water and strained, make size. This substance is much used in many trades.—The manner of using size is to melt some of it over a gentle fire; and scraping as much whiting into it as may only colour it, let them be well incorporated together; after which you may whiten frames, &c. with it. After it dries, melt the size again, and put more whiting, and whiten the frames, &c. seven or eight times, letting it dry between each time: but before it is quite dry, between each washing with size, you must smoothe and wet it over with a clean brush-pencil in fair water.

To make gold-size. Take gum animi and asphaltum, of each one ounce; minium, litharge of gold, and amber, of each half an ounce: reduce all into a very fine powder, and add to them four ounces of linseed-oil, and eight ounces of drying oil: digest them over a gentle fire that does not flame, so that the mixture may only simmer, but not boil; for fear it should run over and set the house on fire, keep it constantly stirring with a stick till all the ingredients are dissolved and incorporated, and do not leave off stirring till it becomes thick and ropy; and being boiled long enough, let it stand till it is almost cold, and then strain it through a coarse linen cloth, and keep it for use.—To prepare it for working, put what quantity you please in a horse-muscle shell, adding as much oil of turpentine as will dissolve it; and making it as thin as the bottom of your feed-lac varnish, hold it over a candle, and then strain it through a linen-rag into another shell; add to these as much vermilion as will make it of a darkish red: if it is too thick for drawing, you may thin it with some oil of turpentine. The chief use of this size is for laying on of metals.

The best gold-size for burnishing is made as follows. Take fine bole, what quantity you please; grind it finely on a marble, then scrape into it a little beef-suet; grind all well together; after which mix in a small proportion of parchment-size with a double proportion of water, and it is done.

To make silver-size. Take tobacco-pipe clay in fine powder, into which scrape some black-lead, and a little Genoa soap, and grind them all together with parchment-size as already directed.

SKELETON, in anatomy, the dried bones of any animal joined together by wires, or by the natural ligaments dried, in such a manner as to show their position when the creature was alive.

SKIE, one of the greatest of the Western Islands of Scotland, so called from *Skianach*, which in the Erse dialect signifies winged, because the two promontories of Valeracels and Trotternels, by which it is bounded on the north-west and north-east, are supposed to resemble wings. The island lies between the shire of Ross and the

Size
||
Skie.

the western part of Lewis, extending 40 miles in length from north to south; in some places 20, and in others 30, in breadth; the circumference of the whole amounting to about 100. The island of Skie is divided between two proprietors: the southern part belongs to the laird of Macleod, said to be lineally descended from Leod son to the black prince of Man: the northern district, or barony of Trotterness, is the property of Sir James Macdonald, whose ancestor was Donald, king or lord of the isles, and chief of the numerous clan of Macdonalds, who are counted the most warlike of all the Highlanders. Skie is part of the shire of Inverness, and formerly belonged to the diocese of the isles: on the south, it is parted from the main land by a channel three leagues in breadth; though, at the ferry of Glenelly, it is so narrow that a man may be heard calling for the boat, from one side to the other. Skie is well provided with variety of excellent bays and harbours.

The face of the country is roughened with mountains, some of which are so high as to be covered with snow on the top at Midsummer; in general, their sides are clothed with heath and grass, which afford good pasture for sheep and black cattle. Between the mountains there are some fertile valleys, and the greater part of the land towards the sea-coast is plain and arable. The island is well watered with a great number of rivers, above 30 of which afford salmon; and some of them produce black muscles in which pearls are bred, particularly the rivers Kilmartin and Ord: Martin was assured by the proprietor of the former, that a pearl hath been found in it valued at 20*l*. Sterling. Here is also a considerable number of freshwater lakes well stored with trout and eels. The largest of these lakes takes its denomination from St Columba, to whom is dedicated a chapel that stands upon a small isle in the middle of the lake. Skie likewise affords several cataracls, that roar down the rocks with great impetuosity. That the island has been formerly covered with woods, appears from the large trunks of fir and other trees daily dug out of the bogs and peat-marshes in every part of this country.

The air is cold and moist; the climate rainy, but not unwholesome. The soil is generally black, though it likewise affords clay of different colours; such as white, red, and blue, and in some places fuller's earth. The island produces barley, oats, rye, pease, and plenty of grass for pasture, together with pot-herbs and roots for the kitchen: in the article of fruit it is very defective; tho' there are some in the orchards belonging to the proprietors.

The minerals found here are lead and iron ore, which, however, have never been wrought to any advantage. Near the village Sartle, the natives find black and white marcasites, and variegated pebbles. The apple-green, in the neighbourhood of Loch-fallart, produces beautiful agates of different sizes and colours: stones of a purple hue are, after great rains, found in the rivulets: crystal, of different colours and forms, abounds in several parts of the island, as well as black and white marble, free-stone, limestone, and talc: small red and white coral is found on the southern and western coasts in great abundance. The fuel consists chiefly of peat and turf, which are impregnated with iron ore and salt-petre; and coal has been discovered in several districts.

The animals are horses, hogs, sheep, goats, cows, and deer. The black cattle are here exposed to all the rigours of the severe winter, without any other provender than the tops of the heath and the alga marina; so that they appear like mere skeletons in the spring, though as the grass grows up, they soon become plump and juicy, the beef being sweet, tender, and finely interlarded. Here are land and water fowl in abundance; eagles, hawks, heathcocks, growle, ptarmigan, pigeons, plover, wild geese, &c. The amphibious animals are seals and otters. Among the reptiles they reckon vipers, asps, weasels, frogs, toads, and three different kinds of serpents; the first spotted black and white, and very poisonous; the second, yellow with brown spots; and the third of a brown colour, the smallest and least poisonous.

All the coast of Skie swarms with fish, cod, ling, mackarel, whiting, haddock, thornback, turbot, and herrings, which they preserve without salt, by gutting and hanging them to dry in the smoke. In the bays and anchoring places, the natives find shell-fish of all kinds. The kyle of Scalpa teems with oysters, in such a manner that, after some spring-tides, 20 horse-loads of them are left upon the sands. Near the village of Bernstall, the beach yields muscles sufficient to maintain 60 persons *per* day; this providential supply helps to support many poor families in times of scarcity.

The people are strong, robust, healthy, and prolific. They generally profess the Protestant religion; are honest, brave, innocent, and hospitable. They speak the language, wear the habit, and observe the customs that are common to all the Hebrides. The meconium in new-born infants is purged away with fresh butters: the children are bathed every morning and evening in water, and grow up so strong, that a child of 10 months is able to walk alone: they never wear shoes or stockings before the age of eight or ten, and night-caps are hardly known: they keep their feet always wet; they lie on beds of straw or heath, which last is an excellent restorative: they are quick of apprehension, ingenious, and very much addicted to music and poetry. They eat heartily of fish; but seldom regale themselves with flesh-meat: their ordinary food consists of butter, cheese, milk, potatoes, colewort, brochan, and a dish called *oon*, which indeed is no other than the froth of boiled milk or whey raised with a stick like that used in making chocolate.

There are two fairs held annually at Portry, on the east side of Skie; the first on the middle of June, the other about the beginning of September. The commodities here sold, are horses, cows, sheep, goats, hides, butter, cheese, fish, and wool. The cattle sold in these fairs swim over to the main land through a mile or half a mile of sea. Many thousands of these beasts are driven up yearly to England, where they are fatted for the market, and counted delicious eating.

In Skie appear many ruins of Danish forts, watch-towers, beacons, temples, and sepulchral monuments. All the forts are known by the term *Dun*; such as Dun-Skudborg, Dun-Derig, Dun-Skerinefs, Dun-David, &c.

SKIFF, the least of two ship-boats, serving chiefly to go ashore in when the ship is in the harbour.

Skin
||
Slate.

SKIN, in anatomy, the general covering of the body of any animal. See ANATOMY, n° 73, 75, &c.

SKIN, in commerce, is particularly used for the membrane stripped off the animal to be prepared by the tanner, skinner, parchment-maker, &c. and converted into leather, &c. See TANNING.

SKINNER (Stephen), an English antiquarian, born in 1622. He travelled, and studied in several foreign universities during the civil wars; and in 1654, returned and settled at Lincoln, where he practised physic with success until the year 1667, when he died of a malignant fever. His works were collected in folio, in 1671, by Mr Henshaw, under the title of *Etymologicæ Linguae Anglicanae*, &c.

SKIRMISH, in war, a disorderly kind of combat or encounter, in preference of two armies, between small parties, who advance from the body for that purpose, and introduce to a general and regular fight.

SKULL, in anatomy, the bony case in which the brain is inclosed. See ANATOMY, n° 10, &c.

SKY-ISLAND. See SKIE.

SKY, the blue expanse of air or atmosphere. For the reason of its blue colour and concave figure, see ORBIS, N° 137, and p. 5567, col. 1.

SLAB, an outside fappy plank or board sawed off from the sides of a timber-tree. The word is also used for a flat piece of marble.

SLATE, (*stegania*), a stone of a compact texture, and laminated structure, splitting into fine plates.

Dr Hill distinguishes four species of *stegania*. 1. The whitish *steganium*, being a soft, friable, slaty stone, of a tolerably fine and close texture, considerably heavy, perfectly dull and destitute of brightness, variegated with a pale brown or brownish yellow. This species is common in many counties of England, lying near the surface of the ground. It is generally very full of perpendicular as well as horizontal cavities, many of which are filled up with a spar a little purer and more crystalline than the rest; and is commonly used for covering houses. 2. The red *steganium* is a very fine and elegant slate, of a smooth surface, firm and compact texture, considerably heavy, and of a very beautiful pale purple, glittering all over with small glossy spangles: it is composed of a multitude of very thin plates or flakes, laid closely and evenly over one another, and cohering pretty firmly: this is very common in the northern parts of England, and is much valued as a strong and beautiful covering for houses. 3. The common blue *steganium*, is very well known as a useful and valuable stone, of a fine smooth texture and glossy surface, moderately heavy, and of a pale greyish blue; composed of a multitude of even plates, laid close upon one another, and easily splitting at the commissures of them: this is also very common in the north parts of England, and is used in most places for the covering of houses. There are other species of this slate, viz. the brownish blue friable *steganium*, usually called *coal-slate*; the greyish black friable *steganium*, commonly called *sliver*; and the greyish blue sparkling *steganium*. 4. The friable, aluminous, black *steganium*, being the Irish slate of the hops: this is composed of a multitude of thin flakes, laid very evenly and regularly over one another, and splits very readily at the commissures of them. It is common in many parts of Ireland, and is found in some places in Eng-

land, always lying near the surface in very thick strata. In medicine it is used in hæmorrhages of all kinds with success, and is taken often as a good medicine in fevers.

SLAVE, a person in the absolute power of a master, either by war or conquest. See SERVANT.—Ménage and Vossius derive the word from *Sclavus*, the name of a Scythian people, whom Charlemagne condemned to perpetual imprisonment; whence the Italians made their *schlavo*, the Germans their *schlave*, the French their *esclave*, and we *slave*. The Italians and other nations used to buy these Selavi or Slavonians to make drudges of; whence the proper name of a nation, became in time the name of a state or condition.—The Romans called their slaves *servi*, from *servare*, to “keep, save;” as being such as were not killed, but saved, to yield money either by sale or by their work. Though other authors are of opinion that the Roman name *servi* might come from that of *Serbi*, as that of *slaves* from *Slavi*, a people.

We find no mention of slaves before the deluge; but immediately after, viz. in the curse of Canaan, Gen. ix. 25: whence it is easily inferred, that servitude commenced soon after that time; for in Abraham's days we find it generally established.—Some will have it to have commenced under Nimrod, because it was he who first began to make war, and of consequence to make captives; and to bring such as he took, either in his battles or irruptions, into slavery.

Among the Romans, a slave, when he was set at liberty, changed his name into a surname, and took the nomen or prænomen of his master; to which he added the cognomen he had been called by when a slave. Great part of the Roman wealth consisted in slaves: they had the power of life and death over them, which no other nation had; but this severity was afterwards moderated by the laws of the emperors. The slaves were esteemed the proper goods of their masters, and all they got belonged to them; but if the master was too cruel in his correction, he was obliged to sell his slave at a moderate price. The Romans not only approved of, but even invented new ways of making slaves; for instance, a man born free among them might sell his freedom and become a slave. There were generally three ways of obtaining slaves; either when they bought them with the booty taken from the enemy, distinct from the share reserved for the public; or of those who took them prisoners in war; or of merchants who dealt in them, and sold them at fairs.

Slavery is absolutely abolished in Britain and France, as to personal servitude. See SERVANTS.

SLAUGHTER. See MAN-SLAUGHTER, HOMICIDE, MURDER, &c.

SLEEP, that state of the body in which, though the vital functions continue, the senses are not affected by the ordinary impressions of external objects.

Under the article DREAMS, the nature of sleep has been investigated so fully, that little remains to be said in this place, besides the obviating a few objections that may be made to the account of it there given.—Sleep we have shown to arise immediately from the communication between our sentient principle and external objects being cut off, in consequence of which memory is also lost, and the person becomes insensible of existence. This state may

Slave
||
Sleep.

Sleep. may be induced either by such causes as affect the brain, the nervous system, or the blood; though it probably depends in most cases on the state of the vital fluid. The greatest difficulties that occur in giving a solution of the phenomenon of sleep is, that it may be brought on by seemingly opposite causes. Thus, though moderate fatigue will induce a propensity to sleep, the same may be brought on by eating a full meal without any fatigue at all. In like manner, though moderate fatigue will induce sleep, too great a degree of fatigue will prevent it altogether.—This, however, may easily be solved, on the principles laid down in the abovementioned article. It is there supposed that the mass of blood contains the vital principle, or what is called the *animal-spirits*, like a general reservoir, to be distributed through the whole body. Part of the blood is sent to the brain, where another collection or reservoir is made, serving in a particular manner for the purposes of reason, memory, and the rest of our mental faculties. The rest of the blood is distributed through the whole body, where some part of the vital spirit is taken up by each of the small extremities of the nerves, and by means of the nerve communicates a certain sensation to the brain when these extremities are affected by any external object.—As long as the blood continues in a sound state, and can supply a certain quantity of these spirits, the person remains awake; but when the supply is interrupted, by whatever means, he necessarily falls asleep. This is the case with a person when moderately fatigued; the blood being then deprived in some measure of part of that animating principle which is necessary to the exercise of our external senses, or for keeping us awake. If the fatigue be carried to too great a length, the crasis of the blood itself is injured, and it becomes incapable of retaining the necessary quantity for carrying on the operations of life; which, though independent of our senses, are maintained by means of the same principle with them. Hence, though the person remains awake, he is far from being in health; and if the watchfulness continues for any considerable time, he is in great danger of becoming delirious.—After a person has taken a full meal, he is seized with drowsiness, because the fresh chyle continually pouring into the subclavian vein, requires the exertion of great part of the vital power to assimilate it to the blood, so that enough is not left to affect the senses so readily as usual. In like manner may we understand the sleep which follows the immoderate use of spirituous liquors, of large doses of opium, &c. These seem to act by rarefying the blood to such a degree, that the fine vessels are overstretched, and compress the small nervous fibres which every where accompany them, so as to destroy for a time their power of action. In the same manner do the vapours of charcoal or fixed air, anyhow applied, seem to act. Hence the best cure for persons affected by these things is to cool them as much as possible; and hence also we may see the reason why drunk people will bear an exposure to much greater degrees of cold, without injury, than such as are sober.—How cold itself induces sleep, is easily understood. The whole body is then so benumbed, that neither the blood can part with its animating principle, nor can the nerves take it up even if it should

do so; and hence the fatal sleep which ensues in such cases.

From what has been advanced concerning the nature of sleep, we may easily see, that its uses are to restore the spirits and strengthen the body, though too great indulgence in this respect has a contrary effect. The night is the most proper time for sleep, by reason of the absence of the solar light, which animates the whole creation, and in some measure prevents that waste of spirits which is the consequence of watching for any length of time. Hence we see why a person who has sat up all night finds a revival of his spirits in the morning; and why nocturnal watchings are prejudicial to health, even though a person should indulge himself in sleeping throughout the day.

Some animals require much more sleep than others, and many continue even for months in this state. For the human species six or seven hours are generally sufficient; though from habit many require eight, nine, or even ten hours. Those who addict themselves to study, in general require much sleep, on account of the great waste of spirits which intense thought occasions.

SLEEPERS, in natural history, a name given to those animals which sleep all winter; such as bears, marmots, dormice, bats, hedge-hogs, swallows, &c. These do not feed in winter, have no sensible evacuations, breathe little or none at all, and most of the viscera cease from their functions. Some of these creatures seem to be dead, and others return to a state like that of the fœtus before birth: in this state they continue, till by length of time maturing the process, or by new heat the fluids are attenuated, and the functions begin where they left off.

SLEEPERS, in a ship, timbers lying before and aft in the bottom of the ship, as the rung-heads do: the lowermost of them is bolted to the rung-heads, and the uppermost to the futtocks and rungs.

SLEIDAN (John), an excellent German historian, born of obscure parents, in 1506, at Sleidan, a small town on the confines of the duchy of Juliers. After studying some time in his own country, together with his townsman the learned John Sturmius, he went to France, and in 1535 entered into the service of the cardinal and archbishop John du Bellay. He retired to Strasburg in 1542, where he acquired the esteem and friendship of the most considerable persons, particularly of James Sturmius; by whose advice and assistance he was enabled to write the history of his own time. He was employed in some public negotiations; but the death of his wife, in 1555, plunged him into so deep a melancholy, that he lost his memory entirely, and died the year following. In 1555, came out, in folio, *De statu Religionis & Reipublice sub Carolo Quinto*, &c. in 25 books; from the year 1517, when Luther began to preach, to the year of its publication: which history was presently translated into almost all the languages of Europe. Besides this his main work, he wrote *De quatuor summis Imperiis, libri tres*; with some other historical and political pieces.

SLEIGHT OF HAND. See **LEGERDEMAIN**.

SLEUT-HOUNDE, the ancient Scots name of the blood-hound. The word is from the Saxon *slot*, the impression that a deer leaves of its foot in the mire, and

and bound, a "dog." So they derive their name from following the track. See the article *Blood-Hound*.

SLESWICK, an ancient and considerable town of Denmark, and capital of a duchy of the same name in the province of Gottorp, with a bishop's see, secularized in 1856. St Michael's church, which was the cathedral, is a magnificent structure, and has a chapter of noble ladies of the Protestant religion. This town was much more considerable than it is at present, it having suffered greatly by the wars of Germany. It is seated on the gulph of Sly, where there is a good harbour, 60 miles north-west of Lubeck, and 125 south-west of Copenhagen. E. Long. 9. 55. N. Lat. 54. 40.

SLESWICK, the duchy of, or *South Jutland*, is about 100 miles in length and 60 in breadth. It is bounded on the north by North Jutland, on the east by the Baltic Sea, on the south by Holstein, and on the west by the ocean. It contains 14 cities, 17 towns, 13 castles, 278 parishes, 1480 villages, 162 farms, 116 water-mills, and 106 gentlemens seats. It is a pleasant, fertile, populous country, and a sovereign duchy. Formerly the king of Denmark had half of it, and the other belonged to the house of Holstein-Gottorp; but the former having conquered this duchy, had the possession of it confirmed to him by the treaty of the north in 1720. In 1731, a prince of Bareith-Culmbach was made governor of this duchy, and resides at Gottorp.

SLIGO, an Irish county, in the province of Connaught, 25 miles in length, and as much in breadth; bounded on the east by that of Leitrim, on the west by the county of Mayo, on the north and north-west by the western ocean, and on the south and south-west by Roscommon and Mayo. It contains 5970 houses, 41 parishes, 6 baronies, 1 borough, and sends 4 members to parliament, two for the county, and two for the borough of the same name, which is the only market-town in the county, and is seated on a bay of the same name, 30 miles west of Killalla, and 110 north-east of Dublin. W. Long. 8. 40. N. Lat. 54. 12.

SLING, an instrument serving for casting stones with great violence. The inhabitants of the Balearic islands were famous in antiquity for the dexterous management of the sling: it is said they bore three kinds of slings, some longer, others shorter, which they used according as their enemies were either nearer or more remote. It is added, that the first served them for a head-band, the second for a girdle, and that the third they constantly carried with them in the hand.

SLOANE (Sir Hans, baronet), an eminent physician and naturalist, founder of the British Museum, was of Scottish extraction, and born at Killaleath in the north of Ireland in 1660. The earliest bent of his genius was to the study of nature, and this was encouraged by a proper education. He chose physic for his profession; and to attain a perfect knowledge of its several branches repaired to London, where he attended all the public lectures of anatomy and medicine, learned chemistry, and studied botany in Chelsea garden. His turn to natural history introduced him to the acquaintance of Mr Boyle and Mr Ray, which he carefully cultivated by communicating to them all his curious or useful observations. After spending four years in London, he went to Paris, where he attended the

hospitals, and heard the lectures of M. Tournefort, Du Verney, and other eminent masters. He then went to Montpellier; and having spent a year there in collecting plants, travelled through Languedoc with the same view, and in 1684 returned to London, when he presented to Mr Ray a great variety of plants and seeds, which the latter has described, with proper acknowledgments, in his *Historia Plantarum*. About this time he became acquainted with Dr Sydenham, who took him into his house, and recommended to him in the warmest manner to practise. Soon after, he was chosen a fellow of the Royal Society and of the college of physicians. But his desire to make new discoveries in natural history, induced him to make a voyage to Jamaica, in quality of physician to Christopher duke of Albemarle governor of that island; and though he staid there but 15 months, he brought from thence such a variety of plants, as greatly surprised Mr Ray, who did not think there had been so many to be found in both the Indies.

Dr Sloane now applied himself closely to his profession; and on the first vacancy was chosen physician to Christ's-hospital: but he applied the money he received from his appointment to the relief of those who were the greatest objects of compassion in the hospital, being unwilling to enrich himself by the gains he made of giving health to the poor. In 1693 he was chosen secretary to the Royal Society; and immediately revived the publication of the Philosophical Transactions, which had been omitted for some time, and continued to be the editor of them till 1712. As in his earliest days he had been fond of natural knowledge, he enriched his cabinet with every thing that was curious in art or nature; but this received a great augmentation by a bequest of William Courten, Esq; who had employed all his time and the greatest part of his fortune in collecting curiosities. The sense which the public entertained of this learned physician's merit evidently appears by the following honours conferred upon him. He was created a baronet by king Geo. I. chosen a foreign member of the royal academy at Paris, president of the college of physicians, and, on the death of Sir Isaac Newton, president of the Royal Society. He was the first in England who introduced the use of the bark into general practice, not only in fevers, but in a variety of other distempers, particularly in nervous disorders, in mortifications, and in violent hæmorrhagies. His receipt for diseases in the eyes is well known, and warranted by success. Having faithfully discharged the respective duties of the places which he filled, he retired in 1740, at 80 years of age, to Chelsea, to enjoy in a peaceful tranquillity the remains of a well-spent life. He here continued to receive the visits of people of distinction, and of all learned foreigners; and admittance was never refused to the poor who came to consult him in case of sickness. It is remarkable, that at 16 years of age he had been seized with a spitting of blood, which confined him to his chamber for three years, and that he was always subject to it; yet, by his sobriety, temperance, and moderation, with the occasional use of the bark, he protracted his life to a great length, without even feeling the infirmities of old age; and, after a short illness of three days, died in 1752, in his 91st year.

He was a liberal benefactor to the poor, and a governor

Sloane
||
Smalkald.

vernor of almost every hospital about London, to each of which he gave considerable benefactions. He zealously promoted every proposal that had for its object the public good. He laid the plan of a dispensatory, where the poor might be furnished with proper medicines at prime cost; which, by the assistance of the college of physicians, was afterwards carried into execution. He gave the apothecaries company the entire freehold of their botanical garden at Chelsea, in the centre of which is a statue of him in marble, admirably well executed by Mr Rysbrack. In 1732 he exerted himself in promoting the establishment of the colony in Georgia; in 1739, of the foundling-hospital, and formed the plan for bringing up the children. His noble cabinet of curiosities he bequeathed to the public, on condition that the sum of 20,000*l.* not half the original cost, should be paid to his family; and also his library, consisting of above 50,000 volumes, 347 of which were illustrated with cuts coloured from nature, and 3566 manuscripts. He wrote the *Natural History of Jamaica*, in 2 vols folio.

SLOOP, a small vessel furnished with one mast, the main sail of which is attached to a gaff above, or to the mast on its foremoft edge, and to a long boom below, by which it is occasionally shifted to either quarter. See **VESSEL**.

SLOOP of War, a name given to the smallest vessels or war except cutters. They are either rigged as ships or frigates.

SLOUGH, a deep muddy place. The cast skin of a snake, the damp of a coal-pit, and the scar of a wound, are also called by the same appellation. The slough of a wild boar is the bed, soil, or mire, wherein he wallows, or in which he lies in the day-time.

SLUCZK, a large and populous town in Poland, in Lithuania, and capital of a duchy of the same name; famous for three battles gained here, by Constantine duke of Oltrog, over the Tartars, in the reign of Sigismund I. It is seated on the river Sluczka, 72 miles south-east of Minsk, and 70 south of Novogrodeck. E. Long. 28. 24. N. Lat. 52. 36.

SLUICE, in hydraulics, a frame of timber, stone, earth, &c. serving to retain and raise the water of the sea, a river, &c. and on occasion to let it pass: such is the sluice of a mill, which stops and collects the water of a rivulet, &c. in order to discharge it at length, in greater plenty, upon the mill-wheel: such also are those used in drains, to discharge the water off lands; and such are the sluices of Flanders, &c. which serve to prevent the waters of the sea overflowing the lower lands, except when there is occasion to drown them. See **CANAL**.

SMACK, a small vessel, commonly rigged as a sloop or hoy, used in the coasting or fishing trade, or as a tender in the king's service.

SMALAND, or **EAST GOTHLAND**, a province of Sweden, which makes part of Gothland; and is bounded on the north by Oltrogothia or east Gothland, on the east by the Baltic Sea, on the south by Schonen and Bleckingia, and on the west by Westrogothia or West Gothland. It is about 112 miles in length, and 62 in breadth; Calmar is the capital town.

SMALKALD, a town of Germany, in Franconia, and in the county of Henneburg; famous for the confederacy entered into by the German Protestants,

against the emperor, commonly called the *league of Smalkald*. The design of it was to defend their religion and liberties. It is seated on the river Werra, 35 miles south-west of Erford, and 50 north-west of Bamberg. E. Long. 10. 37. N. Lat. 50. 43. It is subject to the prince of Hesse-Cassel.

SMALLAGE, in botany. See **APIUM**.

SMALT, or **ZAFFRE**, is a blue glass composed of the calx of cobalt vitrified with some frit of glass or crystal. Ground smalt is called *azure* or *enamel blue*. See **ZAFFRE**.

SMARAGDUS, in natural history. See **EMERALD**.

SMELL, **ODOUR**, with regard to the organ, is an impression made on the nose, by little particles continually exhaling from odorous bodies: With regard to the object, it is the figure and disposition of odorous effluvia, which, striking on the organ, excite the sense of smelling: And with regard to the soul, it is the perception of the impression of the object on the organ, or the affection in the soul resulting therefrom.

The principal organs of smelling are, the nostrils and the olfactory nerves; the minute ramifications of which latter are described throughout the whole concave of the former. See **ANATOMY**, n° 404.

SMELT, in ichthyology. See **SALMO**.

SMELTING, in metallurgy, the fusion or melting of the ores of metals, in order to separate the metal-line part from the earthy, stony, and other parts. See **METALLURGY**, Part III.

SMILAX, **ROUGH BINDWEED**; a genus of the hexandria order, belonging to the diccia class of plants. There are 10 species, eight of which are hardy and will bear the winters of this country; the others require to be kept in a green-house. They are evergreen climbing plants, that with proper support will rise to a great height. They are well adapted for thickets, groves, wildernesses and wood works, planting them towards the front between the trees and shrubs, where they will run and spread very agreeably. They may be propagated by layers, cuttings, or seeds.

SMITH (Edmund), a distinguished English poet, the only son of Mr Neale an eminent merchant, by a daughter of baron Lechmere, was born in 1668. By his father's death he was left young to the care of Mr Smith, who had married his father's sister, and who treated him with so much tenderness, that at the death of his generous guardian he assumed his name. His writings are not many, and those are scattered about in miscellanies and collections: his celebrated tragedy of *Phædra* and *Hippolitus* was acted in 1707; and being introduced at a time when the Italian opera so much engrossed the polite world, gave Mr Addison, who wrote the prologue, an opportunity to rally the vitiated taste of the public. However, notwithstanding the esteem it has always been held in, it is perhaps rather to be considered as a fine poem than as a good play. This tragedy, with a Poem to the memory of Mr John Phillips, three or four Odes, with a Latin oration spoken at Oxford in *laudem Thomæ Bodleii*, were published as his works by his friend Mr Oldisworth. Mr Smith died in 1710, sunk into indolence and intemperance by poverty and disappointments; the hard fate of many a man of genius.

SMITZ (Gaspar), who, from painting a great number

Smithery,
Smoke.

number of Magdalens, was called *Magdalen Smith*, was a Dutch painter, who came to England soon after the Restoration. For these portraits sat a woman that he kept, and called his wife. A lady, whom he had taught to draw, took him with her to Ireland, where he painted small portraits in oil, had great business and high prices. His flowers and fruit were so much admired, that one bunch of grapes sold there for 40 l. In his Magdalens he generally introduced a thistle on the fore-ground. He had several scholars, particularly Maubert, and one Gawdy of Exeter. Yet, notwithstanding his success, he died poor in Ireland, in 1707.

SMITHERY, a manual art, by which an irregular lump of iron is wrought into any intended shape by means of fire, hammering, filing, &c.

SMOKE, a dense elastic vapour, arising from burning bodies. As this vapour is extremely disagreeable to the senses, and often prejudicial to the health, mankind have fallen upon several contrivances to enjoy the benefit of fire, without being annoyed by smoke. The most universal of these contrivances is a tube leading from the chamber in which the fire is kindled to the top of the building, through which the smoke ascends, and is dispersed into the atmosphere. These tubes are called *chimneys*; which, when constructed in a proper manner, carry off the smoke entirely; but, when improperly constructed, they carry off the smoke imperfectly, to the great annoyance of the inhabitants. As our masters at present seem to have a very imperfect knowledge of the manner in which chimneys ought to be built, we can hardly perform a more acceptable service to the public than to point out the manner in which they ought to be constructed, so as to carry off the smoke entirely; as well as to explain the causes from which the effects so often complained of generally proceed, and the method of removing them.

Although we would naturally imagine, that the causes which occasion smoke in rooms are exceedingly various, yet, upon examination, it will be found, that they may all be reduced to one of these three general heads, each of which will admit of several varieties.

I. To a fault in the form of the tube or chimney itself.

II. To some fault in the other parts of the building, and a wrong position of the chimney with respect to these. Or,

III. To an improper situation of the house with respect to external objects. And as it is of the utmost consequence, in attempting a cure, accurately to distinguish from which of these defects the smoke proceeds, it will be necessary to point out with care the several phenomena which are peculiar to each.

I. Of smoke occasioned by a fault in the form of the chimney itself. But, before we proceed, it will be necessary to premise something with regard to the general cause of the ascent of smoke in chimneys.

The earth is every where surrounded with a great body of air called the *atmosphere*. This air is an elastic fluid subjected to many particular laws, as hath been elsewhere fully explained. In particular, it hath, like other fluids, a constant tendency to preserve an equilibrium in all its parts; so that if at any time the weight of it at one place is diminished, the heavier air rushes from all sides towards that point, till the

equilibrium be again restored. It is likewise known, that heat is one of the most powerful means of disturbing this general equilibrium of the air, by expanding it to a great degree, and making the same quantity occupy a much greater space than it did before, and consequently become lighter. Hence it necessarily follows, that wherever a fire is kindled, the air immediately contiguous to it will be heated, and of consequence rarified and made light; which must ascend into the higher regions of the atmosphere, till it becomes of the same gravity with the air contiguous to it; while the denser cold air below rushes toward the point from which it departed, is there heated and rarified in its turn, and ascends in the same manner, carrying the smoke or vapour arising from the burning body along with it. In this manner that constant suction of air towards every fire is produced, and from this cause proceeds the constant tendency of smoke to ascend upwards from the surface of the earth. But as the body of our atmosphere is often agitated with wind, &c. and as it is an elastic fluid, it endeavours to spread itself every way; from which causes the warm air would quickly be diffused among the cold air before it could arise to any considerable height; so that the smoke would always remain low, and be tossed about near the surface of the earth: all of which inconveniences are avoided by confining this heated air in a tube, which prevents it from mixing with the external air, till it arrive at the height to which we desire it should ascend.

To render this still more clear, see Plate CCLXXI. where AB (fig. 1.) represents the tube of a chimney, having a fire at the bottom at A. It is obvious, that, in this situation, the air which was heated by the fire at A will ascend directly upwards, without mixing with the external air, till it arrives at B, beyond which it will be at liberty to disperse in the atmosphere; and the more weighty air which presses in to supply its place can have no access to it but at the opening between A and E, where it also is heated by the fire, and in its turn ascends to the top of the chimney, thereby occasioning a constant stream of air to ascend up the vent, which carries the smoke along with it. This is the manner in which fuliginous vapours are made to ascend in chimneys; and by attending to it, we may draw the following corollaries with regard to the construction of this useful part of our habitations.

Ist, The higher the chimney, that is, the greater the distance between the fire-place and the top of the chimney, the greater will be the difference between the weight of the column of heated air in the tube, and another column of the atmosphere of the same diameter without the chimney; and consequently the air will enter with the greater force at the opening AE, and carry up the smoke more readily along with it: for as the warm air within the tube continues rarified to a high degree till it issues from the top of the chimney, and is, in every part of its length, lighter than the same bulk of external air marked by the dotted line CD, it follows, that the longer these two columns of unequal gravity are, the greater must be the difference of their weight. Hence it is that high chimneys (*ceteris paribus*) have a greater suction of air, and are less liable to vent ill, than low ones. A smoky chimney may therefore sometimes be cured by raising it higher.

Smoke.

Smoke. higher. It is likewise obvious, that if any opening is made into the chimney, as at F, the air will enter with less force at E, and carry up the smoke with less velocity, and by that means be in danger of producing smoke in the room; for this opening, as it admits the fresh air into the tube, has nearly the same effect as shortening the tube so much would have.

2d, As the smoke is forced up the chimney merely by the rarefaction of the air in consequence of heat, it is evident, that the more the air is heated, with the greater force (*ceteris paribus*) it will ascend, because the difference between the weight of the external and internal air will be greater; and as the air will be the more heated the nearer it is made to pass by the fire in its entry into the chimney, it is evident, that the smaller the opening at AE is, or, in other words, the lower the mantle of the chimney is, the air will be forced to pass the nearer the fire, and therefore be more rarefied, and ascend with the greater velocity; so that lowering the mantle of the chimney will often cure smoke.

But it is frequently inconvenient to have the mantle of the chimney too low. However, the same effect may often be produced by another contrivance. For as the fire-place is usually made wider than the length of the grate, a great deal of cool air passes at the two sides of the grate, without being much heated. This greatly diminishes the suction of the chimney; but it may easily be prevented by building up the vacancies at each side of the grate, so as to allow no air to enter from below, except what comes immediately through or before the fire. For this purpose, grates consisting of a neat hewed stone at each end, with a breast and bottom of iron fitted to them, as represented at fig. 2. are extremely convenient. But the aperture of the chimney is often not suddenly contracted above the mantle, but goes up tapering slowly, as in the same fig. 2. This structure allows a quantity of cool air to enter at the two corners of the mantle, and steal up the tube without coming near the fire. The most easy and effectual method of remedying this defect, is to place a sheet of milled iron within the mantle on each side, as low down as possible, making them slant a little upwards towards the middle of the chimney; as at A, fig. 2. the mantle being represented by the dotted line. By this contrivance, the air, which enters at the side of the mantle, before it can ascend into the chimney, is forced to pass very near the fire, and of course is much rarefied. The good effects of this would be still more strongly felt if one of these plates were placed a little lower than the other, and made so long that the ends should cross each other, as at AB, fig. 2. by which means every particle of air that went up the chimney behaved to pass immediately above the fire. It is almost unnecessary to observe, that these plates ought to be so contrived as to be taken out at pleasure to allow the chimney to be cleaned.

A chimney may not only be defective by having the mantle too high, or by being too wide from side to side, but also by being too deep between the fore-side and the back, as is often the case in very old houses. In this case, the distance between the fire and the mantle is so great, that much air passes up without being sufficiently rarefied, as is represented at fig. 3. This may be sometimes cured by bringing the grate a little for-

ward, which, by making the fire act more powerfully upon the mantle, rarefies the air more in its passage. But this can seldom produce the desired effect, and it often does harm: for when the grate is brought forward, there is a great vacancy left between it and the back of the chimney, so that the air passes under the grate, and ascends behind it very little rarefied; so that if the feet of the grate are not very low, there will be as much lost in this way as will be gained in the other; and as there is not enough of heated air in the chimneys of this kind to make the vapour ascend with rapidity, they are often choked with thick fuliginous vapours hanging in them, almost in equilibrio with the rest of the atmosphere, so that the least puff of wind beats them down the chimney, and pushes the smoke into the room; whereas, when it is far back, it is driven down upon the hearth, and rises upwards again when the gulf is over, and a great deal of it is caught within the mantle as it rises, which in the other case would have been dispersed through the room. When this is the case, the most effectual method of cure is, to bring the grate forward till the fore-part of it is immediately under the inner edge of the mantle; then build up the vacancy at the back of it the whole width of the fire-place from side to side, raising it perpendicularly till it is as high as the back of the grate, and then bending it forward towards the mantle, as is represented at fig. 4. When it is as high as the workman can reach, let it be suddenly turned backward again, sloping a little upward, as in the figure; then fit a sheet of milled iron to the inside of the mantle, making it slant a little upward toward the back-part, at a small distance above the new-erected masonry, and extending within a few inches of the back-wall, as at A, fig. 4. By this construction, all the air that enters into the chimney is made to pass immediately above the fire, between it and the heated iron, upon which the flame acts with the greater force, as the back of the fire-place is bent a little forward above the grate, and the heat is likewise reflected into the room with the greater force: at the same time, if the smoke is at any time beat down the chimney by a sudden gust of wind, it will be caught by the sheet of iron, and prevented from coming into the room. If the fire place be very wide between the one side and the other, the new masonry may be carried quite up to the sheet of iron on each of the sides.

3d, As every fire requires a constant succession of fresh air, the tube for conveying this rarefied air to the higher regions of the atmosphere must be of a sufficient size to contain the whole of it, and allow it a ready passage; otherwise a part of it will be forced to seek some other passage; by which means the apartment in which the fire is placed will be constantly filled with smoke. Every chimney, therefore, ought to have a degree of wideness sufficient to carry off the whole of the smoke arising from the fire usually burnt in it, otherwise the apartment will be almost continually filled with smoke. This is a fault more common at present than any of those already mentioned, especially in large towns, where the number of chimneys in one wall is often so great that it is difficult to get a sufficient space for each. The most obvious cure, where the situation admits of it, is to widen the chimney, by opening a hole a little above the grate thro'

Smoke.

Smoke.
Plate
CCLXXI.

Smoke.

Fire.
CCLXXI,

the back-wall of the chimney, slanting a little upward, and building on the outside of the wall a small chimney open from that hole to the top of the building, as in fig. 5. where AB represents the new tube going through the wall at the opening at A, which will receive the superfluous smoke, and carry it off. This additional chimney must always be carried as high as the other. But as there are many situations in which this method of cure would be impracticable, we must try every method for accelerating the ascent of the smoke, (for the more quickly it ascends, the more narrow may the tube be); and with that view the chimney may be heightened at top, and contracted at bottom, in any or all the various ways we have mentioned. But if none of these methods prove effectual, let the chimney be built quite close at the under part, leaving only as much room as is sufficient to contain the grate, having a cover of metal fitted to that opening, which can be taken off or put on at pleasure; by which the whole air that enters into the chimney is made to pass through the fire like a furnace, and carries the smoke up it with great velocity. These are well known in large towns by the name *smoke-chimneys*: but as they occasion a prodigious waste of fuel without warming the room, and, unless attended with very great care, are in danger of setting the building on fire, they ought to be as much avoided as possible. But if neither this nor any of the other methods prove effectual, the wall must either be taken down and rebuilt in a proper manner, or the chimney abandoned as incurable. As this is a defect more difficult to be remedied than any other, we would strongly recommend it to every builder to build his chimneys of a sufficient width throughout: there is no danger of erring on this extreme, as it is easy to remedy any defect that might arise from it.

4th, As the air which ascends through the chimney continues nearly of an equal degree of heat to the top, the tube should be of an equal degree of width at the top as at the bottom, as well as through the whole of its length. It ought not therefore to be made tapering gradually from the fire-place to the top, but to be suddenly contracted above the grate, as in fig. 6. from which it ought to be continued of an equal wideness throughout its whole length; but if it is narrower at one place than another, it ought to be at the under part, immediately above the fire, for a very short space; because, as this is within reach of the hand, the foot can be cleaned from it as often as is necessary; so that when the other parts of the chimney are clogged with soot, they will not be narrower than this place is at that time.

5th, It seldom happens that a chimney can be carried quite straight upwards: and it is an advantage that it is so, as they ought always to be bent a little. For if a chimney be straight, and of a proper width to transmit the whole of the smoke and no more, it will not be sufficient for that purpose, when there is a heavy fall of rain, or snow, or hail, with little wind; for the great drops will fall perpendicularly from the top to the bottom of the chimney: and as they occupy a considerable space, the smoke will not have room to ascend, but must be forced down with the shower, and dispersed in the apartment; whereas, if the chimney is bent, the rain falls upon some of the

sides, and glides gently down, without disturbing the ascent of the smoke. The same inconvenience will be felt in a straight chimney, where it is so placed as to be exposed to winds, which sometimes enter the top, and blow down with a sudden puff: for if it be straight, the air meets with no interruption till it descends into the chamber, and there disperses the smoke; but if it be crooked, the descent of the wind will be obstructed, its force broken, and the bad effects of it in a great measure prevented. Upon the whole, bent chimneys are always preferable to straight ones. However, a perpendicular chimney may be easily cured by some of the contrivances after mentioned.

These are the most general defects arising from the structure of the chimney itself, which are all reducible to the following causes: 1. Too little height; 2. Too great wideness of the bottom of the chimney; 3. Too little width; 4. Unequal wideness between the top and bottom; and, 5. Straightness of the tube. We have pointed out the best methods of curing each of these defects; and, to finish our remarks on this general head, and give the reader a more perfect idea of the best form of construction for a chimney, we have drawn two different sections of one constructed on the justest principles, in figures 6. and 7. the several parts of which appear so plain from the figures, and the reasons for this construction have been already so clearly assigned, that a very short explanation will be sufficient. Fig. 6. represents a front-view of the fire-place; supposing the fore-part of the wall taken down, and the chimney laid bare from top to bottom; AB and DC, representing the two sides of the fire-place; and BC, the mantle, being cut through, to show the manner in which the aperture is suddenly contracted, immediately above the fire within the mantle. The tube from the point E to the top ought to be of an equal wideness, and bent in any direction that may be convenient. The two planes FF, represent the two sides of the fire-place, which ought to be as much sloped inward towards the back as the form of the grate will admit of; for the more they are inclined, the more powerfully will they reflect the heat into the apartment. Fig. 7. represents a perpendicular section of the wall, through the middle of the chimney, to discover its shape, if viewed from a side. And here it is to be observed, that it ought ever to be a rule to bring the building at the under part of the chimney immediately behind the grate, as far forward as possible, because this throws more heat into the chamber than if it were placed farther back: but as the fore-part of the grate ought never to project beyond the inner edge of the mantle, care should be taken to have the under part of the mantle wrought as thin as the nature of the materials will admit of, making it thicker towards the upper part, so as to slope inwards above the fire, as represented at B, fig. 7. To throw the heat outward, let the upper part of the back of the fire-place be a little inclined outward, as at C; but after it is carried up in this manner a little higher than the mantle, let it be suddenly turned back as in the figure, the projection above the mantle inclining backward in the same direction, being carried up to the top at an equal wideness the whole way.

Although it is necessary to have all chimneys pretty wide, yet this on many occasions is attended with inconvenience.

Smoke.

Smoke.

Plate
CGLXXI.

conveniences: for as they transmit a great quantity of heated air, too large a portion of that warm air which ought to heat the chamber is carried off; and as it is only when the fire is first kindled that the great quantity of gross vapour is exhaled, which fills the chimney, and maketh a large tube necessary, if it were so contrived as to contract or dilate at pleasure, we might have our chimney of a sufficient width to convey away the greatest quantity of smoke that could ever have occasion to pass through it, at the same time that we might never allow more air to pass off at other times than was necessary to carry away the whole of the smoke, by which means a much smaller quantity of fuel would keep our apartment equally warm. This, we apprehend, might be accomplished by the following simple apparatus. Let a sheet of milled iron be fixed at the upper part of the mantle, on the inside, at B, in such a manner as that, by means of a small wire *d*, passing through a small hole left for that purpose in the fore-part of the chimney, it might be let down at pleasure towards C, or drawn up towards B, so as to apply quite close to the upper edge of the chimney between B and C. This would leave the tube of its full wideness when necessary, or close it to any degree at pleasure, with the greatest ease (A.) It is unnecessary to add, that the plate at A, fig. 4. might be employed in the same manner, when it should be found convenient. So much for what relates to the construction of the chimney itself. We now proceed to consider the second general cause of smoke, viz.

II. Of smoky houses proceeding from faults of other parts of the building, altogether independent of the structure of the chimney itself.

1st, The first we shall mention is too great closeness of the room. Smoke, as shown above, is impelled up the chimney by the pressure of the air entering at the fire-place and ascending upwards; but if fresh air is not admitted into the apartment in sufficient quantities to supply the consumption by the fire, the room will be quickly exhausted, and the air in it become as light as the external air at the top of the chimney, so that the smoke will as readily be dispersed into the chamber as through the chimney. But if any door or window is opened so as to admit plenty of free air, the smoke will be quickly dispelled, and the proper circulation established: the same effect will be produced by making a small hole in some of the sides of the room; but unless this be done with some judgment, it may frequently add to the disease, as it may concur with some of the other causes of smoky houses, to be afterwards mentioned. A better method of remedying this evil would be to have a small hole made in the wall at the back of the chimney, and immediately underneath it: or a small perforation, made in the wall in any other convenient manner; the one

end of which should communicate with the external air, and the other communicate with the chamber in any place near the grate, and as low down as possible, through which a constant supply of air would be administered to the fire without the smallest inconvenience or trouble. If this were practised, doors and windows might with safety be made much closer than at present, and our apartments rendered equally warm and comfortable with a much smaller quantity of fuel than we use at present. For as the fire, in the present mode of constructing chambers, is kept alive by a constant succession of cold air from the doors, windows, and other crannies of the room, rushing towards the chimney in all directions, the air of the room, which, if not cooled by this means, would be quickly heated to a great degree, is constantly kept cold, in spite of the strong heat of a blazing fire; which, at the same time that it scorches the parts of our body which are most exposed to it, does not warm the parts which are turned from it; and we experience at the same time a burning heat and piercing cold, which is often productive of the most disagreeable effects. But if the fire were supplied with air in the manner above-mentioned, there would be less air drawn in through the crannies of the room, so that the air within would be soon warmed, and continue long so, even with a small degree of heat. However improper this might be for people in perfect health, it might surely be of great use for those who are in a weakly habit of body; especially if care were taken to carry off the foul air, by having a small tube leading from the upper part of the room to the top of the house, through which the air, which had been rendered noxious by the smoke of candles or perpiration, would be conveyed away, and a succession of fresh air admitted from the tube near the fire-place, to supply that want. That the reader may more readily comprehend what is here meant, we have represented in fig. 6. a view of two small tubes for this purpose, supposed to be laid open by taking away the boxing or inner coating of the wall which ought to cover them. These are of wood, and must not be above one inch in diameter. One end, *g g*, goes quite through the outer wall of the house, and communicates with the open air, having a small grate upon it to prevent vermin from entering. The other end, *h h*, passes behind the two slabs, at the side of the fire-place, and open in the inside of the fire-place at *i i*, at which place they have each of them a small bit of brass fixed to them, being closed with two sliding doors exactly like those that are used to cover the end of telescopes, by means of which more or less air may be admitted at pleasure.

2d, A second cause of smoke is the wrong position of doors and windows with respect to the fire places.

As the smoke is impelled up the chimney by the pressure

40 Y 2

pressure

(A) If any one should think, that the wire *d* would be a disagreeable object in the middle of a chimney-piece, it might easily be hid by a picture of any kind. The wire might be fixed to a small brass handle, moving freely upward and downward like that for a bell; only this should have a long slit in the middle of it, with notches on each side, to receive a pin placed in the middle of the slit, by means of which the wire might be lengthened or shortened at pleasure. The whole of this apparatus is represented at fig. 16, where (a) represents the wire fastened to the brass plate; (b) a piece of brass, raised a little, to serve as a handle. The slit in the middle is represented by the dark line, having notches, *c c c*, at convenient distances. The pin *d* is fixed into the wall, but left at liberty to turn about with ease; and its head stands up a little, so as to be easily turned with the finger and thumb. The body of this nail is made so thin in one direction, that when it is turned half round, it easily passes thro' the slit in the plate; but in the other direction its diameter is greater, so that when the plate is brought so as to have one of the notches opposite to the nail, and it is then turned half round, it catches the plate so that it cannot be moved till the nail is again turned about.

pressure of the air, if that air is driven away from the fire-place by any cause more powerful than the suction occasioned by the fire, the smoke must also be drawn away with it, and follow the same directions with that current of air; so that whatever tends to draw a current of air from the under-part of the chimney, will also tend to produce smoke in the house; from whence it is easy to conceive how doors or windows may occasion smoke when the wind is in certain directions. Thus, suppose a chamber, A, B, C, D, fig. 8. having a door or window at E, another at F, and a fire-place at G; when the wind is in the direction DA or CB, the general current of air will occasion a sort of suction at the opening E, so that the air will be drawn from the chimney G towards E: and if the current be strong, and the opening at E large, it will become more powerful than the suction of the chimney, and produce smoke in the apartment. If the window at F should be opened in this case, it would not mend the matter; for any wind which should enter at F, would be carried straight out at the opening E, and the current of air would be drawn from the chimney as strong as ever. If the window at E were shut, and that at F left open, and the wind still continued in the same direction as before, the current of air rushing past the window would have a tendency to draw the air of the room along with it, and occasion smoke, but not so powerfully as if the window at E were open; but if the wind were in the direction DB, it would be very bad: but if it blew in the direction CA, the case would be very much altered; for then a quantity of air being forced in at the opening F, and finding no ready passage, it would be pent up in the chamber, and force itself up the chimney with violence. We omit mentioning what would be the effect if the wind were in other directions, as it is imagined these will be sufficiently obvious to every attentive observer. It is only necessary here to observe, that as doors or windows are seldom so exactly made, but they produce some effect, as they always admit some air even when shut, and often occasion smoke when the wind blows from a particular quarter; and as workmen and others generally apprehend, when houses are troubled with smoke in this manner, that it is occasioned by some external cause, and apply their attention to cure it by altering the top of the chimney, which never can produce the smallest service in this case; we would recommend a more particular attention to be paid to the situation of doors and windows than is generally bestowed; especially in such situations where they are exposed to any violent current of air in a particular direction, as in narrow lanes, or defiles of any sort, where the wind, when in particular directions, is hurried along with a prodigious rapidity. And, that the effects of different positions may be still more obvious, we shall produce several other examples.

Suppose a chamber, fig. 9. having a door at A, and two windows B C, with a fire-place D. If the wind came in the direction DA, and if the door transmitted as much or more air than was admitted at both the windows, a current of air would run from all parts of the chamber towards A, and therefore would have a tendency to occasion smoke: but if as much or more air came in at the windows than could get out at the door, there could be no such current; but, on the

contrary, it would be forced up the chimney, and carry the smoke along with it: wherefore, in this situation, a room might sometimes be cured of smoke, by making the door as close as possible; nothing could be more hurtful in this case than boring a hole in the door. But if the house was in such a situation as to be more frequently exposed to a wind which came in the direction of A D, it would run little risk of being troubled with smoke.

Suppose a room, fig. 10. having a door at A, and two windows B and C, with a fire-place D. If the wind came in the direction CB or BC, and both the windows were open, it is evident that the smoke would be drawn from the chimney by the strong current of air passing through the room; or if the window upon which the wind came were closed, and the opposite one open, nearly the same effect would be produced: but if the window upon which the wind blew were open, and the opposite one and the door shut, the room would be immediately cleared of smoke entirely. In this situation, it is evident, that if the windows were badly made, so as to admit much air, it would tend to occasion smoke, especially if the door were in the same situation; it is therefore of consequence to attend to this circumstance in a situation similar to this.

Having premised so much with regard to single rooms, we shall now proceed to consider a more compound structure. Thus, let fig. 11. represent a building consisting of two chambers, K L, joined by a passage. The chamber K having a door B communicating with the passage, a window F, and fire-place G; and that at L having a door C, another door or window D, the window E, and fire-place H, the entry to the whole being by the door A. Let us now consider what would be the effect of the wind coming from different directions upon this building. And first, suppose the wind blew in the direction AM: If all the doors and windows were close shut, and very little air were admitted, there would be little risk of smoke; but as there would surely be some admitted through these different openings, there would be some chance that the chamber L would be troubled with smoke, because some of the air which forced its passage thro' the chinks of the door A would pass through the doors C and D, which might produce smoke in a small degree. There would be little chance that the chamber K would smoke in this case; because although there is a general suction through the passage from B to D, yet as it is in some measure interrupted by the close door at C, it will be but small; and as the wind is interrupted in its course by the wall of the passage, some of it will be forced through the chinks of the window E, which would more than counterbalance the effects of the other suction. But if the door D were open, both the chimneys would smoke; especially if the doors B and C were open also, as the current would be then very strong towards that point. But in all cases the smoke of this house would be prevented by keeping the door at D shut, and that at A open; but if the house was in such a situation as to be more exposed to that wind than any other, it would be better to close up the door D altogether. If the wind more commonly came from M towards A, it is more than probable that a house situated like this would be quite free of smoke, as the general current of air would be

Smoke.
Plate
CCLXXI.

towards the chimneys; but the chamber K would run greater risk than L, as the suction might sometimes be drawn towards the window F; but if the door A were in the opposite side of the passage, that inconvenience would be avoided also. If the more general current of air were from K towards L, this house behaved to be troubled with smoke, unless the windows were very close; but there would not be the smallest chance for that when it came from L towards K.

We might now proceed to give more examples of this sort: but as it would be impossible to enumerate all the variety of cases that might occur, it is imagined that these will be sufficient to give the reader an idea of the manner in which any building ought to be examined in this respect; and he must be left to his own discretion to apply the principles above explained to all the variety of cases that may occur. In large complicated buildings, it no doubt requires a greater extent of thought to combine all the various circumstances together, and draw a general conclusion, than in smaller and more simple ones; but if the following general rules are attended to, the complaints arising from this cause would be but few. 1st, Avoid as much as may be long passages leading to very distant parts of a building, as there is often a strong current of air in these which helps to disturb the free circulation of air up the chimneys. 2d, Place the chimneys in general in that side of the apartment towards which the wind which in general prevails most in the situation where the house is placed blows. And, 3d, make as many, if not more, doors and windows (especially such as have occasion to be most frequently open) on that side of the building *from whence* the most prevalent wind does come.

III. The third general cause of smoke in houses is the wrong position of the house with regard to external objects, which, by interrupting the course of the air, makes it assume various directions, and wheel about in eddies, so as to prevent it from ascending with ease from the chimney-top, or beats it down into the room with violence. This is more seldom the cause of smoky houses than either of the two before-mentioned; although it seems to be almost the only one attended to by the persons who pretend to cure smoky houses at present, as most of their remedies are adapted to remove the disorders arising from this cause alone. We shall briefly point out the several cases in which this can occur, that every one may be enabled to judge for himself when these cures are proper or not.

The air (as has been said) is a fluid, and wind a current of that fluid; which, when driven along the surface of the earth, flows with a smooth and equal stream, unless when opposed by some object which interrupts its course; but when it meets with any object which directly opposes its course, it is in some measure pushed back again, and made to spread on every side, till it meets with some open side, towards which it flows with great impetuosity. It is likewise a fluid of considerable gravity, and therefore presses upon the surface of the earth with great force; so that, when a current of it flows along the surface of our globe, it has a tendency to move forward and press downward at the same time: from whence it happens, that when a current of air is forced over the top of any high object, the side of which descends perpendicularly down-

ward, the velocity of the current at first overcomes the gravity, and it flies a short way over in that direction; but the power of gravity acting upon the under surface, draws it downward, and in a short time overcomes the impetus that it had to rush forward, and occasions a sort of eddy nearly similar to what we see among water behind a stone which interrupts the violence of its currents.

To illustrate this more plainly, let A B, fig. 12. represent a part of a high building, near to which is a smaller one C D; and let the dotted line E F represent a current of air flowing with considerable force in the direction F E. It is plain that it will flow straight forward over the top of the small building; but when it meets with the large object, it will be interrupted in its course, and spread itself on every side, as represented by the dotted lines G G, &c. at last it will flow towards that place through which it can escape with the greatest ease. If the opposing object be large, and has no opening through which it can issue near the ground, then it will ascend to the top of it, and flow off in that direction, carrying the smoke which ascends from the small chimney C along with it: but if there is any opening below, either a street or lane, or any other passage that will admit the wind to pass, then will the natural gravity of the air draw the general current downward to flow off through the lower passage; in which case, the smoke which ought to ascend through the chimney C, meeting with a current of air opposing its passage, will not be at liberty to issue forth, but be forced back again into the room from whence it proceeded, unless some contrivance is fallen upon to prevent it.

Again, let A, fig. 13. represent a small building at the side of a great rock B, and the wind coming in the direction C D; when the current of air comes to the point D, being hurried forward with great velocity, it goes a little forward, but soon descends downward, and gradually is reflected more and more inward, as represented by the dotted lines E E, &c. so that, descending downwards upon the top of the chimney A, the smoke is beat back again into the apartments. Thus it is that in low houses, when contiguous to high objects, are in danger of being disturbed with smoke. If the contiguous object be not very high, the disorder may be cured by heightening the chimney of the low house; but if it is very high, it will be necessary to cover the top of the chimney in such a manner as to prevent the wind from entering it, at the same time that a passage is left at some of the sides through which the smoke may issue with freedom. Many are the contrivances which have been invented for this purpose, which are to be met with every-where; and as there is no difficulty in accomplishing the desired end by an infinite variety of methods, every one who needs such a thing may please his own fancy in the choice. We have thought it unnecessary to add any more but one kind of these, fig. 14. which will answer the end effectually.

It is evident that houses situated near high hills, or thick woods, will be in some measure exposed to the same inconvenience; but it is likewise plain, that if a house be situated upon the slope of a hill, as at F, fig. 13. it will not be in any danger of smoke when the wind blows towards that side of the hill upon which it

Smoke.

is situated; for the current of air coming over the house-top in the direction GH, is immediately changed by the slope of the hill to the direction HC, which powerfully draws the smoke upward from the top of the chimney. But it is also evident, that a house in this situation will be liable to smoke when the wind blows from the hill; for the current of air coming downward in the direction CH, will beat downward on the chimney F, and prevent the smoke from ascending with freedom. But the effect will be much heightened if the doors and windows are chiefly in the lowermost side of the house.

These are some of the most general circumstances which prevent the free ascent of smoke, arising from external objects: but there are many other lesser causes which may at times occasion smoke, all of which it would be tedious here to enumerate; such as, blasts of air, reflected from the sides of mountains, and coming down valleys with great impetuosity, occasioning, in particular situations, eddies or whirlwinds of different sorts. In short, whatever in any measure disturbs the free motion of the air, is in danger of producing sudden gusts, which may occasion smoke. Therefore, whoever builds in a situation which is not altogether free, may lay his account with having some sudden gusts of smoke, unless he forms the top of his chimney so as to obviate it. And there are some situations so much exposed to sudden gusts of wind, sometimes whirling round, sometimes beat suddenly downward, or as suddenly carried up again, that it is difficult to guard against every danger. In these situations we would recommend something of the form of what is represented at fig. 15. which would be proof against every wind whatever.

Having thus traced the causes of smoky houses, and reduced them to distinct classes for the sake of distinctness; it is necessary, before we quit this subject, to observe, that in many cases, two or more of these may be combined to augment the malady, and therefore it is necessary to have all these circumstances in view in every particular case. It now only remains that we point out the several phenomena which may lead us to distinguish from which of these general causes the disorder complained of may proceed. And,

1st, If it is owing to a fault in the construction of the chimney itself, it will smoke almost continually, especially in calm weather.

2d, If it does not smoke in calm weather, or only when the wind comes from some particular quarter, and can then be cured by opening some door or window, the fault may be looked for in the distribution of the doors or windows of the house. The only case in which there is a difficulty to distinguish whether it is owing to the fault of the chimney or the house, is when it proceeds from too much closeness of the apartment. But this may be easily known by trying it in a calm: for if it proceeds from this cause, there will be no smoke in a perfect calm, if the doors are left open; whereas, if the defect proceeds from a fault in the chimney itself, it will still continue to smoke when calm, even when the doors are open.

3d, When the smoke is occasioned by external causes, there can be generally seen; but it may be likewise known by this, that it descends in sudden puffs with great violence at times, even when the doors and win-

dows are not altered. By attending to these few rules with care, there will be little danger of mistaking the cause from whence this disorder proceeds.

We shall conclude these observations with a few remarks on some particular cases, which can hardly be reduced to any of the foregoing heads. And,

1st, It sometimes happens that the smoke is prevented from ascending with freedom, by having a small part of the top of the chimney broke down, so as that some parts of it remain higher than others, which in some measure reduces it to the state of a chimney at the side of a higher one. To prevent this, it is always proper to have the top of the chimney finished with stones neatly cut, and firmly built. It is not to be doubted but that those things which are placed upon particular chimneys with a view to cure them of smoke, do often, from the same cause, hurt the neighbouring chimneys built in the same wall.

2d, A chamber is sometimes filled with smoke, when a fire is kindled in a neighbouring chimney, and none in it, although there is no appearance of smoke when it has a fire burning in its own grate. This may sometimes proceed from a small hole breaking through the thin partition that divides the two chimneys from one another; and as smoke is a weighty body, which is only buoyed up by the warm air which passes thro' the fire, when it penetrates into the cold chimney it naturally subsides, and comes down to the chamber with which the chimney communicates, when there is no fire to carry it off. But this disease is generally produced by the smoke entering at the top of the chimney, and descending downwards: if this last is the case, it may be cured, on many occasions, by setting a pretty high stone at the top of the chimney, as a division between each two: but the surest method, in all cases, is to have a smoke-board exactly fitted into the chimney above the grate, which on all occasions effectually prevents it.

3d, It frequently happens, that a chimney does not carry off the smoke well at first when the fire is kindled, although there is not the smallest tendency to it at other times. This proceeds from the narrowness of the chimney; for when the fire is kindled, the whole tube is filled with cold air, as weighty as that in the apartment; and being expanded by the fire at the bottom, it endeavours to ascend upward; but being pent in by the narrowness of the tube, and pressed by the column of cold air above it, it is some time before it can wholly overcome that resistance, and some of it is forced into the chamber, till by degrees the whole chimney is heated, and then it vents quite well. If the smoke produced by this means is not very troublesome, it may be borne with; but if it be extremely disagreeable, it may be cured by having a large sheet of milled iron, large enough to reach between the two sides of the fire-place, and as deep as to reach from the mantle to the grate, or lower, which might by any contrivance be hung up before the fire at that time to act in some measure as a *smoke-chimney*. This would quickly make the fire burn, and carry off the smoke entirely. After that is effected, it might then be removed till another occasion.

SMOKE-FARthings. The pentecostals, or customary oblations offered by the dispersed inhabitants within a diocese when they made their procession to the mother-

Smoke
||
Smollet.

Smollet.

cathedral church, came by degrees into a standing annual-rent, called *smoke-farthing*.

SMOKE-SILVER. Lands were holden in some places by the payment of the sum of 6d. yearly to the sheriff, called *smoke-silver*. Pat. 4. Edw. VI. Smoke-silver and smoke-penny are to be paid to the ministers of divers parishes as a *modus* in lieu of tithe-wood: and in some manors formerly belonging to religious houses, there is still paid as appendant to the said manors, the ancient Peter-pence, by the name of *smoke-money*. *Twiss's Hist. vindicat.* 77.—The bishop of London, anno 1444, issued out his commission, *Ad levandum le smoke-farthings*, &c.

SMOLENSKO, a large and strong town of Russia, and capital of a palatinate of the same name, with a castle, seated on a mountain, and a bishop's see. It is strong by its situation, being in the middle of a wood, and surrounded by almost inaccessible mountains. It has been taken and retaken several times by the Poles and Russians; but these last have had possession of it ever since the year 1687. It is seated on the river Nieper, near the frontiers of Lithuania, 188 miles south-west of Moscow. E. Long. 33. 15; N. Lat. 56. 10.

SMOLENSKO, a duchy and palatinate of Russia, bounded on the north by Biela, on the east by the duchy of Moscow, on the south by that of Severia and the palatinate of Meislaw, and on the west by the same palatinate and by that of Witepsk. It is full of forests and mountains; and the capital town is of the same name.

SMOLLET (Dr Tobias), was born in Scotland in the year 1720, and in the early part of his life served as a surgeon's mate in the navy. The incidents that befel him during his continuance in this capacity served as a foundation for one of the most entertaining novels in the English tongue, *The Adventures of Roderick Random*, 2 vols, 12mo; a book which still continues to have a most extensive sale, and first established the Doctor's reputation. All the first volume, and the beginning of the second, appears to consist of real incident and character, though certainly a good deal heightened and disguised. The Judge his grandfather, Crab and Potion the two apothecaries, and Squire Gawkey, were characters well known in that part of the kingdom where the scene was laid. Captains Oakham and Whiffle, Doctors Mackshane and Morgan, were also said to be real personages; but their names we have either never learnt, or have now forgotten. A bookbinder and barber long eagerly contended for being shadowed under the name of *Strap*. The Doctor seems to have enjoyed a peculiar felicity in describing sea-characters, particularly the officers and sailors of the navy. His Trunnion, Hatchway, and Pipes, are highly-finished originals; but what exceeds them all, and perhaps equals any character that has yet been painted by the happiest genius of ancient or modern times, is his Lieutenant Bowling. This is indeed nature itself; original, *unique*, and *sui generis*.

It is surprising that, notwithstanding Dr Smollet was so very successful in hitting off original characters in narration, he could never succeed in the drama. Very early in life, he wrote a tragedy intitled *The Regicide*, founded on the story of the assassination of James I. of Scotland; which, with all his interest and address, he never could get represented on the stage. He after-

wards published it by subscription; with what success we cannot now recollect: but we are much mistaken if he has not alluded to some of his own theatrical occurrences, in the story of *Melopoyne*, in *Roderick Random*.

By the publication of that work the Doctor had acquired so great a reputation, that henceforth a certain degree of success was insured to every thing known or suspected to proceed from his hand. In the course of a few years, *The Adventures of Peregrine Pickle* appeared; a work of great ingenuity and contrivance in the composition, and in which an uncommon degree of erudition is displayed, particularly in the description of the entertainment given by the Republican Doctor, after the manner of the ancients. Under this personage the late Dr Akenfield, author of a famous poem intitled *The Pleasures of Imagination*, is supposed to be typified; and it would be difficult to determine whether profound learning or genuine humour predominate most in this episode. Another episode of *The Adventures of a Lady of Quality*, likewise inserted in this work, contributed greatly to its success, and is indeed admirably well executed; the materials, it is said, the lady herself (the celebrated lady *Vane*) furnished.

These were not the only original compositions of this stamp with which the Doctor has favoured the public. Ferdinand Count Fathom and Sir Lancelot Greaves, are still in the list of what may be called *reading novels*, and have gone through several editions; but there is no injustice in placing them in a rank far below the former. No doubt invention, character, composition, and contrivance, are to be found in both; but then situations are described which are hardly possible, and characters are painted which, if not altogether unexampled, are at least incompatible with modern manners; and which ought not to be, as the scenes are laid in modern times.

The last work which we believe the Doctor published, was of much the same species, but cast into a different form—*The Expedition of Humphrey Clinker*. It consists of a series of letters, written by different persons to their respective correspondents. He has here carefully avoided the faults which may be justly charged to his two former productions. Here are no extravagant characters nor unnatural situations. On the contrary, an admirable knowledge of life and manners is displayed; and most useful lessons are given applicable to interesting, but to very common situations.

It appears from *Roderick Random*, that Mr Smollet was at the siege of Carthage; of which expedition he gives a faithful, though no very pleasing account. Soon after his return he must have taken his degree of Doctor of Physic, though we have not been able to learn at what time and at what place. It is said that, before he took a house at Chelsea, he attempted to settle as practitioner of physic at Bath; and with that view wrote a treatise on the waters—but was unsuccessful, chiefly because he could not render himself agreeable to the women, whose favour is certainly of great consequence to all candidates for eminence, whether in medicine or divinity. This, however, was a little extraordinary; for those who remembered Dr Smollet at that time, cannot but acknowledge that he was as graceful and handsome a man as

any

Smollet.

any of the age he lived in; besides, there was a certain dignity in his air and manner which could not but inspire respect wherever he appeared. Perhaps he was too soon discouraged; in all probability, had he persevered, a man of his great learning, profound sagacity, and intense application, besides being endued with every other external as well as internal accomplishment, must have at last succeeded, and, had he attained to common old age, been at the head of his profession.

Abandoning physic altogether as a profession, he fixed his residence at Chelsea, and turned his thoughts entirely to writing. Yet, as an author, he was not near so successful as his happy genius and acknowledged merit certainly deserved. He never acquired a patron among the great, who by his favour or beneficence relieved him from the necessity of writing for a subsistence. The truth is, Dr Smollet possessed a loftiness and elevation of sentiment and character which appears to have disqualified him for currying favour among those who were able to confer favours. It would be wrong to call this disposition of his pride or haughtiness; for to his equals and inferiors he was ever polite, friendly, and generous. Bookellers may therefore be said to have been his only patrons; and from them he had constant employment in translating, compiling, and reviewing. He translated *Gil Blas* and *Don Quixote*, both so happily, that all the former translations of these excellent productions of genius are in a fair way of being superseded by his. His name likewise appears to a translation of *Voltaire's Prose Works*; but little of it was done by his own hand; he only revised it, and added a few notes. He was concerned in a great variety of compilations. His *History of England* was the principal work of that kind. It had a most extensive sale; and the Doctor is said to have received 2000*l.* for writing it and the continuation.

In the year 1755 he set on foot the *Critical Review*, and continued the principal manager of it till he went abroad for the first time in the year 1763. To speak impartially, he was, perhaps, too acrimonious sometimes in the conduct of that work. Having, in particular, made some very severe strictures on a pamphlet published by Admiral Knowles, as well as on the writer's character, the latter commenced a prosecution against the printer, declaring, it was said, he only wanted to know the author, that, if a gentleman, he might obtain the satisfaction of a gentleman from him. In this affair the Doctor behaved with great spirit. Just as sentence was going to be pronounced against the printer, he came into court, avowed himself the author of the strictures in question, and declared himself ready to give the Admiral any satisfaction he chose. Upon this, the Admiral began a fresh action against the Doctor, who was found guilty, fined 100*l.* and condemned to three months imprisonment in the King's Bench. It is there he is said to have written the *Adventures of Sir Lancelot Greaves*; in which he has described some remarkable characters, then his fellow-prisoners.

When lord Bute was called to the chief administration of affairs, he was prevailed upon to write in defence of that nobleman's measures; which he did in a weekly paper, called the *Briton*. This gave rise to the famous North-Briton; wherein, according to the opinion of the public, he was rather baffled. The truth

Smollet, Smuggler

is, the Doctor did not seem to possess the talents necessary for political altercation. He wanted temper and coolness; and his friends accused his patron of having denied him the necessary information, and even neglected the fulfilling of some of his other engagements with him. Be that as it will, the Doctor is said not to have forgotten him in his subsequent performances.

His constitution being at last greatly impaired by a sedentary life and assiduous application to study, he went abroad for his health in the year 1763. He wrote an account of his travels in a *Series of Letters* to some friends, which were afterwards published in two volumes 8vo. During all that time he appears to have laboured under a constant fit of chagrin. But the state of his mind will be best learnt from himself. Thus he writes in his first letter: "In gratifying your curiosity, I shall find some amusement to beguile the tedious hours; which, without some such employment, would be rendered insupportable by dis temper and disquiet. You knew and pitied my situation, traduced by malice, persecuted by faction, abandoned by false patrons, and overwhelmed by the sense of a domestic calamity, which it was not in the power of fortune to repair." By this domestic calamity he means the loss of his only child, a daughter, whom he loved with the tenderest affection. The Doctor lived to return to his native country; but his health continuing to decline, and meeting with fresh mortifications and disappointments, he went back to Italy, where he died in October the 21st 1771, having been born in the year 1720. He was employed, during the last years of his life, in abridging the *Modern Universal History*, great part of which he had originally written himself, particularly the histories of France, Italy, and Germany.

It would be needless to expatiate on the character of a man so well known as Dr Smollet, who has, besides, given so many strictures of his own character and manner of living in his writings, particularly in *Hamphrey Clinker*; where he appears under the appellation of *Mr Serle*, and has an interview with Mr Bramble; and his manner of living is described in another letter, where young Melford is supposed to dine with him at his house in Chelsea. No doubt, he made a great deal of money by his connections with the bookellers; and had he been a rigid economist, or ended with the gift of retention, (an expression of his own), he might have lived and died very independent. However, to do justice to his memory, his difficulties, whatever they were, proceeded not from extravagance or want of economy. He was hospitable, but not ostentatiously so; and his table was plentiful, but not extravagant. No doubt he had his failings; but still it would be difficult to name a man who was so respectable for the qualities of his head, or more amiable for the virtues of his heart.

SMUGGLERS, in law, those persons who conceal or run prohibited goods, or goods that have not paid his majesty's customs.

SMUGGLING is restrained by a great variety of statutes, which inflict pecuniary penalties and seizure of the goods for clandestine smuggling; and affix the guilt of felony, with transportation for seven years, upon more open, daring, and avowed practices: but the last of them, 19 Geo. II. c. 34. is for this purpose *infamum*; for it makes all forcible acts of smuggling

Smut,
Smyrna.

smuggling, carried on in defiance of the laws, or even in disguise to evade them, felony without benefit of clergy: enacting, that if three or more persons shall assemble, with fire-arms or other offensive weapons, to assist in the illegal exportation or importation of goods, or in refusing the same after seizure, or in refusing offenders in custody for such offences; or shall pass with such goods in disguise; or shall wound, shoot at, or assault any officers of the revenue when in the execution of their duty; such persons shall be felons, without the benefit of clergy. As to that branch of the statute which required any person, charged upon oath as a smuggler, under pain of death, to surrender himself upon proclamation, it seems to be expired; as the subsequent statutes, which continue the original act to the present time, do in terms continue only so much of the said act as relates to the punishment of the offenders, and not to the extraordinary method of apprehending or causing them to surrender: and for offences of this positive species, where punishment (though necessary) is rendered so by the laws themselves, which, by imposing high duties on commodities, increase the temptation to evade them, we cannot surely be too cautious in inflicting the penalty of death.

SMUT, in husbandry, a disease in corn, when the grains, instead of being filled with flour, are full of a stinking black powder.

As to the cause of this distemperature, some have attributed it to excessive rankness, or fatness of the soil; to the manuring the land with rotten vegetables; and to the sowing smutty seed. Mr Bradley thinks it is owing to the same cause with a blight, *viz.* to multitudes of insects. But Mr Tull is convinced from experiment, that it is caused by too much moisture; for planting several plants of corn in troughs of very moist earth, they all produced smutty ears, while very few were found in the field from whence these plants were taken.

There are two remedies for the smut, recommended by writers on husbandry, *viz.* steeping the seed in salt brine, and changing the seed.

As to the steeping of seed, when wheat is intended for drilling, it must be soaked in a brine of pure salt, dissolved in water, since urine is found to be highly prejudicial. The most expeditious way of bringing wheat for drilling, is to lay it in a heap, and wash it with a strong brine sprinkled on it, stirring it up with a shovel, that it may be all equally brined, or wetted with it; after this, sift on some fine lime all over the surface, and stir it up, still sifting on more in the same manner till the whole is dusted with lime, it will then be soon dry enough to be drilled without further trouble. It must be quicklime in its full strength that is used on this occasion.

The bread made of smutty corn is very pernicious, acting as a narcotic, and occasioning not only sleepiness, but vertiges, and even convulsions.

SMYRNA, a sea-port town of Turkey in Asia, and one of the largest and richest cities of the Levant. The goodness of the harbour has caused it to be rebuilt several times, after being destroyed by earthquakes. It is the rendezvous of merchants from almost all parts of the world, and the magazines of their merchandizes. Some time ago it was thought to contain 15,000 Turks, 10,000 Greeks, 1800 Jews, 200

Vol. X.

Armenians, and 200 Franks. The Turks have 19 mosques, the Greeks 2 churches, the Jews 8 synagogues, the Armenians 1 church, and the Latins 3 convents. There are three bishops; one Greek, another Latin, and the third Armenian. The streets are more open, better paved, and the houses better built, than in other towns of the continent. The street of the Franks is the finest in Smyrna, and lies all along the harbour. It is 8 days journey from Constantinople by land, 25 days from Aleppo by the caravans, 6 from Cognac, 7 from Cataya, and 6 from Satalia. The caravans of Persia often bring 2000 bales of silk in a year, besides drugs and cloths. The other commodities brought here, are thread made of goats hair, cotton yarn, cotton in bags, nut galls, wax, scammony, rhubarb, opium, aloes, tully, galbanum, gum-arabic, gum-tragacanth, gum-ammoniac, frankincense, zedoary, and all sorts of carpets. All the trade passes through the hands of the Jews, and they seem to have better capacities for trade than other merchants. The English and Dutch factories have Protestant chapels, and taverns are as open here as in Europe. The fortifications consist in a fort, a castle, a mountain, and an old citadel. In the year 1778, it was almost totally destroyed by an earthquake and fire.

SNAPPLE, in the manege, is a very slender bit-mouth without any branches, much used in England; the true bridle being reserved for war.

SNAIL, in zoology. See *HELIX* and *LIMAX*.

SNAKE, in zoology. See *ANGUIS*.

Method of Preserving SNAKES. When the snake is killed, it must first be washed clean, and freed from all filth and nastiness; then it is to be put into a glass of a proper size, the tail first, and afterwards the rest of the body, winding it in spiral ascending circles, and disposing the back, which is always the most beautiful, outwardly. A thread, connected to a small glass bead, is, by the help of a needle, to be passed thro' the upper jaw from within outwardly, and then thro' the cork of the bottle, where it must be fastened; by this means the head will be drawn into a natural posture, and the mouth kept open by the bead, whereby the teeth, &c. will be discovered: the glass is then to be filled with rum, and the cork sealed down to prevent its exhalation. A label, containing the name and properties of the snake, is then to be affixed to the wax over the cork; and in this manner the snake will make a beautiful appearance, and may be thus preserved a great number of years; nor will the spirits impair or change the lustre of its colours.

SNAKE-Root, in botany. See *POLYGALA*.

SNAKE-Weed, in botany. See *POLYGONUM*.

SNAPEDRAGON, in botany. See *ANTIRRHINUM*.

SNEEZING, a convulsive motion of the muscles of the breast, whereby the air is expelled from the nose with much vehemence and noise. It is caused by the irritation of the upper membrane of the nose, occasioned by acrid substances floating in the air, or by medicines called *sternutatory*. See *MEDICINE*, n° 220.

SNIGGLING, a method of fishing for eels, chiefly used in the day-time, when they are found to abound themselves near weirs, mills, or flood-gates. It is performed thus: Take a strong line and hook, baited with a garden-worm, and observing the holes

Smyrna
Snigglng.

Snipe
||
Snow.

Snow.

where the eels lie hid, thrust your bait into them by help of a stick; and if there be any, you shall be sure to have a bite; and may, if your tackling hold, get the largest of eels.

SNUIPE, in ornithology. See SCOLOPAX and SHOOTING.

These birds are easily taken, by means of lime-twigs, in this manner. Take 50 or 60 birchen-twigs, and lime them all very well together; take these out into places where there are snipes, and having found the places which they most frequent, which may be seen by their dung, set the twigs in these places, at about a yard distance one from another. Other places, are those where the water lies open in hard frosty and snowy weather: in these places also, and where-ever they are suspected to come to feed, let more lime-twigs be placed in the same manner. The twigs are not to be placed perpendicularly in the ground, but sloping, some one way, some another; the sportsman is then to retire to a distance, and watch the coming of the birds to these places. When they fly to them, they naturally take a sweep round the earth, and by this means they will almost always be caught by one or other of the twigs. When a first snipe is taken, the sportsman is not to run to take it up, for it will feed with the twig under its wings, and this will be a means of bringing down more of them to the place. When three or four are taken, they may be taken up, only leaving one fast to entice others: and thus the sport may be continued, as long as there are any birds of this kind about the place. It may be very proper, when the twigs are planted, to go about, and beat all the open and watery places near, that they may be raised from thence, and fly to those places where the twigs are placed to receive them.

SNORING, in medicine, otherwise called *rhencor* or *stertor*, is a sound like that of the cerchnon, but greater and more manifest. A *stertor* is that sound which is supposed to be made betwixt the palate and nostrils, by persons asleep; *cerchnon*, or *cerchnon*, is that bubbling noise which is made in respiration, from the larynx, or the aspera arteria. These affections are owing to a weakness of nature.

SNOW, a well-known meteor, formed by the freezing of the vapours in the atmosphere. It differs from hail and hoar-frost in being as it were crystallized, which they are not. This appears on examination of a flake of snow by a magnifying glass; when the whole of it will appear to be composed of fine shining spicula diverging like rays from a centre. As the flakes fall down through the atmosphere, they are continually joined by more of these radiated spicula, and thus increase in bulk like the drops of rain or hailstones. Dr Grew, in a discourse of the nature of snow, observes, that many parts thereof are of a regular figure, for the most part so many little sowels or stars of six points, and are as perfect and transparent ice as any we see on a pond, &c. Upon each of these points are other collateral points, set at the same angles as the main points themselves: among which there are divers other irregular, which are chiefly broken points, and fragments of the regular ones. Others also, by various winds, seem to have been thawed, and froze again into irregular clusters; so that it seems as if the whole body of snow were an infinite

mass of icicles irregularly figured. That is, a cloud of vapours being gathered into drops, the said drops forthwith descend; upon which descent, meeting with a freezing air as they pass through a colder region, each drop is immediately frozen into an icicle, shooting itself forth into several points; but these still continuing their descent, and meeting with some intermitting gales of warmer air, or in their continual wastage to and fro touching upon each other, some of them are a little thawed, blunted, and again froze into clusters, or intangled so as to fall down in what we call *flakes*.

The lightness of snow, although it is firm ice, is owing to the excess of its surface, in comparison to the matter contained under it; as gold itself may be extended in surface, till it will ride upon the least breath of air.

According to Signior Beccaria, clouds of snow differ in nothing from clouds of rain, but in the circumstance of cold that freezes them. Both the regular diffusion of the snow, and the regularity of the structure of its parts (particularly some figures of snow or hail which fall about Turin, and which he calls *rosette*) show that clouds of snow are acted upon by some uniform cause like electricity; and he endeavours to show how electricity is capable of forming these figures. He was confirmed in his conjectures by observing, that his apparatus for observing the electricity of the atmosphere never failed to be electrified by snow as well as rain. Professor Winthrop sometimes found his apparatus electrified by snow when driven about by the wind though it had not been affected by it when the snow itself was falling. A more intense electricity, according to Beccaria, unites the particles of hail more closely than the more moderate electricity does those of snow, in the same manner as we see that the drops of rain which fall from thunder-clouds are larger than those which fall from others, though the former descend through a less space.

In the northern countries, the ground is covered with snow for several months; which proves exceedingly favourable for vegetation, by preserving the plants from those intense frosts which are common in such countries, and which would certainly destroy them. Bartholin ascribes great virtues to snow-water, but experience does not seem to warrant his assertions. Snow or ice-water is always deprived of its fixed air; and those nations who live among the Alps, and use it for their constant drink, are subject to affections of the throat, which are thought to be occasioned by it.

From some late experiments on the quantity of water yielded by snow, it appears that the latter gives only about one-tenth of its bulk.

Snow, in sea-affairs, is generally the largest of all two-masted vessels employed by Europeans, and the most convenient for navigation.

The sails and rigging on the main-mast and fore-mast of a snow are exactly similar to those on the same masts in a ship; only that there is a small mast behind the main-mast of the former, which carries a sail nearly resembling the mizen of a ship. The foot of this mast is fixed on a block of wood on the quarter-deck abaft the main-mast; and the head of it is attached to the after-top of the main-top. The sail which is called the *try-sail* is extended from its mast towards the stern of the vessel.

When

When the floops of war are rigged as snows, they are furnished with a horle, which answers the purpose of the try-fail mast, the fore-part of the sail being attached by rings to the said horle, in different places of its height.

SNOWDON-HILL, the name of a mountain in Caernarvonshire in Wales, generally thought to be the highest in Britain; though some have been of opinion that its height is equalled, or even exceeded, by mountains in the Highlands of Scotland. The mountain is surrounded by many others, called in the Welsh language *Crib Coch*, *Crib y Dyffill*, *Lliwedd y'r Aran*, &c.

* Journey to Snowdon.

According to Mr Pennant *, this mountainous tract yields scarcely any corn. Its produce is cattle and sheep; which, during summer, keep very high in the mountains, followed by their owners with their families, who reside during that season in *havodys*, or "summer dach-houses," as the farmers in the Swiss Alps do in their *fermes*. These houses consist of a long low room, with a hole at one end to let out the smoke from the fire which is made beneath. Their furniture is very simple; stones are substituted for stools, and their beds are of hay, ranged along the sides. They manufacture their own cloaths, and dye them with the *lichen omphaloides* and *lichen parietinus*, mosses collected from the rocks. During summer the men pass their time in tending their herds, or in making hay, &c. and the women in milking, or making butter and cheese. For their own use they milk both ewes and goats, and make cheese of the milk. Their diet consists of milk, cheese, and butter; and their ordinary drink is whey, though they have, by way of reserve, a few bottles of very strong beer, which they use as a cordial when sick. They are people of good understanding, wary, and circumspect; tall, thin, and of strong constitutions. In the winter-time they descend into the *ben dref*, or "old dwelling," where they pass their time in inactivity.

The view from the highest peak of Snowdon is very extensive. From hence Mr Pennant saw the county of Chester, the high hills of Yorkshire, part of the north of England, Scotland, and Ireland; a plain view of the isle of Man; and that of Anglesea appeared like a map extended under his feet, with every rivulet visible. Our author took much pains to have this view to advantage; sat up at a farm on the west till about 12, and walked up the whole way. The night was remarkably fine and starry; towards morning the stars faded away, leaving an interval of darkness, which, however, was soon dispelled by the dawn of day. The body of the sun appeared most distinct, with the roundness of the moon, before it appeared too brilliant to be looked at. The sea, which bounded the western part of the prospect, appeared gilt with the sun-beams, first in slender streaks, and at length glowed with redness. The prospect was disclosed like the gradual drawing up of a curtain in a theatre; till at last the heat became sufficiently strong to raise mists from the various lakes, which in a slight degree obscured the prospect. The shadow of the mountain extended many miles, and showed its bicapitated form; the Wyddfa making one head, and Crib y Dyffill the other. At this time he counted between 20 and 30 lakes either in Caernarvon, or in Merionethshire. In making another visit, the sky was obscured very

soon after he got up. A vast mist involved the whole circuit of the mountain, and the prospect down was horrible. It gave an idea of numbers of abysses, concealed by a thick smoke furiously circulating around them. Very often a gulf of wind made an opening in the clouds, which gave a fine and distinct view of lake and valley. Sometimes they opened in one place, at others in many at once; exhibiting a most strange and perplexing sight of water, fields, rocks, and chasms. They then closed again, and every thing was involved in darkness; in a few minutes they would separate again, and repeat the above-mentioned scene with infinite variety. From this prospect our traveller descended with great reluctance; but before he had reached the place where his horses were left, he was overtaken by a thunder-storm. The rolling of the thunder-claps, being reiterated by the mountains, was inexplicably awful; and after he had mounted, he was in great danger of being swept away by the torrents which poured down in consequence of a very heavy rain.

It is very rare (Mr Pennant observes), that the traveller gets a proper day to ascend the hill: for it very often appears clear; but by the evident attraction of the clouds by this lofty mountain, it becomes suddenly and unexpectedly enveloped in mist, when the clouds have just before appeared very high and very remote. At times he observed them lower to half their height; and notwithstanding they have been dispersed to the right and left, yet they have met from both sides, and united to involve the summit in one great obscurity.

The height of Snowdon was measured, in 1682, by one Mr Calwell, with instruments made by Flamsteed: according to his mensuration, the height is 3720 feet; but more modern computations make it only 3568, reckoning from the quay at Caernarvon to the highest peak. The stone that composes this mountain is excessively hard. Large coarse crystals, and frequently cubic pyrites are found in the fissures. An immense quantity of water rushes down the sides of Snowdon and the neighbouring mountains, inasmuch that Mr Pennant supposes, if collected into one stream, they would exceed the waters of the Thames.

SNOW-Drop, in botany. See CHIONANTHUS.

SNUFF, a powder chiefly made of tobacco, the use of which is too well known to need any description here.

The many mischiefs attending the practice of taking this powder of tobacco at the nostrils, have been described by the writers in general on these subjects, since this pernicious custom has reigned in the world; but one of the most remarkable accidents occasioned by it, is related in the *Alta Eruditorum*.

The case is this. A fat person, greatly addicted to the taking Spanish snuff, after many years continued use of it, complained one day of a mighty uneasiness which it occasioned in the middle of his oesophagus, and soon after this he began to find his swallowing difficult. He applied for relief to a physician; and naming nothing of the pain which had preceded this difficulty of swallowing, it was treated as a complaint arising from some glutinous humour in the oesophagus. It is no wonder that the medicines in this intention had no effect. The patient grew worse; and, tired of this doctor, applied to another, who, supposing the complaint arose from some sharp humour vellicating the

parts, gave medicines in that intention, equally without success. After this a common quack tried the most violent medicines on him, but without success. Finally, he applied to the use of the *excusula ventriculi*, an instrument made to be thrust down the œsophagus into the stomach: but this he could never get down; and in the use of this instrument he first felt that there was absolutely a lump of flesh, which stopped its passage farther than the place where the seat of his complaint was. The distemper after this increased upon him, till he could only swallow liquids, and those at last by no other means but by sucking them thro' a quill, by which means he could get down milk, water-gruel, and the like, by a little at a time. At length consulting another physician, and telling him of the immoderate quantity of Spanish snuff he had been used to take, and that it often happened to him on taking the driest snuff of this kind, that it got into his œsophagus, and occasioned violent pain, coughing, and spitting of blood, he soon concluded that a polypus had formed itself in the œsophagus, wounded by this sharp powder; and that there was no relief, but that the death of the patient was quickly approaching. The man, from a very corpulent habit, was so extenuated, that he appeared a mere skeleton; he died some little time after of absolute hunger, the œsophagus being so entirely filled up by this unnatural swelling, that not the least drop of a liquid could get down.

After death the œsophagus was opened, and a fleshy excrescence, or polypus, was discovered, of the bigness of the cavity of the part; and, taking its origin about the middle, from the back-part of the œsophagus, it reached down to the pylorus. This was of a whitish colour, and much resembled a large worm; and its substance was fibrous, and very tender.

SNYDERS (Francis), a Flemish painter, born at Antwerp in 1579, and bred under his countryman Henry Van Balen. His genius first displayed itself in painting fruit: he afterwards attempted animals, hunting, fish, &c. in which he exceeded all his predecessors. He also painted kitchens, &c. and gave dignity to subjects that seemed incapable of it. He was made painter to Ferdinand and Isabella, archduke and duchess, and became attached to the house of the cardinal infant of Spain. The king of Spain and the elector Palatine adorned their palaces with huntings by this artist. Rubens, Jordaens, and Snyders, used to co-operate in the enriching of each other's pictures according to their several talents; and thus they became more valuable than if finished by either of them singly. Snyders died in 1657.

SOAL-FISH, in ichthyology. See PLEURONECTES.

SOAP, a composition of caustic, fixed alkaline salt, and oil, sometimes hard and dry, sometimes soft and liquid; much used in washing, whitening linens, and by dyers and fullers.—Soap may be made by several methods, which, however, all depend upon the same principle. The soap which is used in medicine is made without heat; see CHEMISTRY, n° 326.

In manufactures where large quantities of it are prepared, soap is made with heat. A lixivium of quicklime and soda is made, but is less concentrated than that above referred to, and only so much that it can sustain a fresh egg. A part of this lixivium is to be even di-

luted, and mixed with an equal weight of oil of olives. The mixture is to be put on a gentle fire, and agitated, that the union may be accelerated. When the mixture begins to unite well, the rest of the lixivium is to be added to it; and the whole is to be digested with a very gentle heat, till the soap be completely made. A trial is to be made of it, to examine whether the just proportion of oil and alkali has been observed. Good soap of this kind ought to be firm, and very white when cold; not subject to become moist by exposure to air, and entirely miscible with pure water, to which it communicates a milky appearance, but without any drops of oil floating on the surface. When the soap has not these qualities, the combination has not been well made, or the quantity of salt or of oil is too great, which faults must be corrected.

In soft or liquid soaps, green or black soaps, cheaper oils are employed, as oil of nuts, of hemp, of fish, &c. These soaps, excepting in consistence, are not essentially different from white soap.

Any fixed alkalis are much disposed to unite with oils that are not volatile, both vegetable and animal, since this union can be made even without heat. The compound resulting from this union partakes at the same time of the properties of oil and of alkali; but these properties are modified and tempered by each other, according to the general rule of combinations. Alkali formed into soap has not nearly the same acrimony as when it is pure; it is even deprived of almost all its causticity, and its other saline alkaline properties are almost entirely abolished. The same oil contained in soap is less combustible than when pure, from its union with the alkali, which is an unflammable body. It is miscible, or even soluble, in water, to a certain degree, by means of the alkali. Soap is entirely soluble in spirit of wine; and still better in aqua-vite sharpened by a little alkaline salt, according to an observation of Mr Geoffroy.

When oil unites with alkali in the formation of soap, it is little altered in the connection of its principles; for it may be separated from the alkali by decomposing soap with any acid, and may be obtained nearly in its original state.

Concerning the decomposition of soap by means of acids, we must observe, first, that all acids, even the weakest vegetable acids, may occasion this decomposition, because every one of them has a greater affinity than oil with fixed alkali. Secondly, these acids, even when united with any basis, excepting a fixed alkali, or the inflammable principle, are capable of occasioning the same decomposition; whence all ammoniacal salts, all salts with basis of earth, and all those with metallic bases, are capable of decomposing soap, in the same manner as disengaged acids are; with this difference, that the oil separated from the fixed alkali, by the acid of these salts, may unite more or less intimately with the substance which was the basis of the neutral salt employed for the decomposition.

Soap may also be decomposed by distillation, as Lemery has done. When first exposed to fire, it yields a phlegm called by him a *spirit*; which nevertheless is neither acid nor alkaline, but some water which enters into the composition of soap. It becomes more and more coloured and empyreumatic as the fire is increased, which shows that it contains the most subtle part

Soap.

of the oil. It seems even to raise along with it, by help of the oil and action of the fire, a small part of the alkali of the soap: for, as the same chemist observes, it occasions a precipitate in a solution of corrosive sublimate. After this phlegm, the oil rises altered, precisely as if it had been distilled from quicklime, that is, empyreumatic, soluble in spirit of wine, at first sufficiently subtle and afterwards thicker. An alkaline residuous coal remains in the retort, consisting chiefly of the mineral alkali contained in the soap, and which may be disengaged from the coal by calcination in an open fire, and obtained in its pure state.

Alkaline soaps are very useful in many arts and trades, and also in chemistry and medicine. Their principal utility consists in a deterfing quality that they receive from their alkali, which, although it is in some measure saturated with oil, is yet capable of acting upon oily matters, and of rendering them saponaceous and miscible with water. Hence soap is very useful to cleanse any substances from all fat matters with which they happen to be soiled. Soap is therefore daily used for the washing and whitening of linen, for the cleansing of woollen-cloths from oil, and for whitening silk and freeing it from the resinous varnish with which it is naturally covered. Pure alkaline lixiviums, being capable of dissolving oils more effectually than soap, might be employed for the same purposes; but when this activity is not mitigated by oil, as it is in soap, they are capable of altering, and even of destroying entirely by their causticity, most substances, especially animal-matters, as silk, wool, and others: whereas soap cleanses from oil almost as effectually as pure alkali, without danger of altering or destroying; which renders it very useful.

Soap furnishes medicine with a very efficacious and valuable remedy. Till lately, that Mrs Stephens's lithontriptic remedy has been published, physicians attended little to the medicinal qualities of soap. They soon found that soap, which is the principal ingredient of this famous remedy, is also the only one which has any real efficacy. And although this remedy has been found to be insufficient to dissolve most stones of the bladder, yet experience and observation have sufficiently evinced that it can prevent the enlargement, or even the formation, of stones in persons disposed to that disease; that it can, in a word, attenuate, divide, and expel, the stony particles generated in the urinary passages, and which are the first materials of the stone. And accordingly soap is frequently used successfully in these cases. When soap was once discovered to act sensibly on the glue or binding substance of that urinary sand, gravel, and even of some stones, it was naturally supposed to be capable of acting more powerfully on other thickened matters, which are too frequent causes of many obstinate diseases. These considerations have induced the best practitioners to prescribe soap as a resolving, aperitive, and deobstruent remedy; and we are certain that it has been employed as such with great success.

From the properties of soap we may know that it must be a very effectual and convenient anti-acid. It absorbs acids as powerfully as pure alkalis and absorbent earths, without having the causticity of the former, and without oppressing the stomach by its weight like the latter.

Lastly, we may perceive that soap must be one of the best of all antidotes to stop quickly, and with the least inconvenience, the bad effects of acid corrosive poisons, as aqua-fortis, corrosive sublimate, &c.

SOAP (*Starkey's*.) See CHEMISTRY, n° 327.

Acid Soap. This is formed by the addition of concentrated acids to the expressed oils. Thus the oil is rendered partially soluble in water; but the union is not sufficiently complete to answer any valuable purpose.

SOAP-EARTH. See STRATITES.

SOAPWORT. See SAPONARIA.

SOC. (Sax.) signifies power or liberty to minister justice or execute laws: also the circuit or territory wherein such power is exercised. Whence our law-Latin word *soca* is used for a feignory or lordship enfranchised by the king, with the liberty of holding or keeping a court of his *sockmen*: And this kind of liberty continues in divers parts of England to this day, and is known by the names of *ske* and *soke*.

SOCAGE, in its most general and extensive signification, seems to denote a tenure by any certain and determinate service. And in this sense it is by our ancient writers constantly put in opposition to chivalry, or knight-service, where the render was precarious and uncertain. The service must therefore be certain, in order to denominate it socage; as to hold by fealty and 20s. rent; or, by homage, fealty, and 20s. rent; or, by homage and fealty without rent; or, by fealty and certain corporal service, as ploughing the lord's land for three days; or by fealty only without any other service: for all these are tenures in socage.

Socage is of two sorts: free-socage, where the services are not only certain, but honourable; and villen-socage, where the services, though certain, are of a base nature. See VILLENAGE. Such as hold by the former tenure are called, in Glanvil and other subsequent authors, by the name of *liberi sokemanni*, or tenants in free-socage. The word is derived from the Saxon appellation *soc*, which signifies liberty or privilege; and, being joined to a usual termination, is called *socage*, in Latin *socagium*; signifying thereby a free or privileged tenure.

It seems probable that the socage-tenures were the relics of Saxon liberty; retained by such persons as had neither forfeited them to the king, nor been obliged to exchange their tenure for the more honourable, as it was called, but at the same time more burdensome, tenure of knight-service. This is peculiarly remarkable in the tenure which prevails in Kent, called *gavelkind*, which is generally acknowledged to be a species of socage-tenure; the preservation whereof inviolate from the innovations of the Norman conqueror is a fact universally known. And those who thus preserved their liberties were said to hold in free and common socage.

As therefore the grand criterion and distinguishing mark of this species of tenure are the having its renders or services ascertained, it will include under it all other methods of holding free lands by certain and invariable rents and duties; and in particular, *Petit Serjeanty*, Tenure in *BURGAGE*, and *GAVELKIND*. See these articles.

SOCIETY, in general, denotes a number of persons united together for their mutual assistance, security,

Soap

Society.

Society. rity, interest, or entertainment.

The social principle in man is of such an expansive nature, that it cannot be confined within the circuit of a family, of friends, of a neighbourhood: it spreads into wider systems, and draws men into larger communities and commonwealths; since it is in these only that the more sublime powers of our nature attain the highest improvement and perfection of which they are capable.

Royal Society, an academy or college, established by charter by king Charles II. for promoting natural knowledge and useful arts by experiments.

It consists of several hundred fellows or members, mostly British; some persons of the highest rank, and many eminent gentlemen and learned men of other nations. Their meetings are held once a-week, at their house in Crane-court, Fleet-Street, London; where they discourse upon the productions and rarities of nature and art, and consider how the same may be improved for the good of mankind: here are also read letters and other philosophical papers sent by ingenious persons both at home and abroad; upon which they discourse in the plainest manner, without affecting studied speeches.

This society, of which his Britannic majesty is perpetual patron, is governed by a council of twenty-one members, ten of whom are yearly chosen out of the society, on St Andrew's day. The chief of the council bears the title of President, whose proper office is to call and dissolve the meetings; to propose the matter to be debated; call for experiments; and admit such members as shall be elected, which must be by a majority of at least twenty-one votes; whereupon he is admitted, after paying 40s. and subscribing that he will endeavour to promote the good of the Royal Society of London by the improvement of natural knowledge; and being thus admitted, he afterwards pays 23s. a-quarter, as long as he continues a member of the society.

Society-Islands, the name of certain islands discovered in the South Sea. They had this general name from Captain Cook in 1769. They are six in number, and lie very near to each other. The particular names which they bear among the natives are, *Ulietea* or *Raietea*, *Otaha*, *Balabola*, *Huahine*, *Tubai*, and *Mau-rua*. They are situated between the longitude of 15° 57', and 152° west; and from latitude 16° 10' to 16° 55' south, the nearest island being about 40 leagues to the westward of Otaheitee.

"Here," says Captain Cook, "benevolent nature has spread her luxuriant sweets with a lavish hand; and the natives, copying the bounty of nature, are equally liberal, contributing plentifully and cheerfully to the wants of navigators." And Mr Forster describes the inhabitants of these fruitful regions, as ready at all times to perform kind offices to their esteemed guests; they would carry them in and out of the boats on their backs, to prevent the surf from wetting their feet; they often loaded themselves with the curiosities which had been purchased, and rarely refused to go into the water for any bird which had been shot. If the rain caught any of the ship's company on their excursions into the country, or the heat of the sun and fatigue of the journey oppressed them, they were invited to repose in their dwellings, and seated on their best

provisions. Their friendly host stood at a distance, and never talked of any thing till they intreated him; all the while some one of the family was employed in fanning them with a leaf or the bough of a tree. Before they left the house, they were commonly adopted according to their different ages, in the quality of father, brother, or son: which circumstance took its rise from an opinion that all the gentlemen of the ship were related. The chiefs of all the Society-Islands are descended from the same family; the officers therefore, and all who dined or messed together, were by them considered as relations. Their hospitality was frequently quite disinterested, and led their visitors to form the most favourable conclusions concerning their conduct towards each other." In short, says Mr Forster, "they are hospitable without seeming to know it, and leave to strangers who visit them the pleasing and grateful talk of recording their virtues."

SOCINIANS, in church-history, a sect of Christian heretics, so called from their founder Faustus Socinus. See **SOCINUS**.—They maintain, "That Jesus Christ was a mere man, who had no existence before the Virgin Mary; that the Holy Ghost is no distinct person, but that the Father is truly and properly God. They own that the name of God is given in the holy scriptures to Jesus Christ; but contend, that it is only a deputed title, which, however, invests him with an absolute sovereignty over all created beings, and renders him an object of worship to men and angels. They deny the doctrines of satisfaction and imputed righteousness; and only say that Christ preached the truth to mankind, set before them in himself an example of heroic virtue, and sealed his doctrines with his blood. Original sin and absolute predestination they esteem scholastic chimeras. They likewise maintain the sleep of the soul, which they say becomes insensible at death, and is raised again with the body at the resurrection, when the good will be established in the possession of eternal felicity, while the wicked will be consigned to a fire that will not torment them eternally, but consume both their souls and bodies for a certain duration proportioned to their demerits."

SOCINUS (Lælius), the first author of the sect of the Socinians, was born at Sienna, in 1525. Being designed by his father for the law, he began very early to search for the foundation of that science in the Word of God; and, by that study, discovered that the Romish religion taught many things contrary to revelation; when, being desirous of penetrating farther into the true sense of the scriptures, he studied Greek, Hebrew, and even Arabic. In 1547, he left Italy, to go and converse with the Protestants; and spent four years in travelling into France, England, the Netherlands, Germany, and Poland, and at length settled at Zurich. He, by this means, became acquainted with the most learned men of his time, who testified, by their letters, the esteem they had for him: but as he discovered to them his doubts, he was greatly suspected of heresy. He, however, conducted himself with such address, that he lived among the capital enemies of his opinions, without receiving the least injury. He met with some disciples, who heard his instructions with respect; these were Italians who left their native country on account of religion, and wandered about in Germany and Poland. He commu-

nicated

Socinus
Socinians.

nicated likewise his sentiments to his relations by his writings, which he caused to be conveyed to them at Sienna. He died at Zurich in 1562. Those who were of the opposite sentiments to his, and were personally acquainted with him, confess that his outward behaviour was blameless. He wrote a Paraphrase on the first Chapter of St John; and other works are ascribed to him.

SOCINUS (Faustus), nephew of the preceding, and principal founder of the Socinian sect, was born at Sienna in 1539. The letters which his uncle Lælius wrote to his relations, and which infused into them many seeds of heresy, made an impression upon him; so that, knowing himself not innocent, he fled as well as the rest when the inquisition began to persecute that family. He was at Lyon's when he heard of his uncle's death, and departed immediately to take possession of his writings. He returned to Italy; and made himself so agreeable to the grand duke, that the charms which he found in that court, and the honourable posts he filled there, hindered him for twelve years from remembering that he had been considered as the person who was to put the last hand to the system of samofatenian divinity, of which his uncle Lælius had made a rough draught. At last he went into Germany in 1574, and paid no regard to the grand duke's advices to return. He staid three years at Basil, and studied divinity there; and having fallen into a set of principles very different from the system of Protestants, he resolved to maintain and propagate them; for which purpose he wrote a treatise *De Jesu Christo Servatore*. In 1579, Socinus retired into Poland, and desired to be admitted into the communion of the Unitarians; but as he differed from them in some points, and refused to be silent upon them, he met with a repulse. However, he did not cease to write in defence of their churches against those who attacked them. At length his book against James Paleologus furnished his enemies with a pretence to exasperate the king of Poland against him; but though the mere reading of it was sufficient to refute his accusers, Socinus thought proper to leave Cracow, after having resided there four years. He then lived under the protection of several Polish lords, and married a lady of a good family: but her death, which happened in 1587, so deeply afflicted him as to injure his health; and to complete his sorrow, he was deprived of his patrimony by the death of Francis de Medicis great duke of Florence. The consolation he found in seeing his sentiments at last approved by several ministers, was greatly interrupted in 1598; for he met with a thousand insults at Cracow, and was with great difficulty saved from the hands of the rabble. His house was plundered, and he lost his goods; but this loss was not so uneasy to him as that of some manuscripts, which he extremely regretted. To deliver himself from such dangers, he retired to a village about nine miles distant from Cracow, where he spent the remainder of his days at the house of Abraham Blonski, a Polish gentleman, and died there in 1604. All Faustus Socinus's works are contained in the two first volumes of the *Bibliotheca Fratrum Polonorum*.

SOCMANS, SOKEMANS, or Socmen, (Socmanni), are such tenants as hold their lands and tenements by fage-tenure. See SOCAGE.

Socrates.

SOCOTORA, an island lying between Asia and Arabia Felix; about 150 miles in length, and 22 in breadth. It is particularly noted for its fine aloes, known by the name of *Socotrine aloes*. The religion of the natives is a mixture of Mahometanism and Paganism; but they are civil to strangers who call there in their passage to the East Indies. It abounds in fruit and cattle; and they have a king of their own, who is dependent on Arabia.

SOCRATES, the greatest of the ancient philosophers, "the very founder of philosophy itself," as the earl of Shaftesbury calls him, was born at Alopece, a small village of Attica, in the fourth year of the 77th olympiad, or about 467 years before Christ. His parents were very mean; Sophroniscus his father being a statuary or carver of images in stone, and Phœnareta his mother a midwife. However, he is observed to have been so far from being ashamed of his parents, that he often took occasion to mention them. Plutarch says, that as soon as he was born, Sophroniscus his father, consulting the oracle, was advised to suffer his son to do what he pleased, neither compelling him to what he disliked, nor diverting him from what he was inclined to; in short, to be nowise solicitous about him, since he had one guide of life within him, meaning his Genius, who was better than 500 masters. But Sophroniscus, regardless of the oracle's direction, put him to his own trade of carving statues; which, though contrary to the inclination of Socrates, yet afterwards stood him in good stead: for his father dying, and his money and effects being lost by being placed in bad hands, he was necessitated to continue his trade for ordinary subsistence. But being naturally averse to this profession, he only followed it when necessity compelled him; and upon getting a little before-hand, would for a while lay it entirely aside. These intermissions of his trade were bestowed upon philosophy, to which he was naturally addicted; and this being observed by Crito, a rich philosopher of Athens, Socrates was at length taken from his shop, and put into a condition of philosophising at his ease and leisure.

The first master of Socrates was Anaxagoras, and then Archelaus: by the last of whom he was much beloved, and travelled with him to Samos, to Pytho, and to the Isthmus. He was scholar likewise of Damon, whom Plato calls a *most pleasing teacher of music*, and of all other things that he himself would teach to young men. He heard also Prodicus the sophist; to which must be added Diotyma and Aspasia, women excellently learned. Diotyma was supposed to have been inspired with a spirit of prophecy; and Aspasia taught him rhetoric. Of Euenus he learned poetry; of Ichomachus, husbandry; of Theodorus, geometry.

At length he began himself to teach; and was so eloquent, that he could lead the mind to approve or disapprove whatever he pleased; but never used this talent for any other purpose than to conduct his fellow-citizens into the path of virtue. As to his school, and the particular method of his teaching, Plato mentions the academy Lycæum, and a pleasant meadow without the city on the side of the river Ilyssus, as places frequented by him and his auditors. Xenophon affirms, that he was continually abroad; that in the morning he visited the places of public walking and exercise; when it was full, the forum; and that the rest of the

day.

Socrates.

day he fought out the most populous meetings, where he disputed openly for every one to hear that would: and Plutarch relates, that he did not only teach when the benches were prepared, and himself in the chair, or in set hours of reading and discourse, or at appointments in walking with his friends; but even when he played, or eat, or drank, or was in the camp or market, or finally when he was in prison: thus making every place a school of virtue. His method of rousing the soul, and enabling her to recollect her own original ideas, was twofold; by irony, and induction. He is said to have exceeded all men living in irony. His way was, to lessen and detract from himself in disputation, and to attribute somewhat more to those he meant to confute; so that he always dissembled with much gravity his own opinions, till he had led others, by a series of questions, called *induction*, to the point he aimed at. He professed only to know this, "That he knew nothing;" and used modestly to say, that his skill resembled that of his mother, "he being nothing more than a kind of midwife, who assisted others in bringing forth what they had within themselves." However, he was, as Xenophon represents him, excellent in all kinds of learning. Xenophon instances only in arithmetic, geometry, and astrology: Plato mentions natural philosophy; Idomeneus, rhetoric; Laertius, medicine. Cicero affirms, that by the testimony of all the learned, and the judgment of all Greece, he was, as well in wisdom, acuteness, politeness, and subtlety, as in eloquence, variety, and richness, in whatever he applied himself to, without exception, the prince of all. As to his philosophy, it may be necessary to observe, that having searched into all kinds of science, he noted these inconveniences and imperfections: first, that it was wrong to neglect those things which concern human life, for the sake of inquiring into those things which do not; secondly, that the things men have usually made the objects of their inquiries, are above the reach of human understanding, and the source of all the disputes, errors, and superstitions, which have prevailed in the world; and thirdly, that such divine mysteries cannot be made subservient to the uses of human life. Thus esteeming speculative knowledge, so far only as it conduces to practice, he cut off in all the sciences what he conceived to be of least use. In short, remarking how little advantage speculation brought to mankind, he reduced her to action: and thus, says Cicero, "first called philosophy away from things involved by nature in impenetrable secrecy, which had yet employed all the philosophers till his time, and brought her to common life, to inquire after virtue and vice, good and evil." See *SOCRATIC Philosophy*.

That Socrates had an attendant spirit, genius, or dæmon, which diverted from dangers, is testified by Plato, Xenophon, and Antisthenes, who were his contemporaries, and confirmed by innumerable authors of antiquity; but what this attendant spirit, genius, or dæmon was, or what we are to understand by it, neither ancient nor modern writers have been able to determine. There is some disagreement concerning the name, and more concerning the nature of it: only it is agreed, that the advice it gave him was always dissuasive; "never impelling," says Cicero, "but often restraining him." It is commonly named his *dæmon*,

Socrates.

by which title he himself owned it. Plato sometimes calls it his *guardian*, and Apuleius his *god*; because the name of *dæmon*, as St Austin tells us, at last grew odious. As for the sign or manner in which this dæmon or genius foretold, and by foretelling guarded him against evils to come, nothing certain can be collected about it. Plutarch conjectured, first, that it might be some apparition; but at last concludes, that it was his observation of some inarticulate unaccustomed sound or voice, conveyed to him by some extraordinary way, as we see in dreams. Others confine this foreknowledge of evils within the soul of Socrates himself; and when he said, that "his genius advised him," interpret him as if he had said, that "his mind foreboded and so inclined him." But this is said to be inconsistent with the description which Socrates himself gives of a voice and signs from without. Lastly, some conceive it to be one of those spirits that have a particular care of men; which Maximus Tyrius and Apuleius describe in such a manner, that they want only the name of a *good angel*: and this Lactantius has supplied, when having proved, that God sends angels to guard mankind, he adds, "and Socrates affirmed, that there was a dæmon constantly near him, which had kept him company from a child, and by whose beck and instruction he guided his life."

It is observed by many, that Socrates little affected travel; his life being wholly spent at home, excepting when he went out upon military services. In the Peloponnesian war, he was thrice personally engaged: first, at the siege of Potidæa; secondly, at Delium, a town in Boeotia, which the Athenians took; and thirdly, at Amphipolis, when it was taken by Brasidas the Lacedæmonian general. We are told in Plutarch's Symposium, and in the person of Alcibiades, that "he outwent all the soldiers in hardiness; and if at any time, (saith Alcibiades), as it often happens in war, the provisions failed, there were none who could bear the want of meat and drink like Socrates; yet, on the other hand, in times of feasting, he alone seemed to enjoy them: and though of himself he would not drink, yet being invited, he far out-drunk every body, and (which is most strange) was never seen drunk."—He forbore to accept any office in the commonwealth, except in his latter years that of senator: either, as Ælian saith, because he saw the Athenian government approaching to a tyranny; or, as himself professeth, because he was dissuaded by his dæmon from meddling in public affairs.

To this great philosopher Greece was principally obliged for her glory and splendour. He formed the manners of the most celebrated persons of Greece, as Alcibiades, Xenophon, Plato, &c. But his services and the great qualities of his mind could not secure him from envy, persecution, and calumny. The 30 tyrants forbade his instructing youth; and as he derided the plurality of the Pagan deities, he was charged with impiety. The day of trial being come, Socrates made his own defence, without procuring an advocate, as the custom was, to plead for him. He did not defend himself with the tone and language of a suppliant or guilty person, but, as if he were master of the judges themselves, with freedom, firmness, and some degree of contumacy. Many of his friends also spoke in his behalf; and lastly, Plato went up into the chair, and began

began a speech in these words: "Though I, Athenians, am the youngest of those that come up into this place"—but they stopped him, crying out, "of those that go down," which he was thereupon constrained to do; and then proceeding to vote, they cast Socrates by 281 voices. It was the custom of Athens, as Cicero informs us, when any one was cast, if the fault were not capital, to impose a pecuniary mulct; when the guilty person was asked the highest rate at which he estimated his offence. This was proposed to Socrates, who told the judges, that to pay a penalty was to own an offence; and that, instead of being condemned for what he stood accused, he deserved to be maintained at the public charge out of the Prytæneum. This was the greatest honour the Grecians could confer: and the answer so exasperated the judges, that they condemned him to death by 80 votes more.

The sentence being passed, he was sent to prison: which, says Seneca, he entered with the same resolution and firmness with which he had opposed the 30 tyrants; and took away all ignominy from the place, which could not be a prison while he was there. He lay here in fetters 30 days; and was constantly visited by Crito, Plato, and other friends, with whom he passed the time in dispute after his usual manner. He was often solicited by them to an escape; which he not only refused, but derided; asking, "If they knew any place out of Attica whither death would not come?" The manner of his death is thus related by Plato, who was an eye-witness of it. "Socrates, the day he was to die, had been discoursing to his friends upon the immortality of the soul; and "when he had made an end of speaking, Crito asked him, if he had any directions to give concerning his sons or other things in which they could serve him? I desire no more of you, said Socrates, than what I have always told you: if you take care of yourselves, whatsoever you do will be acceptable to me and mine, though you promise nothing; if you neglect yourselves and virtue, you can do nothing acceptable to us, though you promise ever so much." That, answered Crito, we will observe; but how will you be buried? "As you think good," says he, "if you can catch me, and I do not give you the slip." Then with a smile applying himself to us, "I cannot persuade Crito," says he, "that I am that Socrates who was haranguing just now, or any thing more than the carcass you will presently behold; and therefore he is taking all this care of my interment. It seems that what I just now explained in a long discourse, has made no impression at all upon him; namely, that as soon as I shall have drank the poison, I shall not remain longer with you, but depart immediately to the seats of the blessed. These things, with which I have been endeavouring to comfort you and myself, have been said to no purpose. As therefore Crito was bound to the judges for my appearance, so you must now be bound to Crito for my departure; and when he sees my body burnt or buried, let him not say, that Socrates suffers any thing, or is in any way concerned: for know, dear Crito, such a mistake were a wrong to my soul. I tell you, that my body is only buried; and let that be done as you shall think fit, or as shall be most agreeable to the laws and customs of the country." This said, he arose and retired to an inner room, taking Crito with him, and leaving us, who like

orphans were to be deprived of so dear a father, to discourse upon our own misery. After his bathing, came his wife, and the other women of his family, with his sons, two of them children, one of them a youth; and when he had given proper directions about his domestic affairs, he dismissed them and came out to us. It was now near sun-set, for he had staid long within; when coming out he sat down, and did not speak much after. Then entered an officer, and approaching him said, Socrates, I am persuaded that I shall have no reason to blame you, for what I have been accustomed to blame in others; who have been angry at me and loaded me with curses, for only doing what the magistrate commands, when I have presented the poison to them. But I know you to be the most generous, the most mild, the best of all men that ever entered this place; and am certain, that if you entertain any repentment upon this occasion, it will not be at me, but at the real authors of your misfortune. You know the message I bring: farewell; and endeavour to bear with patience what must be borne. "And (said Socrates to the officer, who went out weeping) fare thee well: I will. How civil is this man! I have found him the same all the time of my imprisonment: he would often visit me, sometimes discourse with me, always used me kindly; and now see how generously he weeps for me. But come, Crito; let us do as he bids us: if the poison be ready, let it be brought in; if not, let somebody prepare it." The sun is yet among the mountains, and not set, says Crito: I myself have seen others drink it later, who have even eat and drank freely with their friends after the sign has been given; be not in haste, there is time enough. "Why, yes, (says Socrates): they who do so, think they gain something! but what shall I gain by drinking it late? Nothing, but to be laughed at for appearing too desirous of life; pray, let it be as I say." Then Crito sent one of the attendants, who immediately returned, and with him the man who was to administer the poison, bringing a cup in his hand; to whom Socrates said, "Prithee, my good friend, for thou art versed in these things, what must I do?" Nothing, said the man, but walk about as soon as you shall have drank, till you perceive your legs to fail; and then sit down. Then he presented the cup; which Socrates took without the least change of countenance, or any emotion whatever, and swallowed the draught with the greatest ease. Many of us, who till then had refrained from tears, when we saw him put the cup to his mouth and drink off the poison, were not able to refrain any longer, but gave vent to our grief; which Socrates observing, "Friends, (said he), what mean you? I sent away the women for no other reason but that they might not disturb us with this; for I have heard, that we should die with gratulation and applause: be quiet then, and behave yourselves like men." These words made us with shame suppress our tears. When he had walked a while, and perceived his legs to fail, he lay down on his back, as the executioner directed; who in a little time looking upon his feet, and pinching them pretty hard, asked him if he perceived it? Socrates said, "No." Then he did the same by his legs; and showing us how every part successively grew cold and stiff, observed, that when that chillness reached his heart, he would die. After ly-

Socrates. ing a while, he stretched himself forth ; when the executioner uncovering him found his eyes fixed, which were closed by Crato. This, says Plato, was the end of the best, the wisest, and the justest of men.' And this account of it by Plato, Tully professes, he could never read without tears.

He died, according to Plato, when he was more than 70 years of age. He was buried with many tears and much solemnity by his friends, among whom the excessive grief of Plato is observed by Plutarch : yet as soon as they had performed that last service, fearing the cruelty of the 30 tyrants, they stole out of the city ; the greater part to Megara, to Euclid, who received them kindly ; the rest to other places. Soon after, however, the Athenians were awakened to a sense of the injustice they had committed against Socrates ; and became so exasperated, that nothing would serve them but that the authors of it should be put to death ; as Melitus was, while Anytus was banished. In farther testimony of their penitence, they called home his friends to their former liberty of meeting ; they forbade public spectacles of games and wrestlings for a time ; they caused his statue, made in brass by Lyfippus, to be set up in the Pompeium ; and a plague ensuing, which they imputed to this unjust act, they made an order that no man should mention Socrates publicly and on the theatre, in order to forget the sooner what they had done.

As to his person, he was very homely ; was bald, had a dark complexion, a flat nose, eyes flicking out, and a severe downcast look. In short, his countenance promised so ill, that Zopyrus a physiognomist pronounced him incident to various passions, and given to many vices ; which when Alcibiades and others that were present laughed at, knowing him to be free from every thing of that kind, Socrates justified the skill of Zopyrus, by owning, that " he was by nature prone to those vices, but suppressed his inclination by reason." The defects of his person were amply compensated by the virtues and accomplishments of his mind. The oracle at Delphi declared him the wisest of all men, for professing only to know that he knew nothing : Apollo, as Tully says, conceiving the only wisdom of mankind to consist in not thinking themselves to know those things of which they are ignorant. He was a man of all virtues ; and so remarkably frugal, that how little soever he had, it was always enough. When he was amidst a great variety of rich and expensive objects, he would often say to himself, " How many things are there which I do not want !"

He had two wives, one of which was the noted Xantippe ; whom Aulus Gellius describes as an accursed froward woman, chiding and scolding always, by day and by night. Several instances are recorded of her impatience and his long-suffering. One day before some of his friends, she fell into the usual extravagances of her passion ; when he, without answering a word, went abroad with them : but he was no sooner out of the door, than she, running up into the chamber, threw water down upon his head ; upon which, turning to his friends, " Did not I tell you (says he), that after so much thunder we should have rain ?" Another time she pulled his cloak from his shoulders in the open forum ; and some of his friends advising him to

beat her, " Yes, (says he), that while we two fight, you may all stand by, and cry, Well done Socrates ; to him, Xantippe !" He chose his wife, we are told, for the same reason that those who would excel in horsemanship choose the roughest and most spirited horses ; supposing if they are able to manage them, they may be able to manage any other. It is doubtful whether Socrates ever convinced any one beside himself by this reasoning ; or whether he owes any part of his reputation for wisdom, to this rule for choosing a wife !

They who affirm that Socrates wrote nothing, as Cicero, Plutarch, and others, mean only in respect to his philosophy ; for it is attested and allowed, that he assisted Euripides in composing tragedies, and was the author of some pieces of poetry. Dialogues also, and epistles, are ascribed to him. His philosophical disputations were committed to writing by his scholars ; by Plato and Xenophon chiefly. Xenophon set the example to the rest in doing it first, and also with the greatest punctuality ; as Plato did it with the most liberty, intermixing so much of his own, that it is not easy, if possible, to distinguish the master from the scholar. Hence Socrates, hearing him recite his *Lyfiss*, cried out, " How many things doth this young man feign of me !"

SOCRATES, was also the name of an ecclesiastical historian of the 5th century, born at Constantinople in the beginning of the reign of Theodosius : he professed the law, and pleaded at the bar, whence he obtained the name of *Scholaslicus*. He wrote an ecclesiastical history from the year 309, where Eusebius ended, down to 440 ; and wrote with great exactness and judgment. An edition of Eusebius and Socrates, in Greek and Latin, with notes by Reading, was published at London in 1720.

SOCRATIC PHILOSOPHY, the doctrines and opinions with regard to morality and religion, maintained and taught by SOCRATES. To him is ascribed the first introduction of moral philosophy, which is what is meant by that usual saying, " That Socrates first called philosophy down from heaven to earth ; that is, from the contemplation of the heavens and heavenly bodies, he led men to consider themselves, their own passions, opinions, faculties, duties, actions, &c."—Man, who was the sole subject of his philosophy, having a twofold relation to things divine and human, his doctrines were with regard to the former metaphysical, to the latter moral. The morality of Socrates we shall pass over, as resembling in its general branches what others taught in common with him ; yet more pure, more exact, more refined. His metaphysical opinions are thus collected out of Plato, Xenophon, Plutarch, and others. " There are three principles of all things, God, matter, and ideas. God is the universal intellect : matter the subject of generation and corruption : idea, an incorporeal substance, the intellect of God ; God the intellect of the world.—God is one, perfect in himself, giving the being and well-being of every creature ; what he is, I know not ; what he is not, I know.—That God, not chance, made the world and all creatures, is demonstrable from the reasonable disposition of their parts, as well for use as defence ; from their care to preserve themselves, and continue their species.—That he particularly regards

Socrates,
Socrates.

Socratic,
Soda.

gards man in his body, appears from the noble upright form thereof, and from the gift of speech; in his soul, from the excellency thereof above others.—That God takes care of all creatures, is demonstrable from the benefit he gives them of light, water, fire, and fruits of the earth in due season: that he hath a particular regard of man, from the destination of all plants and creatures for his service; from their subjection to man, though they exceeded him ever so much in strength; from the variety of man's sense, accommodated to the variety of objects, for necessity, use, and pleasure; from reason, whereby he discourseth through reminiscence from sensible objects; from speech, whereby he communicates all he knows, gives laws, and governs states; finally, that God, though invisible himself, is such and so great, that he at once sees all, hears all, is everywhere, and orders all." As to the other great object of metaphysical research, the soul, Socrates taught, that "it is pre-existent to the body, endued with the knowledge of eternal ideas, which in her union to the body she loseth, as stupefied, until awakened by discourse from sensible objects; on which account all her learning is only reminiscence, a recovery of her first knowledge: that the body being compounded is dissolved by death; but that the soul being simple passeth into another life, incapable of corruption: that the souls of men are divine: that the souls of the good after death are in a happy estate, united to God in a blessed inaccessible place; that the bad in convenient places suffer condign punishment: but that to define what those places are, is the attempt of a man who hath no understanding; whence, being once asked what things were in the other world? he answered, "Neither was I ever there, nor ever did I speak with any that came from thence."

All the Grecian family of philosophers refer their origin to the discipline of Socrates; particularly the Platonics, Peripatetics, Academics, Cyrenaics, Stoics, &c. but the greatest part of his philosophy we have in the works of Plato.

SODA (*SALT of*), a name for the fossile alkali, or basis of sea-salt. In the eastern countries this alkali is found native, either in a pretty pure state, or mixed with earthy substances, from which it is easily separated by means of water; and Dr Heberden found it in considerable plenty on the peak of Teneriffe. It is also obtained from the ashes of the plant kali, and from those of the alga marina, which last form our kelp; but this is the most impure state in which it ever is obtained. The best sort of that artificially procured is made by burning the plant kali; and is prepared at Alicante in Spain, from an annual procumbent kali with short leaves like those of horseleek. These ashes are called *soude* or *sode* in France, where they are used as one of the common kinds of potash. They are brought to this country under the name of *Spanish ashes*, *bariglia* or *barilla*, in hard spongy masses, partly whitish or grey, and partly blackish. From these the saline part is extracted pure by powdering and dissolving in water. This, however, contains also a portion of vegetable alkali, and some sea-salt. A work has lately been erected in England for decomposing sea-salt and extracting the pure alkali from it, which is commonly sold in the shops under the name of *English pearl-ashes*; but it

is much less pure than that which comes from Alicante; being mixed with a large quantity of sea-salt. The process for decomposing the salt in this work is said to be mixing it with lime, and taking off the saline efflorescence which appears on the surface.

This mineral alkali will saturate fully as much acid as the vegetable, though its attraction for acids is not so great. It is certain, that if a quantity of vegetable alkali be added to a solution of Glauber's salt, or to sea-salt, they will be decomposed, and the mineral alkali will be obtained in its pure form: but whether this would also take place if the vegetable alkali were deprived of its fixed air, has not been ascertained; indeed it has been observed, that the two alkalis when rendered caustic are much less easily distinguished than when combined with fixed air. The mineral alkali easily then distinguishes itself by its superior mildness and readiness to crystallize. For the combinations of the salt of soda, see CHEMISTRY, n° 124, 185, 231, 270, 275, 296.

SODA is also a name for a heat in the stomach, or heart-burn. See MEDICINE, n° 406.

SODOM, formerly a town of Palestine in Asia, famous in scripture for the wickedness of its inhabitants, and their destruction by fire from heaven on account of that wickedness. The place where it stood is now covered by the waters of the Dead Sea, or the Lake Asphaltites.

SODOMY, the unnatural crime of buggery, thus called from the city of Sodom, which was destroyed by fire for the same. See BUGGERY.

The Levitical law adjudged those guilty of this execrable crime to death; and the civil law affixes the same punishment to it. The law of England makes it felony. There is no statute in Scotland against Sodomy; the libel of the crime is therefore founded on the divine law, and practice makes its punishment to be burned alive.

SODOR, a little village in Columbkil, one of the western isles of Scotland, near that of Mull. It was formerly a bishop's see, which comprehended all the islands, together with the isle of Man; for which reason the bishop is still called the *bishop of Sodor and Man*.

SOFA, in the Turkish customs, a bench of wood raised from the ground about a foot high, and placed round a hall or chamber for the people to sit down upon or to lie along, and in that posture to take a view of what passes in the streets, &c. for these benches are surrounded with windows; they are covered with fine Turkey carpets; and upon that are placed cushions of satin flowered with gold, or some other rich stuff.

SOFFITA, or **SOFFIT**, in architecture, any plafond or ceiling formed of cross beams of flying corniches, the square compartments or panels of which are enriched with sculpture, painting, or gilding; such are those in the palaces of Italy, and in the apartments of Luxembourg at Paris.

SOFI, or **SOPHI**. See **SOPHI**.

SOFTENING, in painting, the mixing and diluting of colours with the brush or pencil.

SOIL, in agriculture and gardening, denotes earth or ground considered with regard to the quality of its mould for the production and growth of vegetables. See EARTH.

Soissons
||
Solanum.

SOISSONS, an ancient, large, and considerable town, in the isle of France, and capital of the Soissonnois, with a bishop's see. The cathedral has one of the most considerable chapters in the kingdom; and the bishop, when the archbishop of Rheims is absent, has a right to consecrate the king. It has 12 parishes, 6 abbeys, and a French academy, founded in 1694; is seated in a very pleasant and fertile valley, on the river Aisne, 30 miles west of Rheims, and 60 north-east of Paris. E. Long. 3. 24. N. Lat. 49. 23. The Soissonnois is bounded on the north by Laonnois; on the east by Champagne; on the south by La Brie; and on the west by Valois. It bounds in corn, wood, and pastures.

SOKE, or **SOC**. See **SOCAGE**.

SOKEMANS. See **Soc** and **SOCAGE**.

SOL, in music, the fifth note of the gammut, *ut, re, mi, fa, sol, la*. See **GAMMUT**.

SOL, or *Sou*, a French coin made up of copper mixed with a little silver. See the article **COIN**.

SOL, the *Sun*, in astronomy, astrology, &c. See **ASTRONOMY**, *passim*.

SOL, in chemistry, is gold; thus called from an opinion that this metal is in a particular manner under the influence of the sun.

SOL, in heraldry, denotes *Or*, the golden colour in the arms of sovereign princes.

SOLÆUS, or **SOLARIS**, in anatomy, one of the extensor muscles of the foot, rising from the upper and hinder part of the tibia and fibula.

SOLAND-GOOSE, in ornithology. See **PELICANUS**.

SOLANUM, **NIGHTSHADE**, comprehending the love-apple and potato; a genus of the monogynia order, belonging to the pentandria class of plants. There are 30 species; the most remarkable of which are, 1. The lycopericon, wolf's peach, love-apple, or tomentos, rises with strong herbaceous procumbent stalks branching out to the length of six or eight feet with large pinnated, rank-scented leaves, with four or five pairs of cut lobes, and simple racemous clusters of small yellow flowers at the axillæ, succeeded by large compressed roundish furrowed fruit, of a red colour and soft. The varieties are, the common large love-apple, with furrowed fruit; the cherry-fruited love-apple, having smooth round fruit of a red colour, the size of large cherries; yellow cherry-fruited; scentless-leaved; and burnt-leaved. It is a native of the hot parts of America. 2. The nigrum, or common black nightshade, rises with upright herbaceous stalks, branching two or three feet high; oval, angular, indented leaves; and, from the sides of the branches, roundish nodding umbels of white flowers succeeded by black and other coloured berries in the varieties. 3. The dulcamara, bitter sweet, or climbing woody night-shade, rises with long flexuous, inermous, woody stalks, climbing by support many feet high; oblong, pointed leaves, with the upper ones halbert-shaped; and cymose clusters of small blue flowers, succeeded by bunches of small, oval, red berries. The varieties are, the white flowered; the variegated white striped leaved; gold striped leaved; the African thick leaved, formerly considered as a distinct species, but now found to be only a variety of this. 4. The tuberosum, tuberos-rooted, Peruvian nightshade, commonly called po-

tato. This hath a tuberous root, emitting numerous fibres, productive of many roundish and oblongish fleshy, edible tubers. Immediately from the root rise herbaceous, flexuose, smooth stalks, somewhat erectly, a yard long, garnished with large pinnated leaves, of several pair of entire lobes, and terminated by subdivided peduncles supporting bunches of small purple or white flowers in the different varieties, and succeeded by ripe seed in autumn. This species comprehends two principal varieties, viz. the red-rooted potato with white flowers, and the white-rooted potato with white flowers. Each of these comprehends several intermediate ones, such as the round red, oblong red, pale red, rough red, smooth red, red and white, early dwarf red, kidney-shaped white potato, round white, large oblong white, large red-ended white kidney shaped; large conglomerated American potato, being generally clustered together considerably, each root or tuber attaining a prodigious large size, and principally in estimation for feeding of cattle.

Culture. The first species, though a native of hot climates, will succeed here in the open air in summer, being previously raised in hot-beds, and thence transplanted. As it is a trailing plant, it should be well supported by walls, pales, or stakes, and should also have a sunny situation, or the fruit will not ripen. The common black nightshade grows wild in gardens, fields, and dunnhills, in this country; and becoming a troublesome weed, is rarely cultivated. The dulcamara is also hardy, and will succeed any where; excepting the African thick-leaved kind, which requires to be potted, and treated as a green-house plant. It is propagated by layers and cuttings.—The method of cultivating and managing potatoes is mentioned under the articles **AGRICULTURE**, n° 127—129, and **POTATO**.

Uses. The leaves of the deadly nightshade have been supposed discutient and cooling when applied externally, and poisonous when taken inwardly. Of late it has been shown, that an infusion of half a grain, or a grain, of the dried leaves, may be taken with safety, and that afterwards the dose may by degrees be increased to five or six grains. They generally occasion some considerable evacuation, and sometimes, especially when taken in large doses, alarming disturbances in the nervous system; which, however, go off with the operation of the medicine. It was expected, that the great activity of this vegetable would make it very serviceable in many obdurate disorders; but this expectation has not been verified by experience, and the colleges both of London and Edinburgh have rejected these leaves from their materia medica. The twigs and roots of the dulcamara, or woody nightshade, have been recommended as deobstruents for resolving coagulated blood, &c. and are generally said to occasion some considerable evacuation by sweat, wine, or stool, particularly the latter. The fruit of the lycopericon is of great estimation in Spain and Portugal for improving soups, also for stewing, fauces, &c. The uses of the potato as an esculent plant are well known.

SOLAR, something belonging to the *SUN*.

SOLAR SPOTS. See **SPOTS**, and **ASTRONOMY**, n° 14—18. 33, 34, 35. 39.

SOLDER, **SODDER**, or *soder*, a metallic or mineral

Solanum
Soldier.

Soldering, **Solder.** **ral composition** used in soldering or joining together other metals. See the next article.

Solders are made of gold, silver, copper, tin, bismuth, and lead; usually observing, that in the composition there be some of the metal that is to be soldered mixed with some higher and finer metals. Goldsmiths usually make four kinds of folder, viz. folder of eight, where to seven parts of silver there is one of brass or copper; folder of six, where only a sixth part is copper; folder of four, and folder of three. It is the mixture of copper in the folder that makes raised plate come always cheaper than flat. The folder used by plumbers is made of two pounds of lead to one of block-tin. Its goodness is tried by melting it and pouring the bigness of a crown-piece upon a table; for if good, there will arise little bright shining stars therein. The folder for copper is made, like that of the plumbers, only with copper and tin; for very nice works, instead of tin they sometimes use a quantity of silver. Solder for tin is made of two thirds of tin and one of lead; but where the work is any thing delicate, as in organ-pipes, where the juncture is scarce discernable, it is made of one part of bismuth and three parts of pewter.

SOLDERING, among mechanics, the joining and fastening together two pieces of the same metal, or of two different metals, by the fusion and application of some metallic composition on the extremities of the metals to be joined. See the preceding article.

To folder upon silver, brass, or iron: Take silver, five pennyweight; brass, four pennyweight; melt them together for soft folder, which runs soonest. Take silver, five pennyweight; copper, three pennyweight; melt them together for hard folder. Beat the folder thin, and lay it on the place to be soldered, which must be first fitted and bound together with wire, as occasion requires; then take borax in powder, and temper it like pap, and lay it upon the folder, letting it dry; then cover it with quick coals, and blow, and it will run immediately; take it presently out of the fire, and it is done. It is to be observed, that if any thing is to be soldered in two places, which cannot well be done at one time, you must first folder with the harder folder, and then with the soft; for if it be first done with the soft, it will unfold again before the other is fastened. Let it be observed, that if you would not have your folder run about the piece that is to be soldered, you must rub such places over with chalk.—In the foldering either of gold, silver, copper, or either of the metals above-mentioned, there is generally used borax in powder, and sometimes rosin. As to iron, it is sufficient that it be heated red hot, and the two extremities thus hammered together, by which means they will become incorporated with each other. For the finer kinds of iron and steel instruments, however, gold proves an excellent folder. This metal will dissolve twice or thrice its weight of iron in a degree of heat very far less than that in which iron itself melts; hence, if a small plate of gold is wrapped round the parts to be joined, and afterwards melted by a blow-pipe, it strongly unites the pieces together without any injury to the instrument, however delicate.

SOLDIER, a military man lifted to serve a prince or state in consideration of a certain daily pay.

SOLDIER-Grub. See **CANCER.**

SOLE, in the manege, a nail or fort of horn under a horse's foot, which is much more tender than the other horn that encompasses the foot, and by reason of its hardness is properly called the *horn* or *hoof*.

SOLE, in ichthyology. See **PLEURONECTES.**

SOLEÆ, among the Romans, a kind of sandals or slippers which covered only the sole of the feet, and bound on with thongs of leather; instead of which the women and the effeminate ones of the other sex, tied them on with purple coloured ribbons, or such as were curiously adorned with gold and silver.

SOLECISM, in grammar, a false manner of speaking, contrary to the use of language and the rules of grammar, either in respect of declension, conjugation, or syntax.—The word is Greek, *σολοκισμός*, derived from the *Soli*, a people of Attica, who being transplanted to Cilicia, lost the purity of their ancient tongue, and became ridiculous to the Athenians for their improprieties therein.

Solecisms, on some occasions, are pardonable: *Impetratum est à ratione ut peccare juvenitatis causa liceret.* Vaugelas is frequently repeating that of Quintilian, *Aliud est Latine, aliud grammaticè loqui.*

SOLEMN, something performed with much pomp, ceremony, and expence. Thus we say, solemn feasts, solemn funerals, solemn games, &c.—In law, *solemn* signifies something authentic, or that is clothed in all its formalities.

SOLE, the **RAZOR-FISH**, a genus of insects belonging to the order of vermes testacea. The shell is oblong, bivalved, and opening at both sides; the cardo has a subulated reflected tooth, not inserted into the opposite valve. There are eleven species, distinguished by peculiarities in their shells. Three of them, viz. the siliqua, vagina, and ensis, are found on the British coasts, and lurk in the sand near the low-water mark in a perpendicular direction. When in want of food, they elevate one end a little above the surface, and protrude their bodies far out of the shell. On the approach of danger they dart deep into the sand, sometimes two feet at least. Their place is known by a small dimple on the surface. Sometimes they are dug out with a shovel; at other times they are taken by striking a barbed dart suddenly into them. When the sea is down, these fish usually run deep into the sand; and to bring them up, the common custom is to throw a little salt into the holes, on which the fish raises itself, and in a few minutes appears at the mouth of its hole. When half the shell is discovered, the fisherman has nothing more to do than to take hold of it with his fingers and draw it out: but he must be cautious not to lose the occasion, for the creature does not continue a moment in that state; and if by any means the fisherman has touched it, and let it slip away, it is gone for ever; for it will not be decoyed again out of its hole by salt; so that there is then no way of getting it but by digging under it, and throwing it up with the sand. The fish has two pipes, each composed of four or five rings or portions of a hollow cylinder, of unequal lengths, joined one to another; and the places where they join are marked by a number of fine streaks or rays. Now the reason why the salt makes these creatures come up out of their holes, is, that it gives them violent pain, and

Soldier
||
Solen.

even corrodes these pipes. This is somewhat strange, as the creature is nourished by means of salt-water; but it is very evident, in that if a little salt be strewed upon these pipes in a fish taken out of its habitation, it will corrode the joinings of the rings, and often make one or more joints drop off: the creature, to avoid this mischief, arises out of its hole, and throws off the salt, and then retires back again. The use of these pipes to the animal, is the same with that of many other pipes of a like kind in other shell-fish; they all serve to take in water: they are only a continuation of the outer membrane of the fish, and serve indifferently for the taking in and throwing out the water, one receiving, and the other discharging it, and either answering equally well to their purpose.

When one of these fish is taken out of its hole, and laid upon the sand, if any thing touches it, it immediately gets in order for its progressive motion. It throws out a long cylindric part, of half the length of the shell, and of the shape of a clapper of a bell; this is suspended to the middle of the animal by a ligament, but in all other parts it is loose: this serves as a leg to the creature. As it lies upon the sand, it extends this about an inch from the end of the shell, and changes its cylindric figure to a flat one, which terminates in a point, flat and sharp at the edges; with this it opens its passage into the sand. When the opening is made, it extends this part still farther, and buries it deeper; and after this bends it back again in such a manner, that its point turns up towards the shell: thus it gives this part the figure of a hook, and by this hook it draws its whole body and shell down. In this attempt it brings the edges of the shells every where close together; and instead of lying flat upon the sand, it now by degrees gets into a vertical position, and then there remains nothing to do but to draw it deeper into the sand. To effect this, it now again extends its leg, which it easily passes into the sand in its flatted shape; and when it has thus pierced to its utmost length, the creature inflates, and extends it by degrees to the size of the shell, and to a round or cylindric figure; the consequence of which is, that there is now a hole made of the shape of the shell, and equal to its diameter, into which it can easily sink: to facilitate this, however, the creature swells out the extremity of the leg into a sort of button, which holding fast in its place, nothing more is necessary than to contract the rest of the leg, in order to pull down the shell after it. This operation is repeated as often as is necessary, and the creature, at every movement of this kind, getting down half the length of its shell, or thereabouts, is very soon plunged as deep as its occasions require.

When it has occasion to ascend out of its hole, the same leg serves for that purpose; nothing more being required, than the putting out the end of the leg, swelling it, and thus thrusting itself up to the length of that leg; then retracting it into the shell again, and thrusting out and inflating its end for a second movement of the same kind. These motions may be all perceived in the creature when out of the sand, particularly that by which it buries itself; for if held up in the fingers, it thrusts out the leg, and performs all the motions as if in the sand, making a fruitless attempt to save itself in its old way.

These fish were used as food by the ancients; and Athenæus, from Sophron, speaks of them as great delicacies, and particularly grateful to widows. They are often used as food at present, and are brought up to table fried in eggs.

SOLFAING, in music, the naming or pronouncing the several notes of a song by the syllables *ut, re, mi, fa, sol, &c.* in learning to sing it.

Of the seven notes in the French scale *ut, re, mi, fa, sol, la, si*, only four are used among us in singing, as *mi, fa, sol, la*: their office is principally, in singing, that by applying them to every note of the scale, it may not only be pronounced with more ease, but chiefly that by them the tones and semitones of the natural scale may be better marked out and distinguished. This design is obtained by the four syllables *fa, sol, la, mi*. Thus from *fa* to *sol* is a tone, also from *sol* to *la*, and from *la* to *mi*, without distinguishing the greater or less tone; but from *la* to *fa*, also from *mi* to *fa*, is only a semitone. If then these be applied in this order, *fa, sol, la, fa, sol, la, mi, fa, &c.* they express the natural series from C; and if that be repeated to a second or third octave, we see by them how to express all the different orders of tones and semi-tones in the diatonic scale; and still above *mi* will stand *fa, sol, la*, and below it the same inverted *la, sol, fa*, and one *mi* is always distant from another an octave; which cannot be said of any of the rest, because after *mi* ascending come always *fa, sol, la*, which are repeated invertedly descending.

To conceive the use of this, it is to be remembered, that the first thing in learning to sing, is to make one raise a scale of notes by tones and semi-tones to an octave, and descend again by the same; and then to raise and fall by greater intervals at a leap, as thirds and fourths, &c. and to do all this by beginning at notes of different pitch. Then those notes are represented by lines and spaces, to which these syllables are applied, and the learners taught to name each line and space thereby, which makes what we call *solfaing*; the use whereof is, that while they are learning to tune the degrees and intervals of sound, expressed by notes on a line or space, or learning a song to which no words are applied, they may not only do it the better by means of articulate sounds, but chiefly, that by knowing the degrees and intervals expressed by those syllables, they may more readily know the places of the semi-tones, and the true distance of the notes. See the article **SINGING**.

SOLFATERRA, a mountain of Italy in the kingdom of Naples, and Terra di Lavoro. This mountain appears evidently to have been a volcano in ancient times; and the soil is yet so hot, that the workmen employed there in making alum need nothing else, besides the heat of the ground, for evaporating their liquids †. Of this mountain we have the following account by Sir William Hamilton.—“Near Altruni (another mountain, formerly a volcano likewise) rises the Solfaterra, which not only retains its cone and crater, but much of its former heat. In the plain within the crater, smoke issues from many parts, as also from its sides: here, by means of stones and tiles heated over the crevices, through which the smoke passes, they collect in an awkward manner what they call *sale armoniaco*; and from the sand of the plain they extract sulphur

† See
Chemistry,
no 134.

Solfaterra,
Solicitor.

sulphur and alum. This spot, well attended to, might certainly produce a good revenue, whereas I doubt if they have hitherto ever cleared 200 l. a-year by it. The hollow sound produced by throwing a heavy stone on the plain of the crater of the Solfaterra, seems to indicate that it is supported by a sort of arched natural vault; and one is induced to think that there is a pool of water beneath this vault (which boils by the heat of a subterraneous fire still deeper), by the very moist steam that issues from the cracks in the plain of the Solfaterra, which, like that of boiling water, runs off a sword or knife, presented to it, in great drops. On the outside, and at the foot of the cone of the Solfaterra, towards the lake of Agnano, water rushes out of the rocks so hot, as to raise the quicksilver in Fahrenheit's thermometer to the degree of boiling water (A); a fact of which I was myself an eye-witness. This place, well worthy the observation of the curious, has been taken little notice of; it is called the *Pisciarrelli*. The common people of Naples have great faith in the efficacy of this water; and make much of it in all cutaneous disorders, as well as for another disorder that prevails here. It seems to be impregnated chiefly with sulphur and alum. When you approach your ear to the rocks of the Pisciarrelli, from whence this water issues, you hear a horrid boiling noise, which seems to proceed from the huge cauldron that may be supposed to be under the plain of the Solfaterra. On the other side of the Solfaterra, next the sea, there is a rock which has communicated with the sea, till part of it was cut away to make the road to Puzzole; this was undoubtedly a considerable lava, that ran from the Solfaterra when it was an active volcano. Under this rock of lava, which is more than 70 feet high, there is a stratum of pumice and ashes. This ancient lava is about a quarter of a mile broad; you meet with it abruptly before you come in sight of Puzzole, and it finishes as abruptly within about 100 paces of the town. The ancient name of the Solfaterra was *Forum Vulcani*; a strong proof of its origin from subterraneous fire. The degree of heat that the Solfaterra has preserved for so many ages, seems to have calcined the stones upon its cone and in its crater, as they are very white, and crumble easily in the hottest parts.

SOLICITOR, a person employed to take care of and manage suits depending in the courts of law or equity; and those of the lower sort, it is observed, are too often made use of, to the damage of the people, and the increase of champerty and maintenance. Solicitors are within the statute to be sworn, and admitted by the judges, before they are allowed to practise in our courts, in like manner as attorneys.

There is also a great officer of the law, next to the attorney-general, who is styled the king's solicitor-general; who holds his office by patent during the king's pleasure, has the care and concern of managing the king's affairs, and has fees for pleading, besides other fees arising by patents, &c. He hath his attendance on the privy-council; and the attorney-general and he were anciently reckoned among the officers of the exchequer; they have their audience, and come within the bar in all other courts.

SOLID, in philosophy, a body whose parts are so firmly connected together, as not to give way or slip from each other upon the smallest impression; in which sense *solid* stands opposed to *fluid*.

Geometricians define a solid to be the third species of magnitude, or that which has three dimensions, viz. length, breadth, and thickness or depth.

Solids are commonly divided into regular and irregular. The regular solids are those terminated by regular and equal planes, and are only five in number, viz. the tetrahedron, which consists of four equal triangles; the cube, or hexahedron, of six equal squares; the octahedron, of eight equal triangles; the dodecahedron, of twelve; and the icosahedron, of twenty equal triangles.

The irregular solids are almost infinite, comprehending all such as do not come under the definition of regular solids; as the sphere, cylinder, cone, parallelogram, prism, paralleloiped, &c.

SOLIDS, in anatomy, &c. denote the continent parts of the human body; being a congeries of pipes, or vessels, which contain a liquor.

The solid parts of the body, though equally composed of vessels, are different with regard to their consistence; some being hard, and others soft. The hard, as the bones and cartilages, give firmness and attitude to the body, and sustain the other parts: the soft parts, either alone or together with the hard, serve to execute the animal functions. See **ANATOMY**.

SOLIDITY, that property of matter, or body, by which it excludes all other bodies from the place which itself possesses; and as it would be absurd to suppose that two bodies could possess one and the same place at the same time, it follows, that the softest bodies are equally solid with the hardest.

Among geometricians, the solidity of a body denotes the quantity or space contained in it, and is called also its solid content.

SOLILOQUY, a reasoning or discourse which a man holds with himself; or, more properly, according to Papias, it is a discourse by way of answer to a question that a man proposes to himself.

Soliloquies are become very common things on the modern stage; yet can nothing be more artificial, or more unnatural, than an actor's making long speeches to himself, to convey his intentions to the audience. Where such discoveries are necessary to be made, the poet should rather take care to give the dramatic persons such confidants as may necessarily share their inmost thoughts; by which means they will be more naturally conveyed to the audience: yet is even this a shift an accurate poet would not be found to have occasion for. The use and abuse of soliloquies is well delivered by the duke of Buckingham in the following lines:

Soliloquies had need be very few.

Extremely short, and spoke in passion too.

Our lovers talking to themselves, for want

Of others, make the pit their confidant:

Not is the matter mended yet, if thus

They trust a friend, only to tell it us.

SOLIS (Antonio de), an ingenious Spanish writer, of an ancient and illustrious family, born at Placenza in

(A) I have remarked, that after a great fall of rain, the degree of heat in this water is much less; which will account for what the Padre Torre says, (in his book, intitled, *Histoire et Phenomenes du Vesuve*), that when he tried it in company with Monsieur de la Condamine, the degree of heat, upon Reaumur's thermometer, was 68°.

Solitary
Solstice.

in Old Castile, in 1610. He was intended to study the law; but his inclination toward poetry prevailed, and he cultivated it with great success. Philip IV. of Spain made him one of his secretaries; and after his death the queen-regent appointed him first historiographer of the Indies, a place of great profit and honour: his History of the Conquest of Mexico shows that she could not have named a fitter person. He is better known by this history abroad, than by his poetry and dramatic writings, though he was excellent in that way. He turned priest at 57 years of age, and died in 1686.

SOLITARY, something retired, or in private, remote from the company or commerce of others of the same species.

SOLITARIES, a denomination of nuns of St Peter of Alcantara, instituted in 1676, the design of which is to imitate the severe penitient life of that saint. Thus they are to keep a continual silence, never to open their mouths to any body but themselves; employ their time wholly in spiritual exercises, and leave the temporal concerns to a number of maids, who have a particular superior in a separate part of the monastery: they always go bare-footed, without sandals; gird themselves with a thick cord, and wear no linen.

SOLO, in music, a term used in pieces consisting of several parts, to mark those that are to perform alone.

SOLOMON, the son of David king of Israel, renowned in scripture for his wisdom, riches, and magnificent temple and other buildings. Towards the end of his life he sullied all his former glory by his apostasy from God; from which cause vengeance was denounced against his house and nation. He died about 975 B. C.

SOLOMON'S Seal, in botany; a species of *CONVOLVULARIA*.

SOLON, one of the seven wise men of Greece, was born at Athens about 369 B. C. His courage having procured him the government of his country, he abrogated Draco's laws, and published others more equitable. Pisistratus having made himself master of Athens, Solon retired into Lydia, where, Cræsus having asked him on a time if he did not think him happy? he answered, that none could be accounted so before their last breath; which Cræsus afterwards found fully verified. Solon died at the age of 80.

SOLSTICE, in astronomy, that time when the sun is in one of the solstitial points; that is, when he is at his greatest distance from the equator; thus called because he then appears to stand still, and not to change his distance from the equator for some time; an appearance owing to the obliquity of our sphere, and which those living under the equator are strangers to.

The solstices are two in each year; the æstival or summer solstice, and the hyemal or winter solstice. The summer solstice is when the sun seems to describe the tropic of cancer, which is on June 22. when he makes the longest day: the winter solstice is when the sun enters the first degree, or seems to describe the tropic of capricorn, which is on December 22. when he makes the shortest day. This is to be understood as in our northern hemisphere; for in the southern, the

sun's entrance into capricorn makes the summer solstice, and that into cancer the winter solstice. The two points of the ecliptic, wherein the sun's greatest ascent above the equator, and his descent below it, are terminated, are called the *solstitial points*; and a circle, supposed to pass through the poles of the world and these points, is called the *solstitial colure*. The summer solstitial point is in the beginning of the first degree of cancer, and is called the *æstival* or *summer point*; and the winter solstitial point is in the beginning of the first degree of capricorn, and is called the *winter point*. These two points are diametrically opposite to each other.

SOLUTION, in chemistry, denotes an intimate mixture of solid bodies with fluids, so as seemingly to form one homogeneous liquid: the dissolving fluid is termed the *dissolvent* or *menstruum*.

The most celebrated chemists have asserted, that water is capable of dissolving a certain proportion of salt without having its bulk increased thereby in the least; but, from some late experiments, this is contradicted; and it is maintained, that all salts, in whatever proportion they may be added, do actually increase the bulk of the solution, though, when the salt is at first thrown in, the bulk is constantly diminished. From these experiments it is also affirmed, that when water is completely saturated with one kind of salt, it will not take up any more of another, without letting fall some of the former.

SOLVENT, the same with dissolvent. See the article *DISSOLVENT*.

SOLWAY MOSS. See *Moving Moss*.

SOMBRERO, the name of an uninhabited island in the West Indies in the form of an hat, whence the name is derived. It is also the name of one of the Newbar islands in the East Indies.

SOMBRERO, *Wonderful Plant of*, is a strange kind of sensitive plant growing in the East Indies, in sandy bays and in shallow water. It appears like a slender straight stick; but when you attempt to touch it, immediately withdraws itself into the sand. Mr Miller gives an account of it in his description of Sumatra *. * *Phil. Transf.* vol. 68. p. 178. He never could observe any tentacula; but, after many unsuccessful attempts, drew out a broken piece about a foot long. It was perfectly straight and uniform, and resembled a worm drawn over a knitting needle. When dry it is a coral.

SOMERS (John), lord high chancellor of England, was born at Worcester in 1652. He was educated at Oxford, and afterward entered himself of the Middle-Temple, where he studied the law with great vigour. In 1688 he was of council for the seven bishops at their trial, and argued with great learning and eloquence against the dispensing power. In the convention which met by the prince of Orange's summons, January 22. 1689, he represented Worcester; and was one of the managers for the house of commons, at a conference with the house of lords upon the word *abdicated*. Soon after the accession of king William and queen Mary to the throne, he was appointed solicitor-general, and received the honour of knighthood. In 1692 he was made attorney-general, and in 1693 advanced to the post of lord keeper of the great seal of England. In 1695 he pro-

Solution
Somers.

Somer-
shire.

proposed an expedient to prevent the practice of clipping the coin. In 1697 he was created lord Somers, baron of Evesham, and made lord high chancellor of England. In the beginning of 1700 he was removed from his post of lord chancellor, and the year after was impeached of high crimes and misdemeanours by the house of commons, of which he was acquitted upon trial by the house of lords. He then retired to a studious course of life, and was chosen president of the royal society. In 1706 he proposed a bill for the regulation of the law; and the same year was one of the principal managers for the union between England and Scotland. In 1708 he was made lord president of the council; from which post he was removed in 1710, upon the change of the ministry. In the latter end of queen's Anne's reign, his lordship grew very infirm in his health; which indisposition is supposed to be the reason that he held no other post than a seat at the council-table, after the accession of king George I. He died of an apoplectic fit in 1716. Mr Addison has drawn his character very beautifully in the Freeholder.

SOMERSETSHIRE, a county of England, taking its name from Somerton, once the capital. It is bounded on the west by Devonshire, on the south by Dorsetshire, on the north by Bristol Channel or the Severn Sea, on the north-east by a small part of Gloucestershire, and on the east by Wiltshire. It is one of the largest counties in England, extending in length from east to west about 60 miles; in breadth, where broadest, from south to north, about 50; and 150 in circumference. It is divided into 42 hundreds, in which are 3 cities, 30 market-towns, 1700 villages, 385 parishes, of which 132 are vicarages, containing more than 100,000 of acres, and about 280,000 souls. It sends 18 members to parliament, viz. two for Bristol, two for Bath, two for Wells, two for Taunton, two for Bridgewater, two for Ilchester, two for Milbourn-port, and two for Minehead.

The air of this county is very mild and wholesome, especially that of the hilly part. The soil in general is exceeding rich, so that single acres very commonly produce forty or fifty bushels of wheat, and there have been instances of some producing sixty of barley. As there is very fine pasture both for sheep and black cattle, it abounds in both, which are as large as those of Lincolnshire, and their flesh of a finer grain. In consequence of this abundance of black cattle, great quantities of cheese are made in it, of which that of Cheddar is thought equal to Parmesan. In the hilly parts are found coal, lead, copper, lapis calaminaris, and okre. Wood thrives in it as well as in any county of the kingdom. It abounds also in pease, beans, beer, cyder, fruit, wild fowl, and salmon; and its mineral waters are celebrated all over the world.

The riches of this county, both natural and acquired, exceed those of any other in the kingdom, Middlesex and Yorkshire excepted. The woollen manufacture in all its branches is carried on to a very great extent; and in some parts of the county great quantities of linen are made. If to these the produce of various other commodities in which it abounds is added, the amount of the whole must undoubtedly be very great. Its foreign trade must also be allowed to be very extensive, when it is considered that it has a large trade for sea-coal, and possesses, besides other ports,

VOL. X.

that of Bristol, a town of the greatest trade in England, next to London.

Besides lesser streams, it is well watered and supplied with fish by the rivers Severn, Avon, Parrel, Froome, Ax, Torre, and Tone. Its greatest hills are Mendips, Poulton, and Quantock, of which the first abounds in coal, lead, &c. The rivers Severn and Parrel breed very fine salmon. The chief town is Bristol.

SOMNAMBULI, a name for persons who walk in their sleep. See **NOCTAMBULI**.

SOMNER (William), an eminent English antiquary in the 17th century, was born in 1606. His first treatise was that on the Antiquities of Canterbury (his native city), dedicated to archbishop Laud. He then applied himself to the study of the Saxon language; and having made himself master of it, he perceived that the old glossary prefixed to Sir Roger Twissden's edition of the laws of king Henry I. printed in 1644, was faulty in many places; he therefore wrote notes and observations, large and learned, on that edition, with a very useful glossary. His Treatise of Gavelkind was finished about 1648, though not published till 1660. Our author was zealously attached to king Charles I. and in 1648 he published a poem on his sufferings and death. His skill in the Saxon tongue led him to inquire into most of the European languages ancient and modern. He assisted Dugdale and Dodsworth in compiling the *Monasticon Anglicanum*. His Saxon Dictionary was printed at Oxford in 1659. He died in 1669.

SON, an appellation given to a male child considered in the relation he bears to his parents. See **PARENT and Child**.

SONATA, in music, a piece or composition, intended to be performed by instruments only; in which sense it stands opposed to *cantata*, or a piece designed for the voice. See **CANTATA**.

There are sonatas from one to eight parts; but usually they are performed by a single violin, or with two violins and a thorough-bass for the harpsichord, and frequently a more figured bass for the bass-viol.

Sonatas, though extremely numerous, are reduced by the Italians to two kinds: 1. Those proper for church-music, which usually begin with a grave and solemn motion, and afterwards strike into a brisker and gayer manner; these are what they more peculiarly call *sonatas*. 2. Those for the chamber, being little pieces for dancing.

SONG, in poetry, a little composition, consisting of easy and natural verses, set to a tune in order to be sung. See **POETRY**, n° 54.

SONG, in music, is applied in general to a single piece of music, whether contrived for the voice or an instrument. See **AIR**.

SONNA, a book of Mahometan traditions, where in all the orthodox muslimen are required to believe.

SONNET, in poetry, a composition contained in 14 verses, viz. two stanzas or measures of four verses each, and two of three, the eight first verses being all in three rhimes.

SONNITES, among the Mahometans, an appellation given to the orthodox muslimen or true believers; in opposition to the several heretical sects, particularly the Shiites, or followers of Ali.

SOOJU, or **SOY**. See **DOLICHOS**.

41 B

SOOT,

Sonnambuli

Soofju.

SOOT
||
Sorbon.

SOOT, a volatile matter arising from wood and other fuel along with the smoke; or rather, it is the smoke itself, fixed and gathered to the sides of the chimney. Though once volatile, however, soot cannot be again resolved into vapour; but, if distilled by a strong fire, yields a volatile alkali and empyreumatic oil, a considerable quantity of fixed matter remaining at the bottom of the distilling vessel. If burnt in an open fire, it flames with a thick smoke; from whence other soot is produced. It is used as a material for making sal ammoniac, and as a manure. See **CHEMISTRY**, n° 231; and **AGRICULTURE**, n° 21.

SOOT-Black. See **COLOUR Making**.

SOPHI, or **SOFI**, a title given to the emperor of Persia; importing as much as wise, sage, or philosopher. There is no prince in the world whose authority is more absolute than that of the sophi of Persia.

SOPHISM, in logic, &c. an argument which carries much of the appearance of truth, and yet leads into error.

SOPHIST, a person who uses sophisms with a view to deceive those he would persuade or convince.

SOPHISTICATION, the adulterating any thing with what is not good or genuine; a practice too common in the making up medicines for sale; as also among vintners, distillers, and others, who are accused of sophisticating their wines, spirits, oils, &c. by mixing with them cheaper and coarser materials; and in many cases the cheat is carried on so artfully as to deceive the best judges.

SOPHOCLES, the celebrated Greek tragic poet, was archon or chief magistrate of Athens; in which station he commanded the forces of the republic, and signalized himself by his valour on several occasions. Of 100 tragedies which he is supposed to have written, only seven have been preserved to our time: they are translated into Latin, with the Greek Scholia, by our countryman Johnson, and into English by Dr Franklin. Sophocles died about 406 B. C. aged 91.

SOPORIFIC, or **SOPORIFEROUS**, a medicine that has the faculty of procuring sleep. Such are opium, laudanum, &c. The word is formed from the Latin *sopor*, "sleep." The Greeks in lieu hereof use the word *hypnotic*.

SORBON, or **SORBONNE**, the house or college of the faculty of theology established in the university of Paris. It was founded in 1252 by St. Louis, or rather by Robert de Sorbon his confessor and almoner, first canon of Cambray, and afterwards of the church of Paris; who gave his own name to it, which he himself took from the village of Sorbon or Serbon, near Sens, where he was born. The foundation was laid in 1250; queen Blanche, in the absence of her husband, furnishing him with a house which had formerly been the palace of Julian the apostate, whereof some remains are still seen. Afterwards the king gave him all the houses he had in the same place, in exchange for some others in another. The college has been since magnificently rebuilt by the cardinal de Richelieu. The design of its institution was for the use of poor students in divinity. There are lodgings in it for 36 doctors, who are said to be of the *society of the Sorbonne*; those admitted into it without being doctors, are said to be of the *hospitality of the Sorbonne*. Six regent doctors hold lectures every day for an hour

and half each; three in the morning, and three in the afternoon.

SORBON, is also used in the general for the whole faculty of theology at Paris; in regard the assemblies of the whole body are held in the house of the Sorbon; and that the bachelors of the other houses of the faculty, as the house of Navarre, &c. come here to hold their *forbannique*, or act for being admitted doctor in divinity.

SORBUS, the **SERVICE TREE**: a genus of the trigynia order, belonging to the icelandia class of plants. There are three species. 1. The aucuparia, mountain-ash, quicken-tree, quick beam, or roan-tree, rises with a straight upright stem and regular branching head, twenty or thirty feet high or more, covered with a smooth greyish brown bark; pinnated leaves of eight or ten pair of long, narrow, serrated folioles, and an odd one, smooth on both sides; and large umbellate clusters of white flowers at the sides and ends of the branches, succeeded by clusters of fine red berries, ripe in autumn and winter. There is a variety yellow striped leaved. This species grows wild in many parts of this island, on mountainous places, woods, and hedge rows, often arriving to the growth of timber; and is admitted in most ornamental plantations, for the beauty of its growth, foliage, flowers, and fruit; the latter, in particular, being produced in numerous red large bunches all over the tree, exhibit a fine appearance in autumn and winter, till devoured by the birds, especially the blackbird and thrush, which are so allured by these fruit as to flock from all parts and feed on them voraciously. 2. The domestica, or cultivated service-tree, with eatable fruit, grows with an upright stem, branching thirty or forty feet high or more, having a brownish bark, and the young shoots in summer covered with a mealy down; pinnated leaves of eight or ten pair of broadish deeply serrated lobes and an odd one, downy underneath, and large umbellate clusters of white flowers at the sides and ends of the branches, succeeded by bunches of large, fleshy, edible red fruit, of various shapes and sizes in the varieties. This tree is a native of the southern warm parts of Europe, where its fruit is in high esteem to serve up in desserts, and is cultivated here in many of our gardens, both as a fruit-tree and to diversify hardy plantations. 3. The hebrida, or mongrel service-tree of Gothland, grows twenty or thirty feet high, it has half pinnated leaves, very downy underneath; and clusters of white flowers, succeeded by bunches of round reddish berries in autumn.

As to the merit of these trees in gardening, they all demand culture in every eminent shrubbery and other hardy plantations; being introduced as standards, they will effect a fine variety in assemblage, with their elegant pinnated leaves and clusters of flowers and fruit: the wild service particularly should be plentifully interperfed in all extensive shrubberies, for the singularity of their numerous clusters of berries in autumn and winter, which also prove food to encourage plenty of singing birds in the plantations. But the sorbus aucuparia may also be introduced as a forest-tree in timber plantations; and being mostly all heart, is valued for many purposes.

They are all easily propagated, by seed, in the open ground; also by layers, though the seedlings generally make the handsomest plants.

SOR.

Sorbus.

Sorex
||
Sorners.

SORCERY, (*fortilegium*), witchcraft, or divination by lots; a crime of which our ancient books are full, and of which we know not well what account to give. To deny the possibility, nay actual existence, of witchcraft and sorcery, is at once flatly to contradict the revealed word of God, in various passages both of the Old and New Testament; and the thing itself is a truth to which every nation in the world hath in its turn borne testimony, either by examples seemingly well attested, or by prohibitory laws, which at least suppose the possibility of a commerce with evil spirits. The civil law punishes with death not only the forerers themselves, but also those who consult them; imitating in the former the express law of God, "Thou shalt not suffer a witch to live." And our own laws, both before and since the conquest, have been equally penal; ranking this crime in the same class with heresy, and condemning both to the flames. The President Montesquieu ranks them also both together, but with a very different view; laying it down as an important maxim, that we ought to be very circumspect in the prosecution of magic and heresy; because the most unexceptionable conduct, the purest morals, and the constant practice of every duty in life, are not a sufficient security against the suspicion of crimes like these. And indeed, the ridiculous stories that are generally told, and the many impostures and delusions that have been discovered in all ages, are enough to demolish all faith in such a dubious crime, if the contrary evidence were not also extremely strong. Wherefore it seems to be the most eligible way to conclude, with an ingenious writer of our own, That in general there has been such a thing as witchcraft, though one cannot give credit to any particular modern instance of it.

Our forefathers were stronger believers when they enacted, by stat. 33 Hen. VIII. c. 8. all witchcraft and sorcery to be felony without benefit of clergy; and again, by stat. 1 Jac. I. c. 12. that all persons invoking any evil spirit, or consulting, covenanting with, entertaining, employing, feeding, or rewarding any evil spirit; or taking up dead bodies from their graves to be used in any witchcraft, sorcery, charm, or incantment; or killing or otherwise hurting any person by such infernal arts; should be guilty of felony without benefit of clergy, and suffer death. And if any person should attempt by sorcery to discover hidden treasure, or to restore stolen goods, or to provoke unlawful love, or to hurt any man or beast, though the same were not effected, he or she should suffer imprisonment and pillory for the first offence, and death for the second. These acts continued in force till lately, to the terror of all ancient females in the kingdom; and many poor wretches were sacrificed thereby to the prejudice of their neighbours and their own illusions, not a few having by some means or other confessed the fact at the gallows. But all executions for this dubious crime are now at an end; our legislature having at length followed the wise example of Louis XIV. in France, who thought proper by an edict to restrain the tribunals of justice from receiving informations of witchcraft. And accordingly it is with us enacted, by statute 9 Geo. II. c. 5. that no prosecution shall for the future be carried on against any person for conjuration, witchcraft, sorcery, or incantment. But the misdemeanor of persons pretending to

use witchcraft, tell fortunes, or discover stolen goods, by skill in the occult sciences, is still deservedly punished with a year's imprisonment, and standing four times in the pillory.

SOREX, the **SHREW-MOUSE**; a genus of quadrupeds, belonging to the order of glires. The most remarkable species are, 1. The araneus, or field shrew-mouse, with short rounded ears; eyes small, and almost hid in the fur; nose long and slender, upper part the longest; head and upper part of the body of a brownish red; belly of a dirty white; length, from nose to tail, two inches and a half; tail one and a half. Inhabits Europe: lives in old walls, heaps of stones, or holes in the earth; is frequently near hayricks, dunghills, and necessary-houses; lives on corn, insects, and any filth; is often observed rooting in ordure, like a hog; from its food, or the places it frequents, has a disagreeable smell; cats will kill, but not eat it: it brings four or five young at a time. The ancients believed it was injurious to cattle; an error now detected. There seems to be an annual mortality of these animals in August, numbers being then found dead in the paths.

2. The fodiens, or water-shrew, has a long slender nose; very minute ears; very small eyes, hid in the fur; colour of the head and upper part of the body black; throat, breast, and belly, of a light ash-colour; beneath the tail, a triangular dusky spot; much larger than the last; length, from nose to tail, three inches three quarters; tail, two inches. Inhabits Europe: long since known in England, but lost till May 1768, when it was discovered in the fens near Revelley Abbey, Lincolnshire; burrows in the banks near the water; is called by the fen-men the *blind mouse*.

3. The minutus, or minute shrew, has a head near as big as the body; very slender nose; broad short naked ears; whiskers reaching to the eyes; eyes small, and capable of being drawn in; hair very fine and shining; grey above, white beneath; no tail; the least of quadrupeds, according to Linnæus. Inhabits Siberia; lives in a nest made of lichens, in some moist place beneath the roots of trees; feeds on seeds; it diges; runs swiftly; has the voice of a bat.

4. The tucan, or Mexican shrew, has a sharp nose; small round ears; without sight; two long fore-teeth above and below; thick, fat, and fleshy body; short legs, so that the belly almost touches the ground; long crooked claws; tawny hair; short tail; length, from nose to tail, nine inches. Inhabits Mexico; burrows, and makes such a number of cavities, that travellers can scarce tread with safety; if it gets out of its hole, does not know how to return, but begins to dig another; grows very fat, and is eatable; feeds on roots, kidney-beans, and other seeds. M. de Bufon thinks it a mole; but by the ears, it should be classed here.

SORITES, in logic, a species of reasoning in which a great number of propositions are so linked together, that the predicate of the one becomes continually the subject of the next following, till at last a conclusion is formed by bringing together the subject of the first proposition and the predicate of the last. See *Logic*, n° 96, 97.

SORNERS, in Scots law. See *LAW*, N° cxxxvi. 30.

Sorrel

Soul

SORREL, in botany. See RUMEX.

Wood-SORREL, in botany. See OXALIS.

SORREL-Colour, in the manege, is a reddish colour, generally thought to be a sign of a good horse.

SORTILEGE, (*fortilegium*,) a species of divination performed by means of *fortes* or lots.

The *fortes Præsentine*, famous in antiquity, consisted in putting a number of letters, or even whole words, into an urn; and then, after shaking them together, they were thrown on the ground; and whatever sentences could be made out from them, constituted the answer of the oracle. Another kind of *fortes* consisted in taking some celebrated poet, as Homer or Virgil, and opening the book, whatever presented itself first to the eye made the answer: and hence it got the name of *fortes Homericae*, *fortes Virgilianæ*, &c.

The superstitious among the ancient Christians practiced a similar kind of divination, by opening the Old and New Testament; whence it got the name of *fortes sanctæ scripturæ*.

SOTERIA, in antiquity, sacrifices offered to the gods for delivering a person from danger; as also poetical pieces composed for the same purpose.

SOUBISE, a town of France, in the province of Guienne, and territory of Saintonge, with the title of a principality. It is seated on the river Charente, in W. Long. 1. o. N. Lat. 45. 54.

SOUGH, among miners, denotes a passage dug under ground, to convey off water from mines. See MINE.

SOVEREIGN, in matters of government, is applied to the supreme magistrate or magistrates of an independent government or state; by reason their authority is only bounded by the laws of God, of nature, and the fundamental laws of the state: such are kings, princes, &c.

SOVEREIGN Power, or SOVEREIGNTY, in the British polity, is the power of making laws; for wherever that power resides, all others must conform to it, and be directed by it, whatever appearance the outward form and administration of the government may put on. For it is at any time in the option of the legislature to alter that form and administration by a new edict or rule, and to put the execution of the laws into whatever hands it pleases: and all the other powers of the state must obey the legislative power in the execution of their several functions, or else the constitution is at an end. *Blackst. Com.* Vol. I. p. 49. In our constitution the law ascribes to the king the attribute of sovereignty: but that is to be understood in a qualified sense, i. e. as supreme magistrate, not as sole legislator; as the legislative power is vested in the king, lords, and commons, not in any of the three estates alone.

SOUL, a spiritual substance, which animates the bodies of living creatures; it is the principle of life and activity within them.

Various have been the opinions of philosophers concerning the substance of the human soul. The Cartesians make thinking the essence of the soul. Others again hold, that man is endowed with three kinds of souls, viz. the rational, which is purely spiritual, and infused by the immediate inspiration of God; the irrational, or sensitive, which is common to man and brutes; and lastly, the vegetative soul, or principle of growth and nutrition.

Soul

Sounding,

That the soul is an immaterial substance appears from hence, that its primary operations of willing and thinking have not only no connection with the known properties of body, but seem plainly inconsistent with some of its most essential qualities. For the mind discovers no relation between thinking and the motion and arrangement of parts.

As to the immortality of the human soul, the arguments to prove it may be reduced to the following heads: 1. The nature of the soul itself, its desires, sense of moral good and evil, gradual increase in knowledge and perfection, &c. 2. The moral attributes of God.

Under the former of these heads it is urged, that the soul, being an immaterial intelligent substance, does not depend on the body for its existence; and therefore may, nay, and must, exist after the dissolution of the body, unless annihilated by the same power which gave it a being at first. This argument, especially if the infinite capacity of the soul, its strong desire after immortality, its rational activity and advancement towards perfection, be likewise considered, will appear perfectly conclusive to men of a philosophical turn; because nature, or rather the God of nature, does nothing in vain.

But arguments drawn from the latter head, viz. the moral attributes of the Deity, are not only better adapted to convince men unacquainted with abstract reasoning, but equally certain and conclusive with the former: for as the justice of God can never suffer the wicked to escape unpunished, nor the good to remain always unrewarded; therefore, arguments drawn from the manifest and constant prosperity of the wicked, and the frequent unhappiness of good men in this life, must convince every thinking person, that there is a future state wherein all will be set right, and God's attributes of wisdom, justice, and goodness, fully vindicated. We shall only add, that had the virtuous and conscientious part of mankind no hopes of a future state, they would be of all men most miserable: but as this is absolutely inconsistent with the moral character of the Deity, the certainty of such a state is clear to a demonstration. See MORAL Philosophy, n° 228—238.

SOUL of Brutes. See BRUTES.

SOUND, a simple perception or idea, communicated to the soul by means of the ear, which is the primary organ of hearing. See ACOUSTICS.

SOUND, in geography, denotes in general any strait or inlet of the sea between two head-lands. However, the name *sound* is given by way of eminence, to the strait between Sweden and Denmark, joining the German ocean to the Baltic, being about four miles over. See DENMARK, n° 24.

SOUNDING, the operation of trying the depth of the water, and the quality of the ground, by means of a plummet sunk from a ship to the bottom.

There are two plummets used for this purpose in navigation; one of which is called the *hand-lead*, weighing about eight or nine pounds; and the other the *deep sea-lead*, which weighs from 25 to 30 pounds; and both are shaped like the frustum of a cone or pyramid. The former is used in shallow waters, and the latter at a great distance from the shore; particularly

ON

four,
south

on approaching the land after a sea-voyage. Accordingly the lines employed for this purpose are called the *deep-sea lead-line*, and the *hand lead-line*.

The hand-lead line, which is usually 20 fathoms in length, is marked at every two or three fathoms; so that the depth of the water may be ascertained either in the day or night. At the depth of two and three fathoms, there are marks of black leather; at 5 fathoms, there is a white rag; at seven, a red rag; at 10, black leather; at 13, black leather; at 15, a white rag; and at 17, a red ditto.

Sounding with the hand-lead, which is called *heaving the lead* by seamen, is generally performed by a man who stands in the main-chains to windward. Having the line all ready to run out without interruption, he holds it nearly at the distance of a fathom from the plummet; and having swung the latter backwards and forwards three or four times, in order to acquire the greater velocity, he swings it round his head, and thence as far forward as is necessary; so that, by the lead's sinking whilst the ship advances, the line may be almost perpendicular when it reaches the bottom. The person sounding then proclaims the depth of the water in a kind of song resembling the cries of hawkers in a city. Thus, if the mark of five fathoms is close to the surface of the water, he calls, 'By the mark five!' and as there is no mark at four, six, eight, &c. he estimates those numbers, and calls, 'By the dip four,' &c. If he judges it to be a quarter or an half more than any particular number, he calls, 'And a quarter five! and a half four,' &c. If he conceives the depth to be three quarters more than a particular number, he calls it a quarter less than the next: thus, at four fathom and three fourths, he calls, 'A quarter less five!' and so on.

The deep sea lead is marked with two knots at 20 fathom, three at 30, four at 40, and so on to the end. It is also marked with a single knot in the middle of each interval, as at 25, 35, 45 fathoms, &c. To use this lead more effectually at sea, or in deep water on the sea-coast, it is usual previously to bring to the ship, in order to retard her course: the lead is then thrown as far as possible from the ship on the line of her drift, so that, as it sinks, the ship drives more perpendicularly over it. The pilot, feeling the lead strike the bottom, readily discovers the depth of the water by the mark on the line nearest its surface. The bottom of the lead being also well rubbed over with tallow, retains the distinguishing marks of the bottom, as shells, ooze, gravel, &c. which naturally adhere to it.

The depth of the water, and the nature of the ground, which is called the *soundings*, are carefully marked in the log-book, as well to determine the distance of the place from the shore, as to correct the observations of former pilots.

SOUR CROUT; a preparation of cabbage, very useful at sea. See *Means of Preserving the Health of SEAMEN*.

SOUR-Gourd, or *African Calabash-tree*. See **ADANSONIA** and **BAOBAB**.

SOUTH (Dr Robert), an eminent divine, was the son of Mr William South a merchant of London, and was born at Hackney near that city in 1633. He studied at Westminster school, and afterwards in Christ-church college, Oxford. In 1654 he wrote a

copy of Latin verses to congratulate Cromwell upon the peace concluded with the Dutch; and the next year a Latin poem, intitled *Musica Incantans*. In 1660 he was elected public orator of the university; and the next year became domestic chaplain to Edward earl of Clarendon, lord high chancellor of England. In 1663 he was installed prebendary of Westminster, admitted to the degree of doctor of divinity, and had a sinecure bestowed on him in Wales by his patron the earl of Clarendon; after whose retirement into France in 1667 he became chaplain to the duke of York. In 1670 he was installed canon of Christ-church in Oxford; and in 1676 attended as chaplain to Laurence Hyde, Esq; ambassador extraordinary to the king of Poland. In 1678 he was presented to the rectory of Ilip in Oxfordshire; and in 1680 rebuilt the chancel of that church, as he afterwards did the rectory-house belonging to it. After the revolution he took the oath of allegiance to king William and queen Mary, though he excused himself from accepting a great dignity in the church, vacated by the personal refusal of that oath. His health began to decline several years before his death, which happened in 1716. He was interred in Westminster Abbey, where a monument is erected to his memory. He published, 1. *Animadversion on Dr Sherlock's Vindication of the Holy and Ever Blessed Trinity*. 2. *A Defence of his Animadversions*. 3. *Sermons*, 8 vols. 8vo. And after his decease were published his *Opera Posthuma Latina*, and his posthumous English works. Dr South was remarkable for his wit, which abounds in all his writings, and particularly in his sermons; but at the same time they equally abound in ill-humour, spleen, and satire. He was remarkable for being a time-server. During the life of Cromwell he was a staunch Presbyterian, and then railed against the Independents: at the Restoration, he exerted his pulpit-eloquence against the Presbyterians; and in the reign of Queen Anne, was a warm advocate for Sacheverel.

SOUTH, one of the four cardinal points from which the winds blow. See **NAVIGATION** and **WIND**.

SOUTH-Sea, or *Pacific Ocean*, is that vast body of water interposed between Asia and America. It does not, however, strictly speaking, reach quite to the continent of Asia, excepting to the northward of the peninsula of Malacca; for the water interposed between the eastern coast of Africa and the peninsula just mentioned has the name of the *Indian Ocean*. The South-Sea, then, is bounded on one side by the western coast of America, through its whole extent, from the unknown regions in the north to the straits of Magellan and Terra del Fuego where it communicates with the southern part of the Atlantic. On the other side, it is bounded by the coast of Asia, from the northern promontory of Tichuski Nofs, to the peninsula of Malacca already mentioned. From thence it is bounded to the southward by the northern coasts of Borneo, Celebes, Macassar, New Guinea, New Holland, and the other islands in that quarter, which divide it from the Indian Ocean. Then, washing the eastern coast of the great island of New Holland, it communicates with that vast body of water encompassing the whole southern part of the globe, and which has the general name of the *Southern Ocean* all round. Thus does this

vast

South.

vaſt ocean occupy almoſt the ſemicircumference of the globe, extending almoſt from one pole to the other, and about the equatorial parts extending almoſt 180° in longitude, or 12,500 of our miles.

The northern parts of the Pacific Ocean are entirely deſtitute of land; not a ſingle iſland having yet been diſcovered in it from the latitude of 40° north and upwards, excepting ſuch as are very near the coaſts either of Aſia or America; but in the ſouthern part there are a great number, the ſituation and diſtances of which will appear from the annexed map. A geographical account of theſe iſlands, together with the manners and cuſtoms of the inhabitants, is given under the different articles as they occur in the alphabetical order; and the plate ſhows their figure and drefſes better than could be expreſſed by any verbal deſcription.

Till very lately the South-Sea was in a great meaſure unknown. From the great extent of ice which covers the ſouthern part of the globe, it was imagined that much more land exiſted there than in the northern regions: but that this could not be juſtly inferred merely from that circumſtance, is plain from what has been advanced under the article AMERICA, ° 3—24; and the ſouthern continent, long known by the name of TERRA AUSTRALIS, has eluded the ſearch of the moſt expert navigators ſent out from Britain and France by royal authority.

The firſt of theſe voyages was made by commodore now admiral Byron, in the Dolphin, a man of war of the ſixth rate, accompanied by the Tamar frigate, captain Mout. He ſailed from Plymouth the 21ſt of July 1764; and paſſing through the ſtraits of Magellan, diſcovered ſeveral iſlands in the ſouthern hemisphere. He then proceeded to the Ladrone iſlands; reſreſhed his crew at Tinian, which is one of them; proceeded to Batavia; and, returning to Europe by the Cape of Good Hope, caſt anchor in Plymouth Sound the 9th of M y 1766. In the Auguſt following, captain Wallis, in the Dolphin, ſailed on a ſecond circumnavigation of the globe, accompanied by captain Carteret in the Swallow ſloop. Having paſſed the ſtraits of Magellan, the two ſhips parted company. Captain Wallis directed his courſe more weſtwardly than any former navigator within the tropics; he diſcovered ſeveral iſlands, but particularly O-Taheitee, which he named *King George's Iſland*. Captain Carteret, beſides ſeveral iſlands, diſcovered the ſtraits which divide New Britain from what is now called *New Ireland*. Captain Wallis returned to England by the Eaſt Indies in May 1768, and captain Carteret by the ſame route in March 1769. In November 1766, commodore Bougainville ſailed from France with a frigate and a ſtore-ſhip: he entered the Pacific Ocean by the Straits of Magellan; touched at O-Taheitee, the northern part of Tiera del Eſperitu Santo; reſreſhed his crews in the very port which captain Carteret had not long left in New Ireland, touched at Batavia ſoon after the Swallow's departure from thence, ſell into company with that ſloop after leaving the Cape of Good Hope, and returned to France much about the ſame time. In 1766, the Royal Society preferred a memorial to his majeſty, repreſenting the advantages that would be derived to ſcience, if an accurate obſervation of the tranſit of Venus over the ſun, which was to happen in June 1769, was taken in ſome part

of the South-Sea; in conſequence of which, orders Southamp-
ton. were given for the Endeavour bark, of 370 tons, to be fitted out for that purpoſe, the command of which was given to lieutenant James Cook. This gentleman, and Mr Charles Green, were appointed by that learned body to make obſervations on the tranſit. Mr Banks, a gentleman of large fortune, and zealouſly devoted to the acquiſition of knowledge, accompanied by Dr Solander, a learned diſciple of the great Linnæus, embarked on this expedition; and captain Wallis returning juſt as they were about to ſail, the iſland of O-Taheitee, which he had diſcovered, was pointed out as the moſt eligible ſpot for the purpoſe of making the obſervation. Lieutenant Cook ſailed in July 1768, and went round Cape Horn. With indefatigable zeal he traſverſed the ſouthern regions of the great Pacific Ocean, and minutely examined the coaſt of New Zealand: With undaunted courage he perſevered amidſt rocks and ſhoals in tracing the eaſtern coaſt of New Holland; and having found it to be ſeparated from New Guinea by a ſtrait, he returned to England by the way of the Eaſt Indies, and came to an anchor in the Downs on the 12th of July 1771. Soon after the return of the Endeavour, a voyage to determine, with precision, the exiſtence of a ſouthern continent, was reſolved upon under the ſame royal auſpices which had given birth to the former expeditions. Two veſſels, the Reſolution and Adventure, were fitted out as king's ſhips for that purpoſe: captain Cook had the conduct of the expedition, and had the Reſolution for his ſhip; captain Furneaux, who had already ſailed round the world with captain Wallis as his firſt lieutenant, had the command of the Adventure. Dr Forſter, and his ſon Mr George Forſter, were appointed to embark in this expedition, to collect, deſcribe, and draw the objects of natural hiſtory which ſhould preſent themſelves; Mr Wales was appointed astronomer on board the Reſolution, and Mr William Bayley on board the Adventure; alſo Mr William Hodges, a very able artiſt, whoſe department it was to take drawings of perſons and proſpects that were curious and important. On the 13th of July 1772, the two ſhips ſailed on their voyage round the world, than which none was ever more productive of valuable information, or more beneficial to the advancement of ſcience. The Adventure having twice parted company from the Reſolution, returned to England in 1774; but the Reſolution did not arrive till the 3d July 1775. Neither ſhip touched at any of the Eaſt India ſettlements. In 1776 Captain Cook was once more ſent out to explore the Pacific Ocean; but was ordered to direct his chief attention to the northern part, eſpecially where the continents of Aſia and America approach each other. This taſk he executed with the ſame intrepidity and ſucceſs which have all along diſtinguiſhed him from other navigators: but his unfortunate death, and that of Capt. Clerk who ſucceeded him, have undoubtedly rendered that voyage much leſs uſeful to ſcience than otherwiſe it would have been; and no authentic account of the diſcoveries actually yet made has appeared.

SOUTHAMPTON, a ſea-port town of Hampſhire in England. It is commodiouſly ſeated on an arm of the ſea; is a place of good trade, and well inhabited. It is ſurrounded by walls and ſeveral watch-towers,

towers, and had a strong castle to defend the harbour, now in ruins. It is a corporation and a county of itself, with the title of an earldom, and sends two members to parliament. W. Long. 1. 30. N. Lat. 50. 55.

SOUTHERN (Thomas), an eminent dramatic writer, was born at Dublin in 1660, and received his education in the university there. He came young to London to study law; but instead of that devoted himself to poetry and writing of plays. His Persian Prince, or Loyal Brother, was introduced in 1682, when the Tory interest was triumphant in England; and the character of the loyal brother being intended to compliment James duke of York, he rewarded the author when he came to the throne with a commission in the army. On the Revolution taking place, he retired to his studies, and wrote several plays, from which he is supposed to have derived a very handsome subsistence, being the first who raised the advantage of play-writing to a second and third night. The most finished of all his plays is Oroonoko, or The Royal Slave, which is built on a true story related in one of Mrs Behn's novels. Mr Southern died in 1746, in the 86th year of his age; the latter part of which he spent in a peaceful serenity, having, by his commission as a soldier, and the profits of his dramatic works, acquired a handsome fortune; and being an exact economist, he improved what fortune he gained to the best advantage. He enjoyed the longest life of all our poets; and died the richest of them, a very few excepted. His plays are printed in two volumes 12mo.

SOUTHERN Continent. See **SOUTH Sea**, and **TERRA Australis**.

SOUTHERNWOOD, in botany. See **ARTEMISIA**.

SOUTHWARK, a town of Surry, part of which now belongs to the city of London, and the whole is reckoned a suburb thereto, though it sends two members to parliament on its own account. The principal street runs from London-bridge to St. George's church; besides which there are three others, and two famous hospitals, namely, St Thomas's and Guy's, which are seated in that part called the *Borough*. There are also two prisons for debt, the King's Bench and the Marshalsea; and one for criminals, called the *New Gaol*. The famous bridge which joins Southwark to London is now greatly altered, the houses being taken down, which rendered the passage over it very inconvenient.

SOW, in zoology. See **SUS**.

Sow, in the iron works, the name of the block or lump of metal they work at once in the iron furnace.

SOWING, in agriculture and gardening, the depositing any kind of seed in the earth in order for a future crop. See **AGRICULTURE**.

Drill-Sowing See **DRILL-Sowing**.

SOY. See **DOLICHOS**.

SPA, or **SPAW**, a town of Germany, in the circle of Westphalia, and in the bishopric of Liege. It contains about 300 houses, and is famous for its mineral waters known all over Europe. The inhabitants are very civil to strangers, and ready to do them all manner of good offices, but must be paid for their labour. It is seated in a valley, surrounded with mountains. That called the *Old Spaw* consists of miserable cottages, and is properly nothing but the suburb to the other. The inhabitants send out swarms of chil-

dren when strangers arrive, to get what they can by begging. The houses of the New Spaw are all wood, old-fashioned, dark, and small; and yet it is affirmed they can make 1200 beds for strangers. The church of the capuchins, and the parish church, are both seated upon eminences, and look very well at a distance. The inn, called the *Court of London*, is very large, the best in the place, and most frequented. The names of the five principal wells are, *Poubon, Geronstorf, Saviniere, Watpotz, and Tunnelt*. The inhabitants are employed in making toys and other little things for strangers. Near it there are excellent fish and good game. It is 17 miles S. E. of Liege. E. Lon. 5. 50. N. Lat. 50. 32.

SPACE is defined by Mr Locke to be a simple idea, which we attain both by our sight and touch; the modes whereof are distance, capacity, extension, duration, &c. See **METAPHYSICS**, n° 56, 58.

SPACE, in geometry, denotes the area of any figure, or that which fills the interval or distance between the lines that terminate it.

SPADIX, in botany, anciently signified the receptacle of the palms. It is now used to express every flower-stalk that is protruded out of a spathe or sheath.

The spadix of the palms is branched; that of all other plants, simple. This last case admits of some variety; in calla, dracontium and pothos, the florets cover it on all sides; in arum, they are disposed on the lower part only; and in zosteria, on one side.

SPAGIRIC ART, a name given by authors to that species of chemistry which works on metals, and is employed in the search of the philosopher's stone.

SPAHIS, horsemen in the Ottoman army, chiefly raised in Asia. The great strength of the grand seignior's army consists in the janissaries, who are the foot; and the spahis, who are the horse.

SPAIN, a country of Europe, famous both in ancient and modern history, situated in that large peninsula which forms the south-western part of Europe. It is bounded on the south and east by the Mediterranean sea and straits of Gibraltar, on the north and west by the bay of Biscay and Atlantic Ocean, on the south-west by Portugal, and on the north-east by the Pyrenees.

The most ancient name of Spain was *Iberia*, supposed by some to be derived from the Iberians, a people inhabiting Mount Caucasus, a colony of whom settled in this country. Others derive it from the Phenician word *Ebra* or *Ibra*, signifying a passage or limit. By the Romans it was called *Spania* or *Hispania*, by the Phenician name *Sphanija*; and this again from *shaphan*, a Phenician word signifying a rabbit, because the western part of Spain abounded with those animals.

Spain, as well as the rest of Europe, was probably peopled by the Celtes; but the Spanish historians derive the origin of their nation from Tubal the fifth son of Japhet, asserting that Spain had been a monarchy for 2226 years before the coming of the Celtes into it. Till the coming of the Carthaginians into Spain, however, nothing certain can be affirmed of the Spaniards; and this happened not long before the commencement of the first Punic war. Their success in reducing the country, and their final expulsion.

thaginians
in Spain.

Spain.

fion by the Romans, has already been related under the articles **ROME** and **CARTHAGE**; we have here therefore only to take notice of the state of Spain under the Roman government, until the Romans were in their turn expelled by the northern barbarians.

³
Exceeding
great riches
of the
country.

At the time of the Roman conquest, Spain, though prodigious quantities of silver had been carried out of it by the Carthaginians and Tyrians, was yet a very rich country. In the most ancient times, indeed, its riches are said to have exceeded what is related of the most wealthy country in America. Aristotle assures us, that when the Phenicians first arrived in Spain, they exchanged their naval commodities for such immense quantities of silver, that their ships could neither contain nor sustain its load, though they used it for ballast, and made their anchors and other implements of silver. When the Carthaginians first came to Spain, they found the quantity of silver nothing lessened; since the inhabitants at that time made all their utensils, and even managers, of that precious metal. In the time of the Romans this amazing plenty was very much diminished; however, their gleanings were by no means despicable, since, in the space of nine years, they carried off 111,542 pounds of silver, and 4095 of gold, besides an immense quantity of coin and other things of value. The Spaniards were always remarkable for their bravery, and some of Hannibal's best troops were brought from thence. But as the Romans penetrated farther into the country than the Carthaginians had done, they met with nations whose love of liberty was equal to their valour, and whom the whole strength of their empire was scarce able to subdue. Of these the most formidable were the Numantines, Castabrians, and Alurians.

³
Virithus
opposes the
Roman
power with
success.

In the time of the third Punic war, one Virithus, a celebrated hunter, and afterwards the captain of a gang of banditti, took upon him the command of some nations who had been in alliance with Carthage, and ventured to oppose the Roman power in that part of Spain called *Lusitania*, now Portugal. The prætor, named *Vetilius*, who commanded in those parts, marched against him with 10,000 men; but was defeated and killed, with the loss of 4000 of his troops. The Romans immediately dispatched another prætor with 10,000 foot and 1300 horse: but Virithus having first cut off a detachment of 4000 of them, engaged the rest in a pitched battle; and having entirely defeated them, reduced great part of the country. Another prætor, who was sent with a new army, met with the same fate; so that, after the destruction of Carthage, the Romans thought proper to send a consul named *Quintus Fabius*, who defeated the Lusitanians in several battles, and regained two important places which had long been in the hands of the rebels. After the expiration of Fabius's consulship, Virithus continued the war with his usual success, till the senate thought proper to send against him the consul *Q. Cæcilius Metellus*, an officer of great valour and experience. With him Virithus did not choose to venture a pitched battle, but contented himself with acting on the defensive; in consequence of which the Romans recovered a great many cities, and the whole of Tarraconian Spain was obliged to submit to their yoke. The other consul, named *Servilius*, met with quite different success; being entirely defeated, and having his camp in great danger of being taken

⁵
Is reduced
to great
straits by
Metellus.

by Virithus. Notwithstanding all the success of Metellus, however, he could not withstand the intrigues of his countrymen against him, and he was not allowed to finish the war he had begun with so much success. In resentment for this he took all imaginable pains to weaken the army under his command; he disbanded the flower of his troops, exhausted the magazines, let the elephants die, broke in pieces the arrows which had been provided for the Cretan archers, and threw them into a river. Yet, after all, the army which he gave up to his successor *Q. Pompeius*, consisting of 30,000 foot and 2000 horse, was sufficient to have crushed Virithus if the general had known how to use it. But, instead of opposing Virithus with success, the imprudent consul procured much more formidable

Spain.

⁶
War between
the Romans
and Numantians;

enemies. The Termantians and Numantians, who had hitherto kept themselves independent, offered very advantageous terms of peace and alliance with Rome; but Pompeius insisted on their delivering up their arms. Upon this, war was immediately commenced. The consul with great confidence invellied Numantia; but being repulsed with considerable loss, he sat down before Termantia, where he was attended with still worse success. The very first day, the Termantines killed 700 of his legionaries; took a great convoy which was coming to the Roman camp; and having defeated a considerable body of their horse, pushed them from post to post till they came to the edge of a precipice, where they all tumbled down, and were dashed to pieces. In the mean time Servilius, who had been continued in his command with the title of *proconsul*, managed matters so ill, that Virithus surrounded him on all sides, and obliged him to sue for peace. The terms offered to the Romans were very moderate; being only that Virithus should keep the country he at that time possessed, and the Romans Virithus remain masters of all the rest. This peace the proconsul was very glad to sign, and afterwards got it signed by the senate and people of Rome.

The next year *Q. Pompeius* was continued in his command against the Numantines in Farther Spain, while *Q. Servilius Cæpio*, the new consul, had for his province Hither Spain, where Virithus had established his new state. Pompeius undertook to reduce Numantia by turning aside the stream of the *Durius*, now the *Douro*, by which it was supplied with water; but, in attempting this, such numbers of his men were cut off, that, finding himself unable to contend with the enemy, he was glad to make peace with them on much worse terms than they had offered of their own accord. The peace, however, was ratified at Rome; but in the mean time Cæpio, desirous of showing his prowess against the renowned Virithus, prevailed upon the Romans to declare war against him without any provocation. As Cæpio commanded an army greatly superior to the Lusitanians, Virithus thought proper to sue for peace; but finding that Cæpio would be satisfied with nothing less than a surrender at discretion, he resolved to stand his ground. But in the mean time, the latter having bribed some of the intimate companions of Virithus to murder him in his sleep, he by that infamous method put an end to a war which Virithus lasted fourteen years, very little to the honour of the

⁷
treacherously murdered.

The Romans
defeated by
the Numantines.

After the death of Viriathus, the Romans with like treachery ordered their new consul Popilius to break the treaty with the Numantines. His infamous conduct met with the reward it deserved; the Numantines, falling out, put the whole Roman army to flight with such slaughter, that they were in no condition to act during the whole campaign. Mancinus, who succeeded Popilius, met with still worse success; his great army, consisting of 30,000 men, was utterly defeated by 4000 Numantines, and 20,000 of them killed in the pursuit. The remaining 10,000, with their general, were pent up by the Numantines in such a manner that they could neither advance nor retreat, and would certainly have been all put to the sword or made prisoners, had not the Numantines, with a generosity which their enemies never possessed, offered to let them depart upon condition that a treaty was concluded with them upon very moderate terms. This the consul very willingly promised, but found himself unable to perform. On the contrary, the people, not satisfied with declaring his treaty null and void, ordered him to be delivered up to the Numantines. The latter refused to accept him, unless he had along with him the 10,000 men whom they had relieved as above related. At last, after the consul had remained a whole day before the city, his successor Furius, thinking this a sufficient recompence to the Numantines for breaking the treaty, ordered him to be received again into the camp. However, Furius did not choose to engage with such a desperate and resolute enemy as the Numantines had showed themselves; and the war with them was discontinued till the year 133 B. C. when Scipio Emilianus, the destroyer of Carthage, was sent against them. Against this renowned commander the Numantines with all their valour were not able to cope. Scipio, having with the utmost care introduced strict discipline among his troops, and reformed the abuses which his predecessors had suffered in their armies, by degrees brought the Romans to face their enemies, which at his arrival they had absolutely refused to do. Having then ravaged all the country round about the town, it was soon blocked up on all sides, and the inhabitants began to feel the want of provisions. At last they resolved to make one desperate attempt for their liberty, and either to break through their enemies, or perish in the attempt. With this view they marched out in good order by two gates, and fell upon the works of the Romans with the utmost fury. The Romans, unable to stand this desperate shock, were on the point of yielding; but Scipio, hastening to the places attacked, with no fewer than 20,000 men, the unhappy Numantines were at last driven into the city, where they sustained for a little longer the miseries of famine. Finding at last, however, that it was altogether impossible to hold out, it was resolved by the majority to submit to the pleasure of the Roman commander. But this resolution was not universally approved. Many shut themselves up in their houses, and died of hunger, while even those who had agreed to surrender repented their offer, and setting fire to their houses, perished in the flames with their wives and children, so that not a single Numantine was left alive to grace the triumph of the conqueror of Carthage.

10
Miserable
end of the
people.

After the destruction of Numantia the whole of Spain submitted to the Roman yoke; and nothing remarkable happened till the times of the Cimbric, when a prætorian army was cut off in Spain by the Lusitanians. From this time nothing remarkable occurs in the history of Spain till the civil war between Marius and Sylla. The latter having crushed the Marian faction, as related under the article ROME, proscribed all those that had sided against him whom he could not immediately destroy. Among these was Sertorius, a man of consummate valour and experience in war. He had by Marius been appointed prætor of Spain; and, upon the overthrow of Marius, retired to that province. Sylla no sooner heard of his arrival in that country, than he sent thither one Caius Annius with a powerful army to drive him out. As Sertorius had but few troops along with him, he dispatched one Julius Salinator with a body of 6000 men to guard the passes of the Pyrenees, and prevent Annius from entering the country. But Salinator having been treacherously murdered by assassins hired by Annius for that purpose, he no longer met with any obstacle; and Sertorius was obliged to embark for the coast of Africa with 3000 men, being all he had now remaining. With these he landed in Mauritania; but as his men were dragging carelessly about, great numbers of them were cut off by the Barbarians. This new misfortune obliged Sertorius to re-embark for Spain; but finding the whole coast lined with the troops of Annius, he put to sea again, not knowing what course to steer. In this new voyage he met with a small fleet of Cilician pirates; and having prevailed with them to join him, he made a descent on the coast of Yvea, overpowered the garrison left there by Annius, and gained a considerable booty. On the news of this victory Annius set sail for Yvea, with a considerable squadron, having 5000 land-forces on board. Sertorius, not intimidated by the superiority of the enemy, prepared to give them battle. But a violent storm arising, most of the ships were driven on shore and dashed to pieces, Sertorius himself with great difficulty escaping with the small remains of his fleet. For some time he continued in great danger, being prevented from putting to sea by the fury of the waves, and from landing by the enemy; at last, the storm abating, he passed the straits of Gades, now Gibraltar, and landed near the mouth of the river Bæotis. Here he met with some seamen newly arrived from the Atlantic, or Fortunate Islands; and was so taken with the account they gave him of those happy regions, that he resolved to retire thither to spend the rest of his life in quiet and happiness. But having communicated this design to the Cilician pirates, they immediately abandoned him, and set sail for Africa, with an intention to assist one of the barbarous kings against his subjects who had rebelled. Upon this Sertorius sailed thither also, but took the opposite side; and having defeated the king named *Afcalis*, obliged him to shut himself up in a successful city of Tingis, now Tangier, which he closely besieged. But in the mean time Pacianus, who had been country-folk sent by Sylla to assist the king, advanced with a considerable army against Sertorius. Upon this the latter, leaving part of his forces before the city, marched with the rest to meet Pacianus, whose army, though greatly superior to his own in number, he entirely defeated; killed

killed the general, and took all his forces prisoners.—The fame of this victory soon reached Spain; and the Lusitanians, being threatened with a new war from Annus, invited Sertorius to head their armies. With this request he very readily complied, and soon became very formidable to the Romans. Titus Didius, governor of that part of Spain called *Bætica*, first entered the lists with him; but he being defeated, Sylla next dispatched Metellus, reckoned one of the best commanders in Rome, to stop the progress of this new enemy. But Metellus, notwithstanding all his experience, knew not how to act against Sertorius, who was continually changing his station, putting his army into new forms, and contriving new stratagems. On his first arrival he sent for L. Domitius, then prætor of Hither Spain, to his assistance; but Sertorius being informed of his march, detached Hirtuleius, or Herculeius, his quaestor, against him, who gave him a total overthrow. Metellus then dispatched Lucius Lolius prætor of Narbonne Gaul against Hirtuleius; but he met with no better success, being utterly defeated, and his lieutenant-general killed.

15
Erects Lu-
stania into
a republic.

The fame of these victories brought to the camp of Sertorius such a number of illustrious Roman citizens of the Marian faction, that he formed a design of erecting Lusitania into a republic, in opposition to that of Rome. Sylla was continually sending fresh supplies to Metellus; but Sertorius with an handful of men, accustomed to range about the mountains, to endure hunger and thirst, and live exposed to the inclemencies of the weather, so harassed the Roman army, that Metellus himself began to be quite discouraged. At last, Sertorius, hearing that Metellus had spoken disrespectfully of his courage, challenged his antagonist to end the war by single combat; however, Metellus very prudently declined the combat, as being advanced in years; yet this refusal brought upon him the contempt of the unthinking multitude, upon which Metellus resolved to retrieve his reputation by some signal exploit, and therefore laid siege to Lacobriga, a considerable city in those parts. This he hoped to reduce in two days, as there was but one well in the place; but Sertorius, having previously removed all those who could be of no service during the siege, and conveyed 6000 skins full of water into the city, Metellus continued a long time before it without making any impression. At last, his provisions being almost spent, he sent out Aquinus at the head of 6000 men to procure a new supply; but Sertorius falling unexpectedly upon them, cut in pieces or took the whole detachment; the commander himself being the only man who escaped to carry the news of the disaster; upon which Metellus was obliged to raise the siege with disgrace.

17
Civilizes the
Lusitanians

And now Sertorius, having gained some intervals of ease in consequence of the many advantages he had obtained over the Romans, began to civilize his new subjects. Their savage and furious manner of fighting he changed for the regular order and discipline of a well-formed army; he bestowed liberally upon them gold and silver to adorn their arms, and by conversing familiarly with them, prevailed upon them to lay aside their own dress for the Roman *toga*. He sent for all the children of the principal people, and placed them in the great city of Osca, now Huesca, in the king-

Spain.

dom of Arragon, where he appointed them masters to instruct them in the Roman and Greek learning, that they might, as he pretended, be capable of sharing with him the government of the republic. Thus he made them really hostages for the good behaviour of their parents; however, the latter were greatly pleased with the care he took of their children, and all Lusitania were in the highest degree attached to their new sovereign. This attachment he took care to heighten by the power of superstition; for having procured a young hind of a milk-white colour, he made it so tame that it followed him wherever he went; and Sertorius gave out to the ignorant multitude, that this hind was inspired by Diana, and revealed to him the designs of his enemies, of which he always took care to be well informed by the great numbers of spies he employed.

While Sertorius was thus employed in establishing his authority, the republic of Rome, alarmed at his success, resolved to crush him at all events. Sylla was now dead, and all the eminent generals in Rome solicited this honourable though dangerous employment. After much debate a decree was passed in favour of Pompey the Great, but without recalling Metellus. But in the mean time, the troops of one Perperna, or Perperna, had, in spite of all that their general could do, abandoned him and taken the oath of allegiance to Sertorius. This was a most signal advantage to Sertorius; for Perperna commanded an army of 33,000 men, and had come into Spain with a design to settle there as Sertorius had done; but as he was defended from one of the first families in Rome, he thought it below his dignity to serve under any general, however eminent he might be. But the troops of Perperna were of a different opinion; and therefore declaring that they would serve none but a general who could defend himself, they to a man joined Sertorius; upon which Perperna himself, finding he could do no better, consented to serve also as a subaltern.

On the arrival of Pompey in Spain, several of the cities which had hitherto continued faithful to Sertorius, began to waver; upon which the latter resolved by some signal exploit, to convince them that Pompey could no more screen them from his resentment than Metellus. With this view he laid siege to Lauron, now Liria, a place of considerable strength. Pompey, not doubting but he should be able to raise the siege, marched quite up to the enemy's lines, and found means to inform the garrison that those who besieged them were themselves besieged, and would soon be obliged to retire with loss and disgrace. On hearing this message, "I will teach Sylla's disciple," said Sertorius, "that it is the duty of a general to look behind as well as before him." Having thus spoken, he sent orders to a detachment of 6000 men, who lay concealed among the mountains, to come down and fall upon his rear if he should offer to force the lines. Pompey, surprised at their sudden appearance, durst not stir out of his camp; and in the mean time the besieged, despairing of relief, surrendered at discretion; upon which Sertorius granted them their lives and liberty, but reduced their city to ashes.

While Sertorius was thus successfully contending with Pompey, his quaestor Hirtuleius was entirely defeated by Metellus, with the loss of 20,000 men; upon which Sertorius advanced with the utmost expedition

to the banks of the Suero in Tarraconian Spain, with a design to attack Pompey before he could be joined by Metellus. Pompey, on his part, did not decline the combat; but, fearing that Metellus might share the glory of the victory, advanced with the greatest expedition. Sertorius put off the battle till towards the evening; Pompey, tho' he knew that the night would prove disadvantageous to him, whether vanquished or victorious, because his troops were unacquainted with the country, resolved to venture an engagement, especially as he feared that Metellus might arrive in the mean time, and rob him of part of the glory of conquering so great a commander. Pompey, who commanded his own right wing, soon obliged Perperna, who commanded Sertorius's left, to give way. Hereupon Sertorius himself, taking upon him the command of that wing, brought back the fugitives to the charge, and obliged Pompey to fly in his turn. In his flight he was overtaken by a gigantic African, who had already lifted up his hand to discharge a blow at him with his broadsword; but Pompey prevented him by cutting off his right hand at one blow. As he still continued his flight, he was wounded and thrown from his horse; so that he would certainly have been taken prisoner, had not the Africans who pursued him quarrelled about the rich furniture of his horse. This gave an opportunity to the general to make his escape; so that at length he reached his camp with much difficulty. But in the mean time Afranius, who commanded the left wing of the Roman army, had entirely defeated the wing which Sertorius had left, and even pursued them so close that he entered the camp along with them. Sertorius, returning suddenly, found the Romans busy in plundering the tents; when, taking advantage of their situation, he drove them out with great slaughter, and retook his camp. Next day he offered battle a second time to Pompey; but Metellus then coming up with all his forces, he thought proper to decline an engagement with both commanders. In a few days, however, Pompey and Metellus agreed to attack the camp of Sertorius. Metellus attacked Perperna, and Pompey fell upon Sertorius. The event was similar to that of the former battle; Metellus defeated Perperna, and Sertorius routed Pompey. Being then informed of Perperna's misfortune, he hastened to his relief; rallied the fugitives, and repulsed Metellus in his turn, wounded him with his lance, and would certainly have killed him, had not the Romans, ashamed to leave their general in distress, hastened to his assistance, and renewed the fight with great fury. At last Sertorius was obliged to quit the field, and retire to the mountains. Pompey and Metellus hastened to besiege him; but while they were forming their camp, Sertorius broke through their lines, and escaped into Lusitania. Here he soon raised such a powerful army, that the Roman generals, with their united forces, did not think proper to venture an engagement with him. They could not, however, resist the perpetual attacks of Sertorius, who now drove them from place to place, till he obliged them to separate, one into Gaul, and the other to the foot of the Pyrenees.

23
Pompey and Metellus driven out of Spain by Sertorius.

Thus did this celebrated commander triumph over all the power of the Romans; and there is little doubt that he would have continued to make head against all

the other generals whom the republic could have sent; but, by the infamous treachery of Perperna, Sertorius was assassinated at an entertainment, in 73 B. C. after he had made head against the Roman forces for almost twenty years. Pompey was no sooner informed of his death, than, without waiting for any new succours, he marched against the traitor, whom he easily defeated and took prisoner; and having caused him to be executed, thus put an end, with very little glory, to a most dangerous war.

Many of the Spanish nations, however, still continued to bear the Roman yoke with great impatience; and as the civil wars which took place first between Julius Cæsar and Pompey, and afterwards between Octavianus and Anthony, diverted the attention of the republic from Spain, by the time that Augustus had become sole master of the Roman empire, they were again in a condition to assert their liberty. The CAN TABRIANS and ASTURIANS were the most powerful and valiant nations at that time in Spain; but, after incredible efforts, they were obliged to lay down their arms, or rather were almost exterminated, by Agrippa, as is related under these articles. From this time the Spaniards continued in quiet subjection to the Romans; but on the decline of the empire they were attacked by the northern nations, who put an end to the Roman name in the west. As the inhabitants had by that time entirely lost their ancient valour, the barbarians met with no resistance but from one another. In the reign of the emperor Honorius, the Vandals, Alans, and Suevians, entered this country; and having made themselves masters of it, divided the provinces among themselves. In 444, the Romans made one effort more to recover their power in this part of the world; but being utterly defeated by the Suevians, the latter established a kingdom there which lasted till the year 584, when it was utterly overthrown by the Visigoths under Leovigilde. The Gothic princes continued to reign over a considerable part of Spain till the beginning of the eighth century, when their empire was entirely overthrown by the Saracens. During this period, they had entirely expelled the eastern emperors from what they possessed in Spain, and even made considerable conquests in Barbary; but towards the end of the seventh century the Saracens over-ran all that part of the world with a rapidity which nothing could resist; and having soon possessed themselves of the Gothic dominions in Barbary, they made a descent upon Spain about the year 711 or 712. The king of the Goths at that time was called Roderic, and by his bad conduct had occasioned great dissatisfaction among his subjects. He therefore determined to put all to the issue of a battle, knowing that he could not depend upon the fidelity of his own people if he allowed the enemy time to tamper with them. The two armies met in a plain near Xeres in Andalusia. The Goths began the attack with great fury; but though they fought like men in despair, they were at last defeated with excessive slaughter, and their king himself was supposed to have perished in the battle, being never more heard of.

By this battle the Moors in a short time rendered themselves masters of almost all Spain. The poor remains of the Goths were obliged to retire into the mountainous parts of Asturias, Burgos, and Biscay:

the inhabitants of Arragon, Catalonia, and Navarre, though they might have made a considerable stand against the enemy, chose for the most part to retire into France. In 718, however, the power of the Goths began again to revive under Don Pelagio or Pelayo, a prince of the royal blood, who headed those that had retired to the mountains after the fatal battle of Xeres. The place where he first laid the foundation of his government was in the Asturias, in the province of Liebana, about nine leagues in length and four in breadth. This is the most inland part of the country, full of mountains enormously high, and so much fortified by nature, that its inhabitants are capable of resisting almost any number of invaders. Alakor the Saracen governor was no sooner informed of this revival of the Gothic kingdom, than he sent a powerful army, under the command of one Alchaman, to crush Don Pelagio before he had time to establish his power. The king, though his forces were sufficiently numerous, (every one of his subjects arrived at man's estate being a soldier), did not think proper to venture a general engagement in the open field; but taking post with part of them himself in a cavern in a very high mountain, he concealed the rest among precipices, giving orders to them to fall upon the enemy as soon as they should perceive him attacked by them. These orders were punctually executed, tho' indeed Don Pelagio himself had repulsed his enemies, but not without a miracle, as the Spanish historians pretend. The slaughter was dreadful; for the troops who lay in ambuscade joining the rest, and rolling down huge stones from the mountains upon the Moors, (the name by which the Saracens were known in Spain, no fewer than 124,000 of these unhappy people perished in one day. The remainder fled till they were stopped by a river, and beginning to coast it, part of a mountain suddenly fell down, stopped up the channel of the river, and either crushed or drowned, by the sudden rising of the water, almost every one of that vast army.

30
Another
army cut in
pieces or
taken.

The Moors were not so much disheartened by this disaster but that they made a second attempt against Don Pelagio. Their success, however, was as bad as ever, the greatest part of their army being cut in pieces or taken; in consequence of which, they lost all the Asturias, and never dared to enter the hills with Pelagio afterwards. Indeed, their bad success had in a great measure taken from them the desire of conquering a country where little or nothing was to be got; and therefore they rather directed their force against France, where they hoped for more plunder. Into this country they poured in prodigious multitudes; but were utterly defeated, in 732, by Charles Martel, with the loss of 300,000 men, as the historians of those times pretend.

31
The Saracens utterly
defeated by
Charles
Martel.

Don Pelagio died in 737, and soon after his death such intestine divisions broke out among the Moors, as greatly favoured the increase of the Christian power. In 745 Don Alonso the Catholic, son-in-law to Pelagio, in conjunction with his brother Froila, passed the mountains, and fell upon the northern part of Galicia; and meeting with little resistance, he recovered almost the whole of that province in a single campaign. Next year he invaded the plains of Leon and Castile; and before the Moors could assemble any force to oppose him, he reduced Astorgas, Leon, Saldagna, Mon-

32
Conquests
of the Chris-
tians.

tes de Oca, Amaya, Alava, and all the country at the foot of the mountains. The year following he pushed his conquests as far as the borders of Portugal, and the next campaign ravaged the country as far as Castile. Being sensible, however, that he was yet unable to defend the flat country which he had conquered, he laid the whole of it waste, obliged the Christians to retire to the mountains, and carried off all the Moors for slaves. Thus secured by a desert frontier, he met with no interruption for some years; during which time, as his kingdom advanced in strength, he allowed his subjects gradually to occupy part of the flat country, and to rebuild Leon and Astorgas, which he had demolished. He died in 757, and was succeeded by his son Don Froila. In his time Abdelrahman, the Khaliff's viceroy in Spain, threw off the yoke, and rendered himself independent, fixing the seat of his government at Cordova. Thus the intestine divisions among the Moors were composed; yet their success seems to have been little better than before: for, soon after, Froila encountered the Moors with such success, that 54,000 of them were killed on the spot, and their general taken prisoner. Soon after, he built the city of Oviedo, which he made the capital of his dominions, in order to be in a better condition to defend the flat country, which he now determined to people.

33
The Saracens in
Spain throw
off the yoke
of the khal-
liff.

In the year 758 the power of the Saracens received another blow by the rise of the kingdom of Navarre. This kingdom, we are told, took its origin from an accidental meeting of gentlemen, to the number of 600, at the tomb of an hermit named John, who had died among the Pyrenees. At this place, where they had met on account of the supposed sanctity of the deceased, they took occasion to converse on the cruelty of the Moors, the miseries to which the country was exposed, and the glory that would result from throwing off their yoke; which, they supposed, might easily be done, by reason of the strength of their country. On mature deliberation, the project was approved; one Don Garcia Ximenes was appointed king, as being of illustrious birth, and looked upon as a person of great abilities. He recovered Ainsa, one of the principal towns of the country, out of the hands of the infidels, and his successor Don Garcia Inigas extended his territories as far as Biscay; however, the Moors still possessed Portugal, Murcia, Andalusia, Valencia, Granada, Tortosa, with the interior part of the country as far as the mountains of Castile and Saragossa. Their internal dissensions, which revived after the death of Abdelrahman, contributed greatly to reduce the power of the infidels in general. In 778, Charles the Great being invited by some discontented Moorish governors, entered Spain with two great armies; one passing through Catalonia, and the other through Navarre, where he pushed his conquests as far as the Ebro. On his return he was attacked and defeated by the Moors; though this did not hinder him from keeping possession of all those places he had already reduced. At this time he seems to have been master of Navarre: however, in 831, count Aznar, revolting from Pepin son to the emperor Lewis, again revived the independency of Navarre; but the sovereigns did not assume the title of kings till the time of Don Garcia, who began to reign in 857.

In the mean time, the kingdom founded by Don

Pe-

Spain.

Spain.

Pelagio, now called the kingdom of *Leon* and *Oviedo*, continued to increase rapidly in strength, and many advantages were gained over the Moors, who having two enemies to contend with, lost ground every day. In 921, however, they gained a great victory over the united forces of Navarre and Leon, by which the whole force of the Christians in Spain must have been entirely broken, had not the victors conducted their affairs so wretchedly that they suffered themselves to be almost entirely cut in pieces by the remains of the Christian army. In short, the Christians became at length so terrible to the Moors, that it is probable they could not long have kept their footing in Spain, had not a great general, named *Mohammed Ebn Amir Almanzor*, appeared, in 979, to support their sinking cause. This man was vizir to the king of Cordova, and being exceedingly provoked against the Christians on account of what his countrymen had suffered from them, made war with the most implacable fury. He took the city of Leon, murdered the inhabitants, and reduced the houses to ashes. Barcelona shared the same fate; Castile was reduced to a desert, Galicia and Portugal ravaged; and he is said to have overcome the Christians in fifty different engagements. At last, having taken and demolished the city of Compostella, and carried off in triumph the gates of the church of St James, a flux happened to break out among his troops, which the superstitious Christians supposed to be a divine judgment on account of his sacrilege. Taking it for granted, therefore, that the Moors were now entirely destitute of all heavenly aid, they fell upon them with such fury in the next engagement; that all the valour and conduct of Almanzor could not prevent a defeat. Overcome with shame and despair at this misfortune, he desired his followers to shift for themselves, while he himself retired to Medina Cœli, and put an end to his life by abstinence, in the year 998.

During this period a new Christian principality appeared in Spain, namely that of Castile, which is now distinguished into the Old and New Castile. The Old Castile was recovered long before that called the *New*. It was separated from the kingdom of Leon on one side by some little rivers; on the other it was bounded by the Asturias, Biscay, and the province of Rioja. On the south, it had the mountains of Segovia and Avila; thus lying in the middle between the Christian kingdom of Leon and Oviedo, and the Moorish kingdom of Cordova. Hence this district soon became an object of contention between the kings of Leon and those of Cordova; and as the former were generally victorious, some of the principal Castilian nobility retained their independency under the protection of the Christian kings, even when the power of the Moors was at its greatest height. In 884 we first hear of Don Rodriguez assuming the title of *count of Castile*, though it does not appear that either his territory or title were given him by the king of Leon. Nevertheless, this monarch having taken upon him to punish some of the Castilian lords as rebels, the inhabitants made a formal renunciation of their allegiance, and set up a new kind of government. The supreme power was now vested in two persons of quality, styled *judges*; however, this method did not long continue to give satisf-

faction, and the sovereignty was once more vested in a single person. By degrees Castile fell entirely under the power of the kings of Leon and Oviedo; and, in 1035, Don Sanchez bestowed it on his eldest son Don Ferdinand, with the title of *king*; and thus the territories of Castile were first firmly united to those of Leon and Oviedo, and the sovereigns were thenceforth styled *kings of Leon and Castile*.

Besides all these, another Christian kingdom was set up in Spain about the beginning of the 11th century. This was the kingdom of Arragon. The inhabitants were very brave, and lovers of liberty, so that it is probable they had in some degree maintained their independency, even when the power of the Moors was at the greatest. The history of Arragon, however, during its infancy, is much less known than that of any of the others hitherto mentioned. We are only assured, that about the year 1035, Don Sanchez, surname the *Great*, king of Navarre, erected Arragon into a kingdom in favour of his son Don Ramira, and afterwards it became very powerful. At this time, then, we may imagine the continent of Spain divided into two unequal parts by a straight line drawn from east to west, from the coasts of Valencia to a little below the mouth of the Duro. The country north of this belonged to the Christians, who, as yet, had the smallest and least valuable share, and all the rest to the Moors. In point of wealth and real power, both by land and sea, the Moors were greatly superior; however, their continual dissensions greatly weakened them, and every day facilitated the progress of the Christians. Indeed, had either of the parties been united, the other must soon have yielded; for though the Christians did not make war upon each other constantly as the Moors did, their mutual feuds were yet sufficient to have ruined them, had their adversaries made the least use of the advantages thus afforded them. But among the Moors almost every city was a kingdom; and as these petty sovereignties supported one another very indifferently, they fell a prey one after another to their enemies. In 1080, the king of Toledo was engaged in a war with the king of Seville, another Moorish potentate; which being observed by Alphonso king of Castile, he also invaded his territories; and in four years made himself master of the city of Toledo, with all the places of importance in its neighbourhood; from thenceforth making Toledo the capital of his dominions. In a short time the whole province of New Castile submitted; and Madrid, the present capital of Spain, fell into the hands of the Christians, being at that time but a small place.

The Moors were so much alarmed at these conquests, that they not only entered into a general confederacy against the Christians, but invited to their assistance Mahomet Ben Joseph the sovereign of Barbary. He accordingly came, attended by an incredible multitude; but was utterly defeated by the Christians in the desiles of the Black Mountain, or Sierra Morena, on the borders of Andalusia. This victory happened on the 16th of July 1212, and the anniversary is still celebrated at Toledo. This victory was not improved; the Christian army immediately dispersed themselves, while the Moors of Andalusia were strengthened by the remains of the African army;

yet, instead of being taught, by their past misfortunes, to unite among themselves, their dissensions became worse than ever, and the conquests of the Christians became daily more rapid. In 1236, Don Ferdinand of Castile and Leon took the celebrated city of Cordova, the residence of the first Moorish kings; at the same time that James I. of Arragon dispossessed them of the island of Majorca, and drove them out of Valencia. Two years after, Ferdinand made himself master of Murcia, and took the city of Seville; and in 1303 Ferdinand IV. reduced Gibraltar.

43
England inter-
feres in
the Spanish
affairs.

In the time of Edward III. we find England, for the first time, interfering in the affairs of Spain, on the following occasion. In the year 1284 the kingdom of Navarre had been united to that of France by the marriage of Donna Joanna queen of Navarre with Philip the Fair of France. In 1328, however, the kingdoms were again separated, though the sovereigns of Navarre were still related to those of France. In 1350, Charles, surnamed the *Wicked*, ascended the throne of Navarre, and married the daughter of John king of France. Notwithstanding this alliance, and that he himself was related to the royal family of France, he secretly entered into a negotiation with England against the French monarch, and even drew into his schemes the dauphin Charles, afterwards surnamed the *Wife*. The young prince, however, was soon after made fully sensible of the danger and folly of the connections into which he had entered; and, by way of atonement, promised to sacrifice his associates. Accordingly he invited the king of Navarre, and some of the principal nobility of the same party, to a feast at Rouen, where he betrayed them to his father. The most obnoxious were executed, and the king of Navarre was thrown into prison. In this ex-

tremitary, the party of the king of Navarre had recourse to England. The prince of Wales, surnamed the *Black Prince*, invaded France, defeated king John at Poitiers, and took him prisoner †; which unfortunate event produced the most violent disturbances in that kingdom. The dauphin, now about 19 years of age, naturally assumed the royal power during his father's captivity; but possessed neither experience nor authority sufficient to remedy the prevailing evils. In order to obtain supplies, he assembled the states of the kingdom: but that assembly, instead of supporting his administration, laid hold of the present opportunity to demand limitations of the prince's power, the punishment of past malversations, and the liberty of the king of Navarre. Marcel provost of the merchants of Paris, and first magistrate of that city, put himself at the head of the unruly populace, and pushed them to commit the most criminal outrages against the royal authority. They detained the dauphin in a kind of captivity, murdered in his presence Robert de Clermont and John de Conflans, marshals of France; threatened all the other ministers with the like fate; and when Charles, who had been obliged to temporize and dissemble, made his escape from their hands, they levied war against him, and openly rebelled. The other cities of the kingdom, in imitation of the capital, shook off the dauphin's authority, took the government into their own hands, and spread the contagion into every province.

Amidst these disorders, the king of Navarre made

his escape from prison, and presented a dangerous leader to the furious malcontents. He revived his pretensions to the crown of France: but in all his operations he acted more like a leader of banditti than one who aspired to be the head of a regular government, and who was engaged by his station to endeavour the re-establishment of order in the community. All the French, therefore, who wished to restore peace to their country, turned their eyes towards the dauphin; who, though not remarkable for his military talents, daily gained, by his prudence and vigilance, the ascendancy over his enemies. Marcel, the seditious provost of Paris, was slain in attempting to deliver that city to the king of Navarre. The capital immediately returned to its duty: the most considerable bodies of the mutinous peasants were dispersed or put to the sword; some bands of military robbers underwent the same fate; and France began once more to assume the appearance of civil government.

John was succeeded in the throne of France by his son Charles V. a prince educated in the school of adversity, and well qualified, by his prudence and experience, to repair the losses which the kingdom had sustained from the errors of his predecessors. Contrary to the practice of all the great princes of those times, who held nothing in estimation but military courage, he seems to have laid it down as a maxim, never to appear at the head of his armies; and he was the first European monarch that showed the advantage of policy and foresight over a rash and precipitate valour.

Before Charles could think of counterbalancing so great a power as England, it was necessary for him to remedy the many disorders to which his own kingdom was exposed. He accordingly turned his arms against the king of Navarre, the great disturber of France during that age; and he defeated that prince, and reduced him to terms, by the valour and conduct of Bertrand du Guesclin, one of the most accomplished captains of those times, whom Charles had the discernment to choose as the instrument of his victories. He also settled the affairs of Brittany, by acknowledging the title of Mountfort, and receiving homage for his dominions. But much was yet to do. On the conclusion of the peace of Bretigny, the many military adventurers who had followed the fortunes of Edward, being dispersed into the several provinces, and possessed of strong-holds, refused to lay down their arms, or relinquish a course of life to which they were now accustomed, and by which alone they could earn a subsistence. They associated themselves with the banditti, who were already inured to the habits of rapine and violence; and, under the name of *companies* or *companions*, became a terror to all the peaceable inhabitants. Some English and Gascon gentlemen of character were not ashamed to take the command of these ruffians, whose number amounted to near 40,000, and who bore the appearance of regular armies rather than bands of robbers. As Charles was not able by power to redress so enormous a grievance, he was led by necessity, as well as by the turn of his character, to correct it by policy; to discover some method of discharging into foreign countries this dangerous and intestine evil; and an occasion now offered.

Spain.

Algezira from the Moors, after a famous siege of two years, during which artillery are said first to have been used by the besieged, had been succeeded by his son Peter I. surnamed *the Cruel*; a prince equally perfidious, debauched, and bloody. He began his reign with the murder of his father's mistress Leonora de Guzman: his nobles fell every day the victims of his severity: he put to death his cousin and one of his natural brothers, from groundless jealousy; and he caused his queen Blanche de Bourbon, of the blood of France, to be thrown into prison, and afterwards poisoned, that he might enjoy in quiet the embraces of Mary de Padella, with whom he was violently enamoured.

Henry count of Trastamara, the king's natural brother, alarmed at the fate of his family, and dreading his own, took arms against the tyrant; but having failed in the attempt, he fled to France, where he found the minds of men much inflamed against Peter, on account of the murder of the French princes. He asked permission of Charles to enlist the *companies* in his service, and to lead them into Castile against his brother. The French king, charmed with the project, employed du Guesclin in negotiating with the leaders of these banditti. The treaty was soon concluded; and du Guesclin having completed his levies, led the army first to Avignon, where the Pope then resided, and demanded, sword in hand, absolution for his Russian soldiers, who had been excommunicated, and the sum of 200,000 livres for their subsistence. The first was readily promised him; but some difficulty being made with regard to the second, du Guesclin replied, "My fellows, I believe, may make a shift to do without your absolution, but the money is absolutely necessary." His Holiness then extorted from the inhabitants of the city and its neighbourhood the sum of 100,000 livres, and offered it to du Guesclin. "It is not my purpose," cried that generous warrior, "to oppress the innocent people. The Pope and his cardinals can spare me double the sum from their own pockets. I therefore insist, that this money be restored to the owners; and if I hear they are defrauded of it, I will myself return from the other side of the Pyrenees, and oblige you to make them restitution." The Pope found the necessity of submitting, and paid from his own treasury the sum demanded.

A body of experienced and hardy soldiers, conducted by so able a general, easily prevailed over the king of Castile, whose subjects were ready to join the enemy against their oppressor. Peter fled from his dominions, took shelter in Guienne, and craved the protection of the prince of Wales, whom his father had invested with the sovereignty of the ceded provinces, under the title of the *principality of Aquitaine*. The prince promised his assistance to the dethroned monarch; and having obtained his father's consent, he levied an army, and set out on his enterprise.

The first loss which Henry of Trastamara suffered from the interposition of the prince of Wales, was the recalling of the companies from his service; and so much reverence did they pay to the name of Edward, that great numbers of them immediately withdrew from Spain, and enlisted under his standard. Henry, however, beloved by his new subjects, and supported by the king of Arragon, was able to meet the enemy with

an army of 100,000 men, three times the number of those commanded by the Black Prince; yet du Guesclin, and all his experienced officers, advised him to delay a decisive action; so high was their opinion of the valour and conduct of the English hero! But Henry, trusting to his numbers, ventured to give Edward battle on the banks of the Ebro, between Najara and Navarrete; where the French and Spaniards were defeated, with the loss of above 20,000 men, and du Guesclin and other officers of distinction taken prisoners. All Castile submitted to the victor; Peter was restored to the throne, and Edward returned to Guienne with his usual glory; having not only overcome the greatest general of his age, but restrained the most blood-thirsty tyrant from executing vengeance on his prisoners.

This gallant warrior had soon reason to repent of his connections with a man like Peter, lost to all sense of virtue and honour. The ungrateful monster refused the stipulated pay to the English forces. Edward abandoned him: he treated his subjects with the utmost barbarity; their animosity was roused against him; and du Guesclin having obtained his ransom, returned to Castile with the count of Trastamara, and some forces levied anew in France. They were joined by the Spanish malcontents; and having no longer the Black Prince to encounter, they gained a complete victory over Peter in the neighbourhood of Toledo. The tyrant now took refuge in a castle, where he was soon after besieged by the victors, and taken prisoner in endeavouring to make his escape. He was conducted to his brother Henry; against whom he is said to have rushed in a transport of rage, disarmed as he was. Henry slew him with his own hand, in resentment of his cruelties; and, though a bastard, was placed on the throne of Castile, which he transmitted to his posterity.

After the death of Peter the Cruel, nothing remarkable happened in Spain for almost a whole century; but the debaucheries of Henry IV. of Castile roused the resentment of his nobles, and produced a most singular insurrection, which led to the aggrandisement of the Spanish monarchy.

This prince, surnamed the *Impotent*, though continually surrounded with women, began his unhappy reign in 1454. He was totally enervated by his pleasures; and every thing in his court conspired to fetter the Castilians an example of the most abject flattery and most abandoned licentiousness. The queen, a daughter of Portugal, lived as openly with her parasites and her gallants as the king did with his minions and his mistresses. Pleasure was the only object, and effeminacy the only recommendation to favour the affairs of the state went every day into disorder; till the nobility, with the archbishop of Toledo at their head, combining against the weak and flagitious administration of Henry, arrogated to themselves, as one of the privileges of their order, the right of trying and passing sentence on their sovereigns, which they executed in a manner unprecedented in history.

All the malcontent nobility were summoned to meet at Avila: a spacious theatre was erected in a plain without the walls of the town: an image, representing the king, was seated on a throne, clad in royal robes,

with a crown on its head, a sceptre in its hand, and the sword of justice by its side. The accusation against Henry was read, and the sentence of deposition pronounced, in presence of a numerous assembly. At the close of the first article of the charge, the archbishop of Toledo advanced, and tore the crown from the head of the image; at the close of the second, the Conde de Placentia snatched the sword of justice from its side; at the close of the third, the Conde de Benavente wrested the sceptre from its hand; and at the close of the last, Don Diego Lopez de Stuniga tumbled it headlong from the throne. At the same instant, Don Alphonso, Henry's brother, a boy of about twelve years of age, was proclaimed king of Castile and Leon in his stead.

This extraordinary proceeding was followed by a civil war, which did not cease till some time after the death of the young prince, on whom the nobles had bestowed the kingdom. The archbishop and his party then continued to carry on war in the name of Isabella, the king's sister, to whom they gave the title of *Infanta*; and Henry could not extricate himself out of these troubles, nor remain quiet upon his throne, till he had signed one of the most humiliating treaties ever extorted from a sovereign: he acknowledged his sister Isabella the only lawful heirs of his kingdom, in prejudice to the rights of his reputed daughter Joan, whom the malcontents affirmed to be the offspring of an adulterous commerce between the queen and Don la Cueva. The grand object of the malcontent party now was the marriage of the princess Isabella, upon which, it was evident, the security of the crown and the happiness of the people must in a great measure depend. The alliance was sought by several princes: the king of Portugal offered her his hand; the king of France demanded her for his brother, and the king of Arragon for his son Ferdinand. The malcontents very wisely preferred the Aragonian prince, and Isabella prudently made the same choice: articles were drawn up; and they were privately married by the archbishop of Toledo.

Henry was enraged at this alliance, which he foresaw would utterly ruin his authority, by furnishing his rebellious subjects with the support of a powerful neighbouring prince. He disinherited his sister, and established the rights of his daughter. A furious civil war desolated the kingdom. The names of Joan and Isabella resounded from every quarter, and were every where the summons to arms. But peace was at length brought about. Henry was reconciled to his sister and Ferdinand; though it does not appear that he ever renewed Isabella's right to the succession: for he affirmed in his last moments, that he believed Joan to be his own daughter. The queen swore to the same effect; and Henry left a testamentary deed, transmitting the crown to his princess, who was proclaimed queen of Castile at Placentia. But the superior fortune and superior arms of Ferdinand and Isabella prevailed: the king of Portugal was obliged to abandon his niece and intended bride, after many ineffectual struggles, and several years of war. Joan retired into a convent; and the death of Ferdinand's father, which happened about this time, added the kingdoms of Arragon and Sicily to those of Leon and Castile.

Ferdinand and Isabella were persons of great pr-

dence, and, as sovereigns, highly worthy of imitation; but they do not seem to have merited all the praises bestowed upon them by the Spanish historians. They did not live like man and wife, having all things in common under the direction of the husband; but like two princes in close alliance: they neither loved nor hated each other; were seldom in company together; had each a separate council; and were frequently jealous of one another in the administration. But they were inseparably united in their common interests; always acting upon the same principles, and forwarding the same ends. Their first object was the regulation of their government, which the civil wars had thrown into the greatest disorder. Rapine, outrage, and murder, were become so common, as not only to interrupt commerce, but in a great measure to suspend all intercourse between one place and another. These evils the joint sovereigns suppressed by their wife policy, at the same time that they extended the royal prerogative.

About the middle of the 13th century, the cities in the kingdom of Arragon, and after their example those in Castile, had formed themselves into an association, distinguished by the name of the *Holy Brotherhood*. They exacted a certain contribution from each of the associated towns; they levied a considerable body of troops, in order to protect travellers and pursue criminals; and they appointed judges, who opened courts in various parts of the kingdom. Whoever was guilty of murder, robbery, or any act that violated the public peace, and was seized by the troops of the Brotherhood, was carried before their judges; who, without paying any regard to the exclusive jurisdiction which the lord of the place might claim, who was generally the author or abettor of the injustice, tried and condemned the criminals. The nobles often murmured against this salutary institution; they complained of it as an encroachment on one of their most valuable privileges, and endeavoured to get it abolished. But Ferdinand and Isabella, sensible of the beneficial effects of the Brotherhood, not only in regard to the police of their kingdom, but in its tendency to abridge, and by degrees annihilate, the territorial jurisdiction of the nobility, countenanced the institution upon every occasion, and supported it with the whole force of royal authority; by which means the prompt and impartial administration of justice was restored, and with it tranquillity and order returned.

But at the same time that their Catholic majesties (for such was the title they now bore) were giving vigour to their civil government, and securing their subjects from violence and oppression, an intemperate zeal led them to establish an ecclesiastical tribunal, equally contrary to the natural rights of humanity and the mild spirit of the gospel. This was the court of inquisition; which decides upon the honour, fortune, and even the life, of the unhappy wretch who happens to fall under the suspicion of heresy, or a contempt of any thing prescribed by the church, without his knowing, being confronted with his accusers, or permitted either defence or appeal. Six thousand persons were burnt by order of this sanguinary tribunal, within four years after the appointment of Torquemada, the first inquisitor-general; and upwards of 100,000 felt its fury. The same zeal, however, which led to the de- population

population, and the barbarizing of Spain, led also to its aggrandisement.

61
Conquest
of Granada.

The kingdom of Granada now alone remained of all the Mahometan possessions in Spain. Princes equally zealous and ambitious were naturally disposed to turn their eyes on that fertile territory, and to think of increasing their hereditary dominions, by expelling the enemies of Christianity, and extending its doctrines. Every thing conspired to favour their project: the Moorish kingdom was a prey to civil wars; when Ferdinand, having obtained the bull of Sixtus IV. authorizing a crusade, put himself at the head of his troops, and entered Granada. He continued the war with rapid success: Isabella attended him in several expeditions; and they were both in great danger at the siege of Malaga; an important city, which was defended with great courage, and taken in 1487. Baza was reduced in 1489, after the loss of 20,000 men. Guadix and Almeria were delivered up to them by the Moorish king Alazgel, who had first dethroned his brother-Alboacen, and afterwards been chased from his capital by his nephew Abdali. That prince engaged in the service of Ferdinand and Isabella; who, after reducing every other place of eminence, undertook the siege of Granada. Abdali made a gallant defence; but all communication with the country being cut off, and all hopes of relief at an end, he capitulated, after a siege of eight months, on condition that he should enjoy the revenue of certain places in the fertile mountains of Alpujarros; that the inhabitants should retain the undisturbed possession of their houses, goods, and inheritances; the use of their laws, and the free exercise of their religion. Thus ended the empire of the Arabs in Spain, after it had continued about 800 years. They introduced the arts and sciences into Europe at a time when it was lost in darkness; they possessed many of the luxuries of life, when they were not even known among the neighbouring nations; and they seem to have given birth to that romantic gallantry which so eminently prevailed in the ages of chivalry, and which, blending itself with the veneration of the northern nations for the softer sex, still particularly distinguishes ancient from modern manners. But the Moors, notwithstanding these advantages, and the eulogies bestowed upon them by some writers, appear always to have been destitute of the essential qualities of a polished people, humanity, generosity, and mutual sympathy.

62
Jews expelled
from Spain.

The conquest of Granada was followed by the expulsion, or rather the pillage and banishment, of the Jews, who had engrossed all the wealth and commerce of Spain. The inquisition exhausted its rage against these unhappy people, many of whom pretended to embrace Christianity, in order to preserve their property. About the same time their Catholic majesties concluded an alliance with the emperor Maximilian, and a treaty of marriage for their daughter Joan with his son Philip, archduke of Austria and sovereign of the Netherlands. About this time also the contract was concluded with Christopher Columbus for the discovery of new countries; and the counties of Roussillon and Cerdagne were agreed to be restored by Charles VIII. of France, before his expedition into Italy. The discovery of America was soon followed by extensive conquests in that quarter, as is related

Vol. X.

63
Discovery
of America,
&c.

under the articles MEXICO, PERU, CHILI, &c. which tended to raise the Spanish monarchy above any other in Europe.

Spain.

On the death of Isabella, which happened in 1506, Philip archduke of Austria came to Castile in order to take possession of that kingdom as heir to his mother-in-law; but he dying in a short time after, his son Charles V. afterwards emperor of Germany, became heir to the crown of Spain. His father at his death left the king of France governor to the young prince, and Ferdinand at his death left cardinal Ximenes sole regent of Castile, till the arrival of his grandson. This man, whose character is no less singular than illustrious, who united the abilities of a great statesman with the abject devotion of a superstitious monk, and the magnificence of a prime minister with the severity of a mendicant, maintained order and tranquility in Spain, notwithstanding the discontents of a turbulent and high-spirited nobility. When they disputed his right to the regency, he coolly showed them the testament of Ferdinand, and the ratification of that deed by Charles; but these not satisfying them, and argument proving ineffectual, he led them insensibly towards a balcony, whence they had a view of a large body of troops under arms, and a formidable train of artillery. "Behold," said the cardinal, "the powers which I have received from his Catholic majesty: by these I govern Castile; and will govern it, till the king, your master and mine, shall come to take possession of his kingdom." A declaration so bold and determined silenced all opposition; and Ximenes maintained his authority till the arrival of Charles in 1517.

65
Disgrace
and death
of cardinal
Ximenes.

The young king was received with universal acclamations of joy; but Ximenes found little cause to rejoice. He was seized with a violent disorder, supposed to be the effect of poison; and when he recovered, Charles, prejudiced against him by the Spanish grandees and his Flemish courtiers, slighted his advice, and allowed him every day to sink into neglect. The cardinal did not bear this treatment with his usual fortitude of spirit. He expected a more grateful return from a prince to whom he delivered a kingdom more flourishing than it had been in any former age, and authority more extensive and better established than the most illustrious of his ancestors had ever possessed. Conscious of his own integrity and merit, he could not therefore refrain from giving vent, at times, to indignation and complaint. He lamented the fate of his country, and foretold the calamities to which it would be exposed from the insolence, the rapaciousness, and the ignorance of strangers. But in the mean time he received a letter from the king, dismissing him from his councils, under pretence of easing his age of that burden which he had so long and so ably sustained. This letter proved fatal to the minister; for he expired in a few hours after reading it.

While Charles was taking possession of the throne of Maximilian Spain, in consequence of the death of one grandfather, attempts to another was endeavouring to obtain for him the imperial crown. With this view Maximilian assembled a diet at Augsburg, where he cultivated the favour of the electors by many acts of beneficence, in order to engage them to choose that young prince as his successor. But Maximilian himself never having been crowned by the pope, a ceremony deemed essential in that age,

41 D

28

Spain.

as well as in the preceding, he was considered only as king of the Romans, or emperor elect; and no example occurring in history of any person being chosen successor to a king of the Romans, the Germans, always tenacious of their forms, obstinately refused to confer upon Charles a dignity for which their constitution knew no name.

But though Maximilian could not prevail upon the German electors to choose his grandson of Spain king of the Romans, he had disposed their minds in favour of that prince; and other circumstances, on the death of the emperor, conspired to the exaltation of Charles. The imperial crown had so long continued in the Austrian line, that it began to be considered as hereditary in that family; and Germany, torn by religious disputes, stood in need of a powerful emperor, not only to preserve its own internal tranquillity, but also to protect it against the victorious arms of the Turks, who under Selim I. threatened the liberties of Europe. This fierce and rapid conqueror had already subdued the Mamelukes, and made himself master of Egypt and Syria. The power of Charles appeared necessary to oppose that of Selim. The extensive dominions of the house of Austria, which gave him an interest in the preservation of Germany; the rich sovereignty of the Netherlands and Franche-Comté; the entire possession of the great and warlike kingdom of Spain, together with that of Naples and Sicily, all united to hold him up to the first dignity among Christian princes; and the new world seemed only to be called into existence that its treasures might enable him to defend Christendom against the infidels. Such was the language of his partisans.

Francis I. however, no sooner received intelligence of the death of Maximilian, than he declared himself a candidate for the empire; and with no less confidence of success than Charles. He trusted to his superior years and experience; his great reputation in arms; and it was farther urged in his favour, that the impetuosity of the French cavalry, added to the firmness of the German infantry, would prove irresistible, and not only be sufficient, under a warlike emperor, to set limits to the ambition of Selim, but to break entirely the Ottoman power, and prevent it from ever becoming dangerous again to Germany.

Both claims were plausible. The dominions of Francis were less extensive, but more united than those of Charles. His subjects were numerous, active, brave, lovers of glory, and lovers of their king. These were strong arguments in favour of his power, so necessary at this juncture: but he had no natural interest in the Germanic body; and the electors, hearing so much of military force on each side, became more alarmed for their own privileges than the common safety. They determined to reject both candidates, and offered the imperial crown to Frederic, surname of the *Wise*, duke of Saxony. But he, dazzled by the splendour of an object connected with so much eagerness by two mighty monarchs, rejected it with a magnanimity no less singular than great.

68
Speech of
Frederic
duke of
Saxony in
favour of
Charles.

“Lu times of tranquillity,” said Frederic, “we wish for an emperor who has no power to invade our liberties; times of danger demand one who is able to secure our safety. The Turkish armies, led by a warlike and victorious monarch, are now assembling: they

are ready to pour in upon Germany with a violence unknown in former ages. New conjectures call for new expedients. The imperial sceptre must be committed to some hand more powerful than mine or that of any other German prince. We possess neither dominions, nor revenues, nor authority, which enable us to encounter such a formidable enemy. Recourse must be had, in this exigency, to one of the rival monarchs. Each of them can bring into the field forces sufficient for our defence. But as the king of Spain is of German extraction, as he is a member and prince of the empire by the territories which descend to him from his grandfather, and as his dominions stretch along that frontier which lies most exposed to the enemy, his claim, in my opinion, is preferable to that of a stranger to our language, to our blood, and to our country.” Charles was elected in consequence of this speech, in the year 1520.

Spain.

The two candidates had hitherto conducted their rivalry with emulation, but without enmity. They had even mingled their competition with many expressions of friendship and regard. Francis in particular, declared with his usual vivacity, that his brother Charles and he were fairly and openly suitors to the same mistress: “The most assiduous and fortunate,” added he, “will win her; and the other must rest contented.” But the preference was no sooner given to his rival, than Francis discovered all the passions natural to disappointed ambition. He could not suppress his chagrin and indignation at being balked in his favourite pursuit, and rejected, in the face of all Europe, for a youth yet unknown to fame. The spirit of Charles resented such contempt: and from this hatred jealousy, as much as from opposition of interests, arose that emulation between those two great monarchs which involved them in almost perpetual hostilities, and kept their whole age in movement.

Charles and Francis had many interfering claims in Italy; and the latter thought himself bound in honour to restore the king of Navarre to his dominions, unjustly seized by the crown of Spain. They immediately began to negotiate; and as Henry VIII. of England was the third prince of the age in power and in dignity, his friendship was eagerly courted by each of the rivals. He was the natural guardian of the liberties of Europe. Sensible of the consequence which his situation gave him, and proud of his pre-eminence, Henry knew it to be his interest to keep the balance even between the contending powers, and to restrain both, by not joining entirely with either; but he was seldom able to reduce his ideas to practice. Vanity and resentment were the great springs of all his undertakings; and his neighbours, by touching these, found an easy way to draw him into their measures, and force him upon many rash and inconsiderate enterprises.

All the impolitic steps in Henry's government must not, however, be imputed to himself; many of them were occasioned by the ambition and avarice of his prime minister and favourite cardinal Wolsey. This man, who, by his talents and accomplishments, had risen from one of the lowest conditions in life to the highest employments both in church and state, enjoyed a greater degree of power and dignity than any English subject ever possessed, and governed the haughty, presumptuous, and untractable spirit of Henry with abso-

Spain. absolute authority. Francis was equally well acquainted with the character of Henry and of his minister. He had successfully flattered Wolsey's pride, by honouring him with particular marks of his confidence, and bestowing upon him the appellations of *Father, Tutor, and Governor*; and he had obtained the reliction of Tournay, by adding a pension to those respectful titles. He now solicited an interview with the king of England near Calais; in hopes of being able, by familiar conversation, to attach him to his friendship and interest, while he gratified the cardinal's vanity, by affording him an opportunity of displaying his magnificence in the presence of two courts, and of discovering to the two nations his influence over their monarchs. Charles dreaded the effects of this projected interview between two gallant princes, whose hearts were no less susceptible of friendship than their manners were of inspiring it. Finding it impossible, however, to prevent a visit, in which the vanity of all parties was so much concerned, he endeavoured to defeat its purpose, and to pre-occupy the favour of the English monarch, and of his minister, by an act of complaisance still more flattering and more uncommon.

cis and
Henry.

73
Charles vi-
sits Henry
in England.

Relying wholly upon Henry's generosity for his safety, he landed at Dover, in his way from Spain to the Low Countries. The king of England, who was on his way to France, charmed with such an instance of confidence, hastened to receive his royal guest; and Charles, during his short stay, had the address not only to give Henry favourable impressions of his character and intentions, but to detach Wolsey entirely from the interest of Francis. The tiara had attracted the eye of that ambitious prelate; and as the emperor knew that the papacy was the sole point of elevation, beyond his present greatness, at which he could aspire, he made him an offer of his interest on the first vacancy.

The day of Charles's departure, Henry went over to Calais with his whole court, in order to meet Francis. Their interview was in an open plain between Guisnes and Ardres; where the two kings and their attendants displayed their magnificence with such emulation and profuse expence, as procured it the name of the *Field of the Cloth of Gold*. Here Henry erected a spacious house of wood and canvas, framed in London, on which, under the figure of an English archer, was the following motto: "He prevails whom I favour;" alluding to his own political situation, as holding in his hands the balance of power among the potentates of Europe. Feats of chivalry, however, parties of gallantry, and such exercises as were in that age reckoned manly or elegant, rather than serious business, occupied the two courts during the time that they continued together, which was 18 days.

After taking leave of this scene of dissipation, the king of England paid a visit to the emperor and Margaret of Savoy at Gravelines, and engaged them to go along with him to Calais; where the artful and politic Charles completed the impression which he had begun to make on Henry and his favourite, and effaced all the friendship to which the frank and generous nature of Francis had given birth. He renewed his assurances of assisting Wolsey in obtaining the papacy; and he put him in present possession of the revenues belonging to the sees of Badajoz and Palencia in Spain. He flattered Henry's pride, by convincing

74
Henry visits
Francis in
France.

him of his own importance, and of the justness of the motto which he had chosen; offering to submit to his sole arbitration any difference that might arise between him and Francis.

This important point being secured, Charles repaired to Aix-la-Chapelle, where he was solemnly invested with the crown and sceptre of Charlemagne, in presence of a more splendid and numerous assembly than had appeared on any former inauguration. About the same time Solymán the Magnificent, one of the most accomplished, enterprising, and victorious of the Turkish princes, and a constant and formidable rival to the emperor, ascended the Ottoman throne.

The first act of Charles's administration was, to appoint a diet of the empire, to be held at Worms, in order to concert with the princes proper measures for checking the progress of "those new and dangerous opinions which threatened to disturb the peace of Germany, and to overturn the religion of their ancestors." The opinions propagated by Luther and his followers were here meant. But all his efforts for that purpose were insufficient, as is related under the articles LUTHER and REFORMATION.

In 1521 the Spaniards, dissatisfied with the departure of their sovereign, whose election to the empire they foresaw would interfere with the administration of his own kingdom, and incensed at the avarice of the Flemings, to whom the direction of public affairs had been committed since the death of cardinal Ximenes, several grandees, in order to shake off this oppression, entered into an association, to which they gave the name of the *Santa Junta*; and the sword was appealed to as the means of redress. This seemed to Francis a favourable juncture for reinstating the family of John d'Albret in the kingdom of Navarre. Charles was at a distance from that part of his dominions, and the troops usually stationed there had been called away to quell the commotions in Spain. A French army, under Andrew de Foix, speedily conquered Navarre; but that young and inexperienced nobleman, pushed on by military ardour, ventured to enter Calatze. The Spaniards, though divided among themselves, united against a foreign enemy, routed his forces, took him prisoner, and recovered Navarre in a shorter time than he had spent in subduing it.

Hostilities thus begun in one quarter, between the rival monarchs, soon spread to another. The king of France encouraged the duke of Bouillon to make war against the emperor, and invade Luxembourg. Charles, after humbling the duke, attempted to enter France; but was repelled and worsted before Mezières, by the famous chevalier Bayard, distinguished among his contemporaries by the appellation of *The Knight without fear and without reproach*; and who united the talents of a great general to the punctilious honour and romantic gallantry of the heroes of chivalry. Francis broke into the Low Countries, where, by an excess of caution, an error not natural to him, he lost an opportunity of cutting off the whole imperial army; and, what was of still more consequence, he disgusted the constable Bourbon, by giving the command of the van to the duke of Alençon.

During these operations in the field, an unsuccessful congress was held at Calais, under the mediation of

Spain.

Spain.

Henry VIII. It served only to exasperate the parties which it was intended to reconcile. A league was soon after concluded, by the intrigues of Wolsey, between the pope, Henry, and Charles, against France. Leo had already entered into a separate league with the emperor, and the French were fast losing ground in Italy.

The infolence and exactions of Marechal de Lautrec, governor of Milan, had totally alienated the affections of the Milanese from France. They resolved to expel the troops of that nation, and put themselves under the government of Francis Sforza, brother to Maximilian their late duke. In this resolution they were encouraged by the pope, who excommunicated Lautrec, and took into his pay a considerable body of Swifs. The papal army, commanded by Prosper Colonna, an experienced general, was joined by supplies from Germany and Naples; while Lautrec, neglected by his court, and deserted by the Swifs in its pay, was unable to make head against the enemy. The city of Milan was betrayed by the inhabitants to the confederates; Parma and Placentia were united to the ecclesiastical state; and of their conquests in Lombardy, only the town of Cremona, the castle of Milan, and a few inconsiderable forts, remained in the hands of the French.

Leo X. received the accounts of this rapid success with such transports of joy, as are said to have brought on a fever, which occasioned his death. The spirit of the confederacy was broken, and its operations suspended by this accident. The Swifs were recalled; some other mercenaries disbanded for want of pay; and only the Spaniards, and a few Germans in the emperor's service, remained to defend the duchy of Milan. But Lautrec, who with the remnant of his army had taken shelter in the Venetian territories, destitute both of men and money, was unable to improve this favourable opportunity as he wished. All his efforts were rendered ineffectual by the vigilance and ability of Colonna and his associates.

Meantime much discord prevailed in the conclave. Wolsey's name, notwithstanding all the emperor's magnificent promises, was scarcely mentioned there. Julio de Medici, Leo's nephew, thought himself sure of the election; when, by an unexpected turn of fortune, cardinal Adrian of Utrecht, Charles's preceptor, who at that time governed Spain in the emperor's name, was unanimously raised to the papacy, to the astonishment of all Europe and the great disgust of the Italians.

Francis, roused by the rising consequence of his rival, resolved to exert himself with fresh vigour, in order to wrest from him his late conquests in Lombardy. Lautrec received a supply of money, and a recruit of 10,000 Swifs. With this reinforcement he was enabled once more to act offensively, and even to advance within a few miles of the city of Milan; when money again failing him, and the Swifs growing mutinous, he was obliged to attack the imperialists in their camp at Bicocca, where he was repulsed with great slaughter, having lost his bravest officers and best troops. Such of the Swifs as survived set out immediately for their own country; and Lautrec, despairing of being able to keep the field, retired into France. Genoa, which still remained

subject to Francis, and made it easy to execute any scheme for the recovery of Milan, was soon after taken by Colonna: the authority of the emperor and his faction was every where established in Italy. The citadel of Cremona was the sole fortress which remained in the hands of the French.

The affliction of Francis for such a succession of misfortunes was augmented by the unexpected arrival of an English herald, who in the name of his sovereign declared war against France. The courage of this excellent prince, however, did not forsake him; tho' his treasury was exhausted by expensive pleasures, no less than by hostile enterprises, he assembled a considerable army, and put his kingdom in a posture of defence for resisting this new enemy, without abandoning any of the schemes which he was forming against the emperor. He was surprised, but not alarmed, at such a denunciation.

Meanwhile Charles, willing to draw as much advantage as possible from so powerful an ally, paid ⁷⁹ Charles visits England a second time. His success exceeded his most sanguine expectations. He not only gained the entire friendship of Henry, who publicly ratified the treaty of Bruges; but disarmed the resentment of Wolsey, by assuring him of the papacy on Adrian's death; an event seemingly not distant, by reason of his age and infirmities. In consequence of these negotiations an English army invaded France, under the command of the earl of Surrey; who, at the end of the campaign, was obliged to retire, with his forces greatly reduced, without being able to make himself master of one place within the French frontier. Charles was more fortunate in Spain: he soon quelled the tumults which had there arisen in his absence.

While the Christian princes were thus wasting each other's strength, Solymán the Magnificent entered Hungary, and made himself master of Belgrade, reckoned the chief barrier of that kingdom against the Turkish power. Encouraged by this success, he turned his victorious arms against the island of Rhodes, at that time the seat of the knights of St John of Jerusalem; and though every prince in that age acknowledged Rhodes to be the great bulwark ⁸⁰ Rhodes taken by Solymán of Christendom in the east, so violent was their animosity against each other, that they suffered Solymán without disturbance to carry on his operations against that city and island. Lisle Adam, the grand-master, made a gallant defence; but, after incredible efforts of courage, patience, and military conduct, during a siege of six months, he was obliged to surrender the place, having obtained an honourable capitulation from the sultan, who admired and respected his heroic qualities. See RHODES and MALTA. Charles and Francis were equally ashamed of having occasioned such a loss to Christendom by their contentions; and the emperor, by way of reparation, granted to the knights of St John the small island of Malta, where they fixed their residence, and continued long to retain their ancient spirit, though much diminished in power and splendour.

Adrian VI. though the creature of the emperor and devoted to his interest, endeavoured to assume the impartiality which became the common father of Christen-

Spain.

Christendom, and laboured to reconcile the contending princes, that they might unite in a league against Solymán, whose conquest of Rhodes rendered him more formidable than ever to Europe. The Italian states were no less desirous of peace than the pope : and so much regard was paid by the hostile powers to the exhortations of his holiness, and to a bull which he issued, requiring all Christian princes to consent to a truce for three years, that the imperial, the French, and the English ambassadors at Rome, were empowered to treat of that matter; but while they waited their time in fruitless negotiations, their masters were continuing their preparations for war; and other negotiations soon took place. The confederacy against France became more formidable than ever.

81
A powerful
confederacy
against
Francis.

The Venetians, who had hitherto adhered to the French interest, formed engagements with the emperor for securing Francis Sforza in the possession of the duchy of Milan; and the pope, from a persuasion that the ambition of the French monarch was the only obstacle to peace, acceded to the same alliance. The Florentines, the dukes of Ferrara and Mantua, and all the Italian powers, followed this example. Francis was left, without a single ally, to resist the efforts of a multitude of enemies, whose armies every where threatened, and whose territories encompassed his dominions. The emperor in person menaced France with an invasion on the side of Guienne; the forces of England and the Netherlands hovered over Picardy, and a numerous body of Germans was preparing to ravage Burgundy.

The dread of so many and such powerful adversaries, it was thought, would have obliged Francis to keep wholly on the defensive, or at least have prevented him from entertaining any thoughts of marching into Italy. But before his enemies were able to strike a blow, Francis had assembled a great army, with which he hoped to disconcert all the emperor's schemes, by marching it in person into Italy: and this bold measure, the more formidable because unexpected, could scarcely have failed of the desired effect, had it been immediately carried into execution. But the discovery of a domestic conspiracy, which threatened the destruction of his kingdom, obliged Francis to stop short at Lyons.

82
Francis
marches to-
wards Italy,

ged to re-
turn by a
domestic
conspiracy.

Charles duke of Bourbon, lord high constable of France, was a prince of the most shining merit: his great talents equally fitted him for the council or the field, while his eminent services to the crown entitled him to its first favour. But unhappily Louisa duchess of Angouleme, the king's mother, had contracted a violent aversion against the house of Bourbon, and had taught her son, over whom she had acquired an absolute ascendancy, to view all the constable's actions with a jealous eye. After repeated affronts he retired from court, and began to listen to the advances of the emperor's ministers. Meantime the duchess of Bourbon died; and as the constable was no less amiable than accomplished, the duchess of Angouleme, still susceptible of the tender passions, formed the scheme of marrying him. But Bourbon, who might have expected every thing to which an ambitious mind can aspire, from the doating fondness of a woman who governed her son and the kingdom, incapable of imitating Louisa in her sudden transition from hate to love, or of

meanly counterfeiting a passion for one who had so long pursued him with unprovoked malice, rejected the match with disdain, and turned the proposal into ridicule. At once despised and insulted by the man whom love only could have made her cease to persecute, Louisa was filled with all the rage of disappointed woman; she resolved to ruin, since she could not marry, Bourbon. For this purpose she commenced an iniquitous suit against him; and by the chicanery of chancellor du Prat, the constable was stripped of his whole family-estate. Driven to despair by so many injuries, he entered into a secret correspondence with the emperor and the king of England; and he proposed, as soon as Francis should have crossed the Alps, to raise an insurrection among his numerous vassals, and introduce foreign enemies into the heart of France.

Happily Francis got intimation of this conspiracy before he left the kingdom: but not being sufficiently convinced of the Constable's guilt, he suffered so dangerous a foe to escape; and Bourbon, entering into the emperor's service, employed all the force of his enterprising genius, and his great talents for war, to the prejudice of his prince and his native country.

In consequence of the discovery of this plot, and the escape of the powerful conspirator, Francis relinquished his intention of leading his army in person into Italy. He was ignorant how far the infection had spread among his subjects, and afraid that his absence might encourage them to make some desperate attempt in favour of a man so much beloved. He did not, however, abandon his design on the Milanese, but sent forward an army of 30,000 men, under the command of admiral Bonnavet. Colonna, who was entrusted with the defence of that duchy, was in no condition to resist such a force; and the city of Milan, on which the whole territory depends, must have fallen into the hands of the French, had not Bonnavet, who possessed none of the talents of a general, waited his time in frivolous enterprises, till the inhabitants recovered from their consternation. The imperial army was reinforced. Colonna died; and Lannoy, viceroy of Naples, succeeded him in the command: but the chief direction of military operations was committed to Bourbon and the marquis de Pescara, the greatest generals of their age. Bonnavet, destitute of troops to oppose this new army, and still more of the talents which could render him a match for its leaders, after various movements and encounters, was reduced to the necessity of attempting a retreat into France. He was followed

83

army enters
Italy.

by the imperial generals, and routed at Biagrasa, where the famous chevalier Bayard was killed.

The emperor and his allies were less successful in their attempts upon France. They were baffled in every quarter: and Francis, though stripped of his Italian dominions, might still have enjoyed in safety the glory of having defended his native kingdom against one half of Europe, and have bid defiance to all his enemies; but understanding that the king of England, discouraged by his former fruitless enterprises, and disgusted with the emperor, was making no preparations for any attempt on Picardy, his ancient ardour seized him for the conquest of Milan, and he deter- mined, notwithstanding the advanced season, to march into Italy.

85
Francis de-
termines

Spain.

than the whole Milanese was thrown into consternation. The capital opened its gates. The forces of the emperor and Sforza retired to Lodi: and had Francis been so fortunate as to pursue them, they must have abandoned that post, and been totally dispersed; but his evil genius led him to besiege Pavia, a town of considerable strength, well garrisoned, and defended by Antonio de Leyva, one of the bravest officers in the Spanish service; before which place he was defeated and taken prisoner, as related under the article FRANCE, n° 73.

86
Is defeated
and taken
prisoner at
Pavia.

The captivity of Francis filled all Europe with alarm. Almost the whole French army was cut off; Milan was immediately abandoned; and in a few weeks not a Frenchman was left in Italy. The power of the emperor, and still more his ambition, became an object of universal terror; and resolutions were every where taken to set bounds to it. Meanwhile Francis, deeply impressed with a sense of his misfortune, wrote to his mother Louisa, whom he had left regent of the kingdom, the following short, but expressive letter: "All, Madam, is lost but honour." The same courier that carried this letter, carried also dispatches to Charles; who received the news of the signal and unexpected success which had crowned his arms with the most hypocritical moderation. He would not suffer any public rejoicings to be made on account of it; and said, he only valued it, as it would prove the occasion of restoring peace to Christendom. Louisa, however, did not trust to those appearances; if she could not preserve what was yet left, she determined at least that nothing should be lost through her negligence or weakness. Instead of giving herself up to such lamentations as were natural to a woman so remarkable for maternal tenderness, she discovered all the foresight, and exerted all the activity of a consummate politician. She took every possible measure for putting the kingdom in a posture of defence, while she employed all her address to appease the resentment and to gain the friendship of England; and a ray of comfort from that quarter soon broke in upon the French affairs.

87
Hypocritical
conduct
of Charles.

Though Henry VIII. had not entered into the war against France from any concerted political views, he had always retained some imperfect idea of that balance of power which it was necessary to maintain between Charles and Francis; and the preservation of which he boasted to be his peculiar office. By his alliance with the emperor, he hoped to recover some part of those territories on the continent which had belonged to his ancestors; and therefore willingly contributed to give him the ascendancy above his rival; but having never dreamt of any event so decisive and fatal as the victory at Pavia, which seemed not only to have broken, but to have annihilated the power of Francis, he now became sensible of his own danger, as well as that of all Europe, from the loss of a proper counterpoise to the power of Charles. Instead of taking advantage of the distressed condition of France, Henry therefore determined to assist her in her present calamities. Some disputes also had taken place between him and Charles, and still more between Charles and Wolsey. The elevation of the cardinal of Medici to St Peter's chair, on the death of Adrian, under the name of Clement VII. had made the English minister sensible of the influence

89
France as-
sisted by
Henry VIII.

of the emperor's promises, while it extinguished all his hopes of the papacy; and he resolved on revenge. Charles, too, had so ill supported the appearance of moderation which he assumed, when first informed of his good fortune, that he had already changed his usual style to Henry; and instead of writing to him with his own hand, and subscribing himself "your affectionate son and cousin," he dictated his letters to a secretary, and simply subscribed himself "Charles." Influenced by all these motives, together with the glory of raising a fallen enemy, Henry listened to the flattering submissions of Louisa; entered into a defensive alliance with her as regent of France, and engaged to use his best offices in order to procure the deliverance of her son from a state of captivity.

Meanwhile Francis was rigorously confined; and Francis severely conditions being proposed to him as the price of his liberty, he drew his dagger, and, pointing it at his breast, cried, " 'Twere better that a king should die thus!" His hand was with-held; and flattering himself, when he grew cool, that such propositions could not come directly from Charles, he desired that he might be removed to Spain, where the emperor then resided. His request was complied with; but he languished long before he obtained a sight of his conqueror. At last he was favoured with a visit; and the emperor dreading a general combination against him, or that Francis, as he threatened, might, in the obstinacy of his heart, resign his crown to the dauphin, agreed to abate somewhat of his former demands. A treaty was accordingly concluded at Madrid; in consequence of which Francis obtained his liberty. The chief article in this treaty was, that Burgundy should be restored to Charles as the rightful inheritance of his ancestors, and that Francis's two eldest sons should be immediately delivered up as hostages for the performance of the conditions stipulated. The exchange of the captive monarch for his children was made on the borders between France and Spain. The moment that Francis entered his own dominions, he mounted a Turkish horse, and putting it to its speed, waved his hand, and cried aloud several times, "I am yet a king! I am yet a king!"

90
Is at last
released.

Francis never meant to execute the treaty of Madrid; he had even left a protest in the hands of notaries before he signed it, that his consent should be considered as an involuntary deed, and be deemed null and void. Accordingly, as soon as he arrived in France, he assembled the states of Burgundy, who protested against the article relative to their province; and Francis coldly replied to the imperial ambassadors, who urged the immediate execution of the treaty, that he would religiously perform the articles relative to himself, but in those affecting the French monarchy, he must be directed by the sense of the nation. He made the highest acknowledgments to the king of England for his friendly interposition, and offered to be entirely guided by his counsels. Charles and his ministers saw that they were over-reached in those very arts of negotiation in which they so much excelled, while the Italian states observed with pleasure, that Francis was resolved not to execute a treaty which they considered as dangerous to the liberties of Europe. Clement absolved him from the oath which he had

89

of his re-
lease.

Spain.

had taken at Madrid; and the kings of France and England, the Pope, the Swiss, the Venetians, the Florentines, and the duke of Milan, entered into an alliance, to which they gave the name of the *Holy League*, because his Holiness was at the head of it, in order to oblige the emperor to deliver up Francis's two sons on the payment of a reasonable ransom, and to re-establish Sforza in the quiet possession of the Milanese.

In consequence of this league, the confederate army took the field, and Italy once more became the scene of war. But Francis, who it was thought would have infused spirit and vigour into the whole body, had gone through such a scene of distress, that he was become diffident of himself, distrustful of his fortune, and desirous of tranquillity. He flattered himself, that the dread alone of such a confederacy would induce Charles to listen to what was equitable, and therefore neglected to send due reinforcements to his allies in Italy. Meantime the duke of Bourbon, who commanded the Imperialists, had made himself master of the whole Milanese, of which the emperor had promised him the investiture; and his troops beginning to mutiny for want of pay, he led them to Rome, and promised to enrich them with the spoils of that city. He was as good as his word; for though he himself was slain in planting a scaling ladder against the walls, his soldiers, rather enraged than discouraged by his death, mounted to the assault with the utmost ardour, animated by the greatness of the prize, and, entering the city sword in hand, plundered it for several days.

92
Rome taken
by the im-
perialists.

Never did Rome in any age suffer so many calamities, not even from the Barbarians, by whom she was often subdued, the Huns, Vandals, or Goths, as now from the subjects of a Christian and Catholic monarch. Whatever was respectable in modesty, or sacred in religion, seemed only the more to provoke the rage of the soldiery. Virgins suffered violation in the arms of their parents, and upon those altars to which they had fled for safety. Venerable prelates, after enduring every indignity and every torture, were thrown into dungeons, and menaced with the most cruel death, in order to make them reveal their secret treasures. Clement himself, who had neglected to make his escape in time, was taken prisoner, and found, that the sacredness of his character could neither procure him liberty nor respect. He was confined till he should pay an enormous ransom imposed by the victorious army, and surrender to the emperor all the places of strength belonging to the church.

93
And most
cruelly
plundered.

94
The Pope
confined.

95
Shameful
hypocrisy of
Charles.

Charles received the news of this extraordinary event with equal surprise and pleasure; but in order to conceal his joy from his Spanish subjects, who were filled with horror at the insult offered to the sovereign pontiff, and to lessen the indignation of the rest of Europe, he expressed the most profound sorrow for the success of his arms. He put himself and his court into mourning; stopped the rejoicings for the birth of his son Philip, and ordered prayers to be put up in all the churches of Spain for the recovery of the Pope's liberty, which he could immediately have procured by a letter to his generals.

The concern expressed by Henry and Francis for the calamity of their ally was more sincere. Alarmed at the progress of the imperial arms, they had,

even before the taking of Rome, entered into a closer alliance, and agreed to invade the Low-Countries with a powerful army; but no sooner did they hear of the Pope's captivity, than they changed, by a new treaty, the scene of the projected war from the Netherlands to Italy, and resolved to take the most vigorous measures for restoring him to liberty. Henry, however, contributed only money. A French army entered Italy, under the command of Marshal Lautrec; Clement obtained his freedom; and war was for a time carried on by the confederates with success; but the death of Lautrec, and the revolt of Andrew Doria, a Genoese admiral in the service of France, entirely changed the face of affairs. The French army was utterly ruined; and Francis, discouraged and almost exalted by so many unsuccessful enterprises, began to think of peace, and of obtaining the release of his sons by concessions, not by the terror of his arms.

At the same time Charles, notwithstanding the advantages he had gained, had many reasons to wish for an accommodation. Sultan Solymán having over-run Hungary, was ready to break in upon the Austrian territories with the whole force of the East; and the progress of the Reformation in Germany threatened the tranquillity of the empire. In consequence of this situation of affairs, though pride made both parties conceal or dissemble their real sentiments, two ladies were permitted to restore peace to Europe. Margaret of Austria, Charles's aunt, and Louisa, Francis's mother, met in 1529 at Cambray, and settled the terms of accommodation between the French king and the emperor. Francis agreed to pay two millions of crowns as the ransom of his two sons, to resign the sovereignty of Flanders and Artois, and forego all his Italian claims; and Charles ceased to demand the restitution of Burgundy.

96
A French
army en-
ters Italy,
but utterly
ruined.

97
Peace con-
cluded at
Cambray.

All the steps of this negotiation had been communicated to the king of England; and Henry was, on that occasion, so generous to his friend and ally Francis, that he sent him an acquittal of near six hundred thousand crowns, in order to enable him to fulfil his agreement with Charles. But Francis's Italian confederates were less satisfied with the treaty of Cambray. They were almost wholly abandoned to the will of the emperor; and seemed to have no other means of security left but his equity and moderation. Of these, from his past conduct, they had not formed the most advantageous idea. But Charles's present circumstances, more especially in regard to the Turks, obliged him to behave with a generosity inconsistent with his character. The Florentines alone, whom he reduced under the dominion of the family of Medici, had reason to complain of his severity. Sforza obtained the investiture of Milan and his pardon; and every other power experienced the lenity of the conqueror.

After having received the imperial crown from the hands of the Pope at Bologna, Charles proceeded on his journey to Germany, where his presence was become highly necessary; for although the conduct and valour of his brother Ferdinand, on whom he had conferred the hereditary dominions of the house of Austria, and who had been elected king of Hungary, had obliged Solymán to retire with infamy and loss, his return was to be feared, and the disorders of religion were daily increasing; an account of which, and

98

many.

of.

Spain: of the emperor's transactions with the Protestants, is given under the article REFORMATION.

99 He undertakes an expedition against the state of Barbary. Charles having exerted himself as much as he could against the reformers, undertook his first expedition against the piratical states of Africa. Barbary, or that part of the African continent lying along the coast of the Mediterranean sea, was then nearly in the same condition which it is at present. Morocco, Algiers, and Tunis, were its principal states; and the two last were nests of pirates. Barbarossa, a famous Corsair, had succeeded his brother in the kingdom of Algiers, which he had formerly assisted him to usurp. He regulated with much prudence the interior police of his kingdom, carried on his piracies with great vigour, and extended his conquests on the continent of Africa; but perceiving that the natives submitted to his government with impatience, and fearing that his continual depredations would one day draw upon him a general combination of the Christian powers, he put his dominions under the protection of the grand seignor. Solymán, flattered by such an act of submission, and charmed with the boldness of the man, offered him the command of the Turkish fleet. Proud of this distinction, Barbarossa repaired to Constantinople, and made use of his influence with the sultan to extend his own dominion. Partly by force, partly by treachery, he usurped the kingdom of Tunis; and being now possessed of greater power, he carried on his depredations against the Christian states with more destructive violence than ever.

Daily complaints of the piracies and ravages committed by the galleys of Barbarossa were brought to the emperor by his subjects, both in Spain and Italy; and all Christendom seemed to look up to him, as its greatest and most fortunate prince, for relief from this new and odious species of oppression. At the same time Muley-Hascen, the exiled king of Tunis, finding none of the African princes able or willing to support him in recovering his throne, applied to Charles for assistance against the usurper. Equally desirous of delivering his dominions from the dangerous neighbourhood of Barbarossa, of appearing as the protector of an unfortunate prince, and of acquiring the glory annexed in that age to every expedition against the Mahometans, the emperor readily concluded a treaty with Muley-Hascen, and set sail for Tunis with a formidable armament. The Goletta, a sea-port town, fortified with 300 pieces of cannon, was taken, together with all Barbarossa's fleet: he was defeated in a pitched battle; and 10,000 Christian slaves, having knocked off their fetters, and made themselves masters of the citadel, Tunis was preparing to surrender; but while Charles was deliberating on the conditions, his troops fearing that they would be deprived of the booty which they had expected, broke suddenly into the town, and pillaged and massacred without distinction. Thirty thousand persons perished by the sword, and 10,000 were made prisoners. The sceptre was restored to Muley-Hascen, on condition that he should acknowledge himself a vassal of the crown of Spain, put into the emperor's hands all the fortified sea-ports in the kingdom of Tunis, and pay annually 12,000 crowns for the subsistence of the Spanish garrison in the Goletta. These

points being settled, and 20,000 Christian slaves freed from bondage either by arms or by treaty, Charles returned to Europe, where his presence was become necessary; while Barbarossa, who had retired to Bona, recovered new strength, and again became the tyrant of the ocean.

The king of France took advantage of the emperor's absence to revive his pretensions in Italy. The treaty of Cambray had covered up, but not extinguished, the flames of discord. Francis in particular, who waited only for a favourable opportunity of recovering the territories and reputation which he had lost, continued to negotiate against his rival with different courts. But all his negotiations were disconcerted by unforeseen accidents. The death of Clement VII. (whom he had gained by marrying his son the duke of Orleans, afterwards Hen. II. to Catharine of Medici, the niece of that pontiff), deprived him of all the support which he hoped to receive from the court of Rome. The king of England, occupied with domestic cares and projects, declined engaging in the affairs of the continent; and the Protestant princes, associated by the league of Smalkalde, to whom also Francis had applied, and who seemed disposed at first to listen to him, filled with indignation and resentment at the cruelty with which some of their reformed brethren had been treated in France, refused to have any connection with the enemy of their religion.

Francis was neither cruel nor bigotted: he was too indolent to concern himself about religious disputes; but his principles becoming suspected, at a time when the emperor was gaining immortal glory by his expedition against the Infidels, he found it necessary to vindicate himself by some extraordinary demonstration of reverence for the established faith. The indiscreet zeal of some Protestant converts furnished him with the occasion. They had affixed to the gates of the Louvre, and other public places, papers containing indecent reflections on the rites of the Romish church. Six of the persons concerned in this rash action were seized; and the king, pretending to be struck with horror at their blasphemies, appointed a solemn procession, in order to avert the wrath of heaven. The holy sacrament was carried through the city of Paris in great pomp: Francis walked uncovered before it, bearing a torch in his hand; the princes of the blood supported the canopy over it; the nobles walked behind. In presence of this numerous assembly, the king declared, that if one of his hands were infected with heresy, he would cut it off with the other; "and I would sacrifice," added he, "even my own children, if found guilty of that crime." As an awful proof of his sincerity, the six unhappy persons who had been seized were publicly burnt, before the procession was finished, and in the most cruel manner. They were fixed upon a machine which descended into the flames, and retired alternately, until they expired.—Little wonder that the Protestant princes were incensed at such barbarity!

But Francis, though unsupported by any ally, commanded his army to advance towards the frontiers of Italy, under pretence of chastising the duke of Milan for a breach of the law of nations, in putting to death his ambassador. The operations of war, however, soon took a new direction. Instead of marching directly

directly to the Milanese, Francis commenced hostilities against the duke of Savoy, with whom he had cause to be dissatisfied, and on whom he had some claims; and before the end of the campaign, that feeble prince saw himself stripped of all his dominions, except the province of Piedmont. To complete his misfortunes, the city of Geneva, the sovereignty of which he claimed, and where the reformed opinions had already got footing, threw off his yoke; and its revolt drew along with it the loss of the adjacent territory. Geneva was then an imperial city, and has ever since remained entirely free.

104
Geneva
throws off
the yoke of
the duke of
Savoy.

In this extremity, the duke of Savoy saw no resource but in the emperor's protection; and as his misfortunes were chiefly occasioned by his attachment to the imperial interest, he had a title to immediate assistance. But Charles, who was just returned from his African expedition, was not able to lend him the necessary support. His treasury was entirely drained, and he was obliged to disband his army till he could raise new supplies. Mean time the death of Sforza duke of Milan entirely changed the nature of the war, and afforded the emperor full leisure to prepare for action. The French monarch's pretext for taking up arms was at once cut off; but as the duke died without issue, all Francis's rights to the duchy of Milan, which he had yielded only to Sforza and his descendants, returned to him in full force. He instantly renewed his claim to it; and if he had ordered his army immediately to advance, he might have made himself master of it. But he unfortunately wasted his time in fruitless negotiations, while his more politic rival took possession of the duchy as a vacant fief of the empire; and though Charles seemed still to admit the equity of Francis's claim, he delayed granting the investiture under various pretences, and was secretly taking every possible measure to prevent his regaining footing in Italy.

105
Charles
takes pos-
session of
Milan.

During the time gained in this manner, Charles had recruited his finances, and of course his armies; and finding himself in a condition for war, he at last threw off the mask under which he had so long concealed his designs from the court of France. Entering Rome with great pomp, he pronounced before the pope and cardinals, assembled in full consistory, a violent invective against Francis, by way of reply to his propositions concerning the investiture of Milan. Yet Francis, by an unaccountable fatality, continued to negotiate, as if it had been still possible to terminate their differences in an amicable manner; and Charles, finding him so eager to run into the snare, favoured the deception, and, by seeming to listen to his proposals, gained yet more time for the execution of his ambitious projects.

106
Weakness
of Francis.

107
Charles at-
tempts to
subvert the
French
monarchy.

If misfortunes had rendered Francis too diffident, success had made Charles too sanguine. He presumed on nothing less than the subversion of the French monarchy; nay, he considered it as an infallible event. Having chafed the forces of his rival out of Piedmont and Savoy, he pushed forward at the head of 50,000 men, contrary to the advice of his most experienced ministers and generals, to invade the southern provinces of France; while other two armies were ordered to enter it, the one on the side of Picardy, the other on the side of Champagne. He thought it impossible that

Vol. X.

2

Francis could resist so many unexpected attacks on such different quarters; but he found himself mistaken.

Spain.

108

The French monarch fixed upon the most effectual plan for defeating the invasion of a powerful enemy, and he prudently persevered in following it, though contrary to his own natural temper and to the genius of his people. He determined to remain altogether upon the defensive, and to deprive the enemy of subsistence by laying waste the country before them. The execution of this plan was committed to the marshal Montmorency its author, a man happily fitted for such a trust by the inflexible severity of his disposition. He made choice of a strong camp, under the walls of Avignon, at the confluence of the Rhone and Durance, where he assembled a considerable army; while the king, with another body of troops, encamped at Valence, higher up the Rhone. Marseilles and Arles were the only towns he thought it necessary to defend; and each of these he furnished with a numerous garrison of his best troops. The inhabitants of the other towns were compelled to abandon their habitations; the fortifications of such places as might have afforded shelter to the enemy were thrown down; corn, forage, and provisions of every kind were carried off or destroyed; the mills and ovens were ruined, and the wells filled up or rendered useless.

But is dis-
appointed
in his de-
signs.

This devastation extended from the Alps to Marseilles, and from the sea to the confines of Dauphiny; so that the emperor, when he arrived with the van of his army on the confines of Provence, instead of that rich and populous country which he expected to enter, beheld nothing but one vast and desert solitude. He did not, however, despair of success, though he saw that he would have many difficulties to encounter; and as an encouragement to his officers, he made them liberal promises of lands and honours in France. But all the land which any of them obtained was a grave, and their master lost much honour by this rash and presumptuous enterprise. After unsuccessfully investing Marseilles and Arles, after attempting in vain to draw Montmorency from his camp at Avignon, and not daring to attack it, Charles, having spent two inglorious months in Provence, and lost one half of his troops by disease or by famine, was under the necessity of ordering a retreat; and though he was some time in motion before the enemy suspected his intention, it was conducted with so much precipitation and disorder, as to deserve the name of a flight, since the light troops of France turned it into a perfect rout. The invasion of Picardy was not more successful; the imperial forces were obliged to retire without effecting any conquest of importance.

Charles had no sooner conducted the shattered remains of his army to the frontiers of Milan, than he set out for Genoa; and, unwilling to expose himself to the scorn of the Italians after such a reverse of fortune, he embarked directly for Spain.

109

Meanwhile Francis gave himself up to that vain resentment which had formerly disgraced the prosperity of his rival. They had frequently, in the course of their quarrels, given each other the lie, and mutual challenges had been sent; which, though productive of no serious consequences between the parties, had a powerful tendency to encourage the pernicious practice of duelling. Charles, in his invective pronounced

at Rome, had publicly accused Francis of perfidy and breach of faith; Francis now exceeded Charles in the indecency of his accusations. The Dauphin dying suddenly, his death was imputed to poison: Monteculi his cup-bearer was put to the rack; and that unhappy nobleman, in the agonies of torture, accused the emperor's generals, Gonzaga and de Leyva, of instigating him to the detestable act. The emperor himself was suspected; nay, this extorted confession, and some obscure hints, were considered as incontestable proofs of his guilt; though it was evident to all mankind, that neither Charles nor his generals could have any inducement to perpetrate such a crime, as Francis was still in the vigour of life himself, and had two sons besides the dauphin, grown up to a good age.

But the incensed monarch's resentment did not stop here. Francis was not satisfied with endeavouring to blacken the character of his rival by an ambiguous testimony which led to the most injurious suspicions, and upon which the most cruel constructions had been put; he was willing to add rebellion to murder. For this purpose he went to the parliament of Paris; where being seated with the usual solemnities, the advocate-general appeared, and accused Charles of Austria (so he affected to call the emperor) of having violated the treaty of Cambray, by which he was freed from the homage due to the crown of France for the counties of Artois and Flanders; adding, that this treaty being now void, he was still to be considered as a vassal of France, and consequently had been guilty of rebellion in taking arms against his sovereign. The charge was sustained, and Charles was summoned to appear before the parliament of Paris at a day fixed. The term expired; and no person appearing in the emperor's name, the parliament gave judgment, that Charles of Austria had forfeited, by rebellion and contumacy, the counties of Flanders and Artois, and declared these fiefs reunited to the crown of France.

Francis, soon after this vain display of his animosity, marched into the Low Countries, as if he had intended to execute the sentence pronounced by his parliament; but a suspension of arms took place, thro' the interposition of the queens of France and Hungary, before any thing of consequence was effected: and this cessation of hostilities was followed by a truce, concluded at Nice, through the mediation of the reigning pontiff Paul III. of the family of Farnese, a man of a venerable character and pacific disposition.

Each of these rival princes had strong reasons to incline them to peace. The finances of both were exhausted; and the emperor, the most powerful of the two, was deeply impressed with the dread of the Turkish arms, which Francis had drawn upon him by a league with Solymán. In consequence of this league, Barbarossa with a great fleet appeared on the coast of Naples; filled that kingdom with conflagration; landed without resistance near Taranto; obliged Castro, a place of some strength, to surrender; plundered the adjacent country; and was taking measures for securing and extending his conquests, when the unexpected arrival of Doria, the famous Genoese admiral, together with the pope's galleys and a squadron of the Venetian fleet, made it prudent for him to retire. The sultan's forces also invaded Hungary, where Mahmet the Turkish general, after gaining several inferior ad-

vantages, defeated the Germans in a great battle at Essek on the Drave. Happily for Charles and Europe, it was not in Francis's power, at this juncture, either to join the Turks or assemble an army strong enough to penetrate into the Milanese. The emperor, however, was sensible that he could not long resist the efforts of two such powerful confederates, nor expect that the same fortunate circumstances would concur a second time in his favour; he therefore thought it necessary, both for his safety and reputation, to give his consent to a truce: and Francis chose rather to run the risk of disobliging his new ally the sultan, than to draw on his head the indignation, and perhaps the arms of all Christendom, by obstinately obstructing the re-establishment of tranquillity, and contributing to the aggrandisement of the Infidels.

These considerations inclined the contending monarchs to listen to the arguments of the holy father; but he found it impossible to bring about a final accommodation between them, each inflexibly persisting in asserting his own claims. Nor could he prevail on them to see one another, though both came to the place of rendezvous: so great was the remains of distrust and rancour, or such the difficulty of adjusting the ceremonial! Yet, improbable as it may seem, a few days after signing the truce, the emperor, in his passage to Barcelona, being driven on the coast of Provence, Francis invited him to come ashore; frankly visited him on board his galley, and was received and entertained with the warmest demonstrations of esteem and affection. Charles, with an equal degree of confidence, paid the king next day a visit at Aigues-mortes; where these two hostile rivals and vindictive enemies, who had accused each other of every kind of baseness, conversing together with all the cordiality of brothers, seemed to vie with each other in expressions of respect and friendship.

Besides the glory of having restored tranquillity to Europe, the pope gained a point of much consequence to his family. He obtained for his grandson Margaret of Austria, the emperor's natural daughter, formerly wife of Alexander de Medici, whom Charles had raised to the supreme power in Florence. Lorenzo de Medici, the kinsman and intimate companion of Alexander, had assassinated him by one of the blackest treasons recorded in history. Under pretence of having secured him an assignation with a lady of the highest rank and great beauty, he drew him into a secret apartment of his house, and there stabbed him as he lay carelessly on a couch, expelling the embrace of the lovely fair, whom he had often solicited in vain. Lorenzo, however, did not reap the fruits of his crime; for though some of his countrymen extolled him as a third Brutus, and endeavoured to seize this occasion for recovering their liberties, the government of Florence passed into the hands of Cosmo II. another kinsman of Alexander. Cosmo was desirous of marrying the widow of his predecessor; but the emperor chose rather to oblige the pope, by bestowing his daughter upon Ottavio Farnese, son of the duke of Parma.

Charles had soon farther cause to be sensible of his obligations to the holy father for bringing about the treaty of Nice. His troops every where mutinied for

want of pay, and the ability of his generals only could have prevented a total revolt. He had depended, as his chief resource for discharging the arrears due to his soldiers, upon the subsidies which he expected from his Castilian subjects. For this purpose he assembled the cortes of Castile at Toledo; and having represented to them the great expence of his military operations, he proposed to levy such supplies as the present exigency of affairs demanded, by a general excise on commodities; but the Spaniards, who already felt themselves oppressed by a load of taxes unknown to their ancestors, and who had often complained that their country was drained of its wealth and inhabitants, in order to prosecute quarrels in which they had no interest, determined not to add voluntarily to their own burdens. The nobles, in particular, inveighed with great vehemence against the imposition proposed, as an encroachment on the valuable and distinguishing privilege of their order, that of being exempted from the payment of any tax. After employing arguments and promises in vain, Charles dismissed the assembly with indignation; and from that period neither the nobles nor the prelates have been called to the Cortes, on pretence that such as pay no part of the public taxes should not claim a vote in laying them on. These assemblies have since consisted merely of the procurators or representatives of eighteen cities, two from each; in all thirty-six members, who are absolutely at the devotion of the crown.

117
Inhabitants
of Ghent
rebel.

The citizens of Ghent, still more bold, broke out not long after into open rebellion against the emperor's government, on account of a tax which they judged contrary to their ancient privileges, and a decision of the council of Mechlin in favour of the imperial authority. Enraged at an unjust imposition, and rendered desperate on seeing their rights betrayed by that very court which was bound to protect them, they flew to arms, seized several of the emperor's officers, and drove such of the nobility as resided among them out of the city. Sensible, however, of their inability to support what their zeal had prompted them to undertake, and desirous of securing a protector against the formidable forces with which they might expect soon to be attacked, they offered to acknowledge the king of France as their sovereign; and to put him into immediate possession of their city, and to assist him in recovering those provinces in the Netherlands which had anciently belonged to his crown. True policy directed Francis to comply with this proposal. The counties of Flanders and Artois were more valuable than the duchy of Milan, for which he had so long contended; and their situation in regard to France made it more easy to conquer or to defend them. But Francis over-rated the Milanese. He had lived in friendship with the emperor ever since their interview at Aigues-mortes, and Charles had promised him the investiture of that duchy. Forgetting, therefore, all his past injuries, and the deceitful promises by which he had been so often duped, the credulous, generous Francis, not only rejected the propositions of the citizens of Ghent, but communicated to the emperor his whole negotiation with the malcontents.

118
Extreme
credulity of
Francis.

Judging of Charles's heart by his own, Francis hoped by this seemingly disinterested proceeding to obtain at once the investiture of Milan; and the em-

peror, well acquainted with the weakness of his rival, flattered him in this apprehension, for his own selfish purposes. His presence being necessary in the Netherlands, he demanded a passage through France. It was immediately granted him; and Charles, to whom every moment was precious, set out, notwithstanding the remonstrances of his council and the fears of his Spanish subjects, with a small but splendid train of 100 persons. He was met on the frontiers of France by the dauphin and the duke of Orleans, who offered to go into Spain, and remain there as hostages, till he should reach his own dominions; but Charles replied, that the king's honour was sufficient for his safety, and prosecuted his journey without any other security. The king entertained him with the utmost magnificence at Paris, and the two young princes did not take leave of him till he entered the Low Countries; yet he still found means to evade his promise, and Francis continued to believe him sincere.

119
He allows
Charles to
pass thro'
his domi-
nions.

The citizens of Ghent, alarmed at the approach of the emperor, who was joined by three armies, sent ambassadors to implore his mercy, and offered to throw open their gates. Charles only condescended to reply, "that he would appear among them as a sovereign and a judge, with the sceptre and the sword." He accordingly entered the place of his nativity on the anniversary of his birth; and instead of that lenity which might have been expected, exhibited an awful example of his severity. Twenty-six of the principal citizens were put to death; a greater number were banished; the city was declared to have forfeited its privileges; a new system of laws and political administration was prescribed; and a large fine was imposed on the inhabitants, in order to defray the expence of erecting a citadel, together with an annual tax for the support of a garrison. They were not only despoiled of their ancient immunities, but made to pay, like conquered people, for the means of perpetuating their own slavery.

Having thus re-established his authority in the Low Countries, and being now under no necessity of continuing that scene of falsehood and dissimulation of which he had amused the French monarch, Charles began gradually to throw aside the veil under which he had concealed his intentions with respect to the Milanese, and at last peremptorily refused to give up a territory of such value, or voluntarily to make such a liberal addition to the strength of an enemy by diminishing his own power. He even denied that he had ever made any promise which could bind him to an action so foolish, and so contrary to his own interest.

121
His base
treatment
of Francis.

This transaction exposed the king of France to as much scorn as it did the emperor to censure. The credulous simplicity of Francis seemed to merit no other return, after experiencing so often the duplicity and artifices of his rival. He remonstrated, however, and exclaimed as if this had been the first circumstance in which the emperor had deceived him. The insult offered to his understanding affected him even more sensibly than the injury done to his interest; and he discovered such resentment as made it obvious that he would seize on the first opportunity of revenge, and that a new war would soon desolate the European continent.

Spain.

122
He is ob-
liged to
make con-
cessions to
the Prote-
stants.

Meanwhile Charles was obliged to turn his attention towards the affairs of Germany. The Protestants having in vain demanded a general council, pressed him earnestly to appoint a conference between a select number of divines of each party, in order to examine the points in dispute. For this purpose a diet was assembled at Ratibon : and such a conference, notwithstanding the opposition of the pope, was held with great solemnity in the presence of the emperor. But the divines chosen to manage the controversy, though men of learning and moderation, were only able to settle a few speculative opinions, all points relative to worship and jurisdiction serving only to inflame the minds of the disputants. Charles, therefore, finding his endeavours to bring about an accommodation ineffectual, and being impatient to close the diet, prevailed on a majority of the members to approve of the following edict of recess; viz. That the articles concerning which the divines had agreed, should be held as points decided; that those about which they had differed, should be referred to the determination of a general council, or if that could not be obtained, to a national synod; and should it prove impracticable also to assemble a synod of Germany, that a general diet of the empire should be called within 18 months, in order to give final judgment on the whole controversy; that, in the mean time, no innovations should be attempted, nor any endeavours employed to gain proselytes.

This diet gave great offence to the pope. The bare mention of allowing a diet, composed chiefly of laymen, to pass judgment in regard to articles of faith, appeared to him no less criminal and profane than the worst of those heresies which the emperor seemed so zealous to suppress. The Protestants also were dissatisfied with it, as it considerably abridged the liberty which they at that time enjoyed. They murmured loudly against it; and Charles, unwilling to leave any seeds of discontent in the empire, granted them a private declaration, exempting them from whatever they thought injurious or oppressive in the recess, and ascertaining to them the full possession of all their former privileges.

The situation of the emperor's affairs at this juncture made these extraordinary concessions necessary. He foresaw a rupture with France to be unavoidable, and he was alarmed at the rapid progress of the Turks in Hungary. A great revolution had happened in that kingdom. John Zapol Scæpus, by the assistance of Solymán, had wrested from the king of the Romans a considerable part of the country. John died, and left an infant son. Ferdinand attempted to take advantage of the minority, in order to repossess himself of the whole kingdom; but his ambition was disappointed by the activity and address of George Martinuzzi, bishop of Waradin, who shared the regency with the queen. Sensible that he was unable to oppose the king of the Romans in the field, Martinuzzi satisfied himself with holding out the fortified towns, all of which he provided with every thing necessary for defence: and at the same time he sent ambassadors to Solymán, beseeching him to extend towards the son that imperial protection which had so generously maintained the father on his throne. Ferdinand used his utmost endeavours to thwart this negotiation, and even meanly of-

fered to hold the Hungarian crown on the same ignominious condition by which John had held it, that of paying tribute to the porte. But the sultan saw such advantages from espousing the interest of the young king, that he instantly marched into Hungary; and the Germans, having formed the siege of Buda, were defeated with great slaughter before that city. Solymán, however, instead of becoming the protector of the infant-sovereign whom he had relieved, made use of this success to extend his own dominions: he sent the queen and her son into Transilvania, which province he allotted them, and added Hungary to the Ottoman empire.

Happily for the Protestants, Charles received intelligence of this revolution soon after the diet at Ratibon; and by the concessions which he made them, he obtained such liberal supplies, both of men and money, as left him under little anxiety about the security of Germany. He therefore hastened to join his fleet and army in Italy, in order to carry into execution a great and favourite enterprise which he had concerted against Algiers; though it would certainly have been more consistent with his dignity to have conducted the whole force of the empire against Solymán, the common enemy of Christendom, who was ready to enter his Austrian dominions. But many reasons induced Charles to prefer the African expedition: he wanted strength, or at least money, to combat the Turks in so distant a country as Hungary; and the glory which he had formerly acquired in Barbary led him to hope for the like success, while the cries of his Spanish subjects roused him to take vengeance on their ravagers. But the unfortunate event of this expedition has already been related under the article ALGIERS, n^o 14—20.

The loss which the emperor suffered in this calamitous expedition encouraged the king of France to begin hostilities, on which he had been for some time resolved; and an action dishonourable to civil society furnished him with too good a pretext for taking arms. The marquis del Guasto, governor of the Milanese, having got intelligence of the motions and destination of two ambassadors, Rineon and Pergoso, whom Francis had dispatched, the one to the Ottoman porte, the other to the republic of Venice; knowing how much his master wished to discover the intentions of the French monarch, and of what consequence it was to retard the execution of his measures, he employed some soldiers belonging to the garrison of Pavia to lie in wait for these ambassadors as they sailed down the Po, who murdered them and most of their attendants, and seized their papers. Francis immediately demanded reparation for this barbarous outrage; and as Charles endeavoured to put him off with an evasive answer, he appealed to all the courts of Europe, setting forth the heinousness of the injury, the iniquity of the emperor in disregarding his just request, and the necessity of vengeance. But Charles, who was a more profound negotiator, defeated in a great measure the effects of these representations: he secured the fidelity of the Protestant princes in Germany, by granting them new concessions; and he engaged the king of England to espouse his cause, under pretence of defending Europe against the Infidels; while Francis was only able to form an alliance with the kings of Denmark and Swe-

Spain.

den,

Spain.

den, (who for the first time interested themselves in the quarrels of the more potent monarchs of the south), and to renew his treaty with Solymán, which drew on him the indignation of Christendom.

But the activity of Francis supplied all the defects of his negotiation. Five armies were soon ready to take the field, under different generals, and with different destinations. Nor was Charles wanting in his preparations. He and Henry a second time made an ideal division of the kingdom of France. But as the hostilities which followed terminated in nothing decisive, and were distinguished by no remarkable event, except the battle of Cerifoles (gained by count d'Enguieu over the imperialists, and in which 10,000 of the emperor's best troops fell), at last Francis and Charles, mutually tired of harassing each other, concluded at Crespy a treaty of peace, in which the king of England was not mentioned; and from being implacable enemies, became once more, to appearance, cordial friends, and even allies by the ties of blood.

115
Peace con-
cluded at
Crespy.

The chief articles of this treaty were, that all the conquests which either party had made since the truce of Nice should be restored; that the emperor should give in marriage to the duke of Orleans, either his own eldest daughter, with the Low Countries, or the second daughter of his brother Ferdinand, with the investiture of the Milanese; that Francis should renounce all pretensions to the kingdom of Naples, as well as to the sovereignty of Flanders and Artois, and Charles give up his claim to the duchy of Burgundy; and that both should unite in making war against the Turks.

The emperor was chiefly induced to grant conditions so advantageous to France, by a desire of humbling the Protestant princes in Germany. With the papal jurisdiction, he foresaw they would endeavour to throw off the imperial authority; and he determined to make his zeal for the former a pretence for enforcing and extending the latter. However, the death of the duke of Orleans before the consummation of his marriage, disentangled the emperor from the most troublesome stipulation in the treaty of Crespy; and that the French monarch, being still engaged in hostilities with England, was unable to obtain any reparation for the loss which he suffered by this unforeseen event. These hostilities, like those between Charles and Francis, terminated in nothing decisive. Equally tired of a struggle attended with no glory or advantage to either, the contending princes concluded, at Campe, near Ardies, a treaty of peace; in which it was stipulated, that France should pay the arrears due by former treaties to England. But these arrears did not exceed one-third of the sums expended by Henry on his military operations; and Francis being in no condition to discharge them; Boulogne (a chargeable pledge) was left in the hands of the English as a security for the debt.

126
Charles ob-
liged to
conclude a
disadvan-
tageous peace
with the
Turks and
Protestants.

In consequence of the emperor's resolution to humble the Protestant princes, he concluded a dishonourable peace with the Pope, stipulating that his brother Ferdinand should pay tribute for that part of Hungary which he still possessed; while the sultan enjoyed the imperial and undisturbed possession of all the rest. At the same time he entered into a league with pope

Spain.

Paul III. for the extirpation of heresy; but in reality with a view to oppress the liberties of Germany. Here, however, his ambition met with a severe check; for though he was successful at first, he was obliged, in 1552, to conclude a peace with the Protestants on their own terms; as has been related under the article REFORMATION, n° 26—32.

By the peace concluded on this occasion the emperor lost Metz, Toul, and Verdun, which had formed the barrier of the empire on that quarter; and therefore soon after put himself at the head of an army, in order to recover these three bishoprics. In order to conceal the destination of his army, he gave out, that he intended to lead it into Hungary, to second Maurice in his operations against the Infidels; and as that pretext failed him, when he began to advance towards the Rhine, he propagated a report that he was marching first to chastise Albert of Brandenburg, who had refused to be included in the treaty of Passau, and whose cruel exactions in that part of Germany called loudly for redress.

127
Attempts
to recover
some of his
provinces.

The French, however, were not deceived by these arts. Henry immediately guessed the true object of Charles's armament, and resolved to defend his conquests with vigour. The defence of Metz, against which it was foreseen the whole weight of the war would be turned, was committed to Francis of Lorraine, duke of Guise, who possessed in an eminent degree all the qualities that render men great in military command. He repaired with joy to the dangerous station; and many of the French nobility, and even princes of the blood, eager to distinguish themselves under such a leader, entered Metz as volunteers. The city was of great extent, ill fortified, and the suburbs large. For all these defects the duke endeavoured to provide a remedy. He repaired the old fortifications with all possible expedition, labouring with his own hands; the officers imitated his example; and the soldiers, thus encouraged, cheerfully submitted to the most severe toils; he erected new works, and he levelled the suburbs with the ground. At the same time he filled the magazines with provisions and military stores, compelled all useless persons to leave the place, and laid waste the neighbouring country; yet such were his popular talents, as well as his arts of acquiring an ascendant over the minds of men, that the citizens not only refrained from murmuring, but seconded him with no less ardour than the soldiers in all his operations—in the ruin of their estates, and in the havoc of their public and private buildings.

128
Is obliged
to raise the
siege of
Metz.

Meanwhile the emperor continued his march towards Lorraine, at the head of 60,000 men. On his approach, Albert of Brandenburg, whose army did not exceed 20,000, withdrew into that principality, as if he intended to join the French king; and Charles, notwithstanding the advanced season, it being towards the end of October, laid siege to Metz, contrary to the advice of his most experienced officers.

The attention of both the besiegers and the besieged was turned for some time towards the motions of Albert, who still hovered in the neighbourhood, undetermined which side to take, though resolved to sell his service. Charles at last came up to his price, and he joined the imperial army. The emperor now

bat-

Spain.

flattered himself that nothing could resist his force; but he found himself deceived. After a siege of almost 60 days, during which he had attempted all that was thought possible for art or valour to effect, and had lost upwards of 30,000 men by the inclemency of the weather, diseases, or the sword of the enemy, he was obliged to abandon the enterprise.

129
Miserable
condition of
his army.

When the French failed out to attack the enemy's rear, the imperial camp was filled with the sick and wounded, with the dead and the dying. All the roads by which the army retired were strewn with the same miserable objects; who, having made an effort beyond their strength to escape, and not being able to proceed, were left to perish without assistance. Happily that, and all the kind offices which their friends had not the power to perform, they received from their enemies. The duke of Guise ordered them all to be taken care of, and supplied with every necessary; he appointed physicians to attend, and direct what treatment was proper for the sick and wounded, and what refreshments for the feeble; and such as recovered he sent home, under an escort of soldiers, and with money to bear their charges. By these acts of humanity, less common in that age, the duke of Guise completed that heroic character which he had justly acquired by his brave and successful defence of Metz.

130
His further
misfortunes

The emperor's misfortunes were not confined to Germany. During his residence at Villach, he had been obliged to borrow 200,000 crowns of Cosmo de Medici; and so low was his credit, that he was obliged to put Cosmo in possession of the principality of Piombino as a security for that considerable sum; by which means he lost the footing he had hitherto maintained in Tuscany. Much about the same time he lost Siena. The citizens, who had long enjoyed a republican government, rose against the Spanish garrison, which they had admitted as a check upon the tyranny of the nobility, but which they found was meant to enslave them; forgetting their domestic animosities, they recalled the exiled nobles; they demolished the citadel, and put themselves under the protection of France.

To these unfortunate events one still more fatal had almost succeeded. The severe administration of the viceroy of Naples had filled that kingdom with murmuring and dissatisfaction. The prince of Salerno, the head of the malcontents, fled to the court of France. The French monarch, after the example of his father, applied to the grand seignior; and Solyman, at that time highly incensed against the house of Austria on account of the proceedings in Hungary, sent a powerful fleet into the Mediterranean, under the command of the corsair Dragut, an officer trained up under Barbarossa, and scarce inferior to his master in courage, talents, or in good fortune. Dragut appeared on the coast of Calabria at the time appointed; but not being joined by the French fleet according to concert, he returned to Constantinople, after plundering and burning several places, and filling Naples with consternation.

131
Is successful in
the Low Coun-
tries.

Highly mortified by so many disasters, Charles retired into the Low Countries, breathing vengeance against France: and here the war was carried on with considerable vigour. Impatient to efface the

Spain.

stain which his military reputation had received before Metz, Charles laid siege to Terouane; and the fortifications being in disrepair, that important place was carried by assault. Hefdin also was invested, and carried in the same manner. The king of France was too late in assembling his forces, to afford relief to either of these places; and the emperor afterwards cautiously avoided an engagement.

The imperial arms were less successful in Italy. But not so the viceroy of Naples failed in an attempt to recover ¹³² ^{But not so} Siena; and the French not only established themselves ^{in other} ^{places.} more firmly in Tuscany, but conquered part of the island of Corsica. Nor did the affairs of the house of Austria go on better in Hungary during the course of this year. Isabella and her son appeared once more in Transylvania, at a time when the people were ready for revolt, in order to revenge the death of Martinuzzi, whose loss they had severely felt. Some noblemen of eminence declared in favour of the young king; and the bashaw of Belgrade, by Solyman's order, espousing his cause, in opposition to Ferdinand, Castaldo, the Austrian general, was obliged to abandon Transylvania to Isabella and the Turks.

In order to counterbalance these and other losses, ¹³³ ^{Marriage} the emperor, in 1554, concerted a marriage between ^{between} his son Philip and Mary of England, in hopes of add- ^{Philip of} ^{Spain and} ^{Mary of} ^{England,} ing that kingdom to his other dominions. Meanwhile the war between Henry and Charles was carried on with various success in the Low Countries, and in Italy much to the disadvantage of France. The French, under the command of Strozzi, were defeated in the battle of Merciano; Siena was reduced by Medicino, the Florentine general, after a siege of ten months; and the gallant Siense were subjected to the Spanish yoke. Much about the same time a plot was formed by the Franciscans, but happily discovered before it could be carried into execution, to betray Metz to the Imperialists. The father-guardian, and twenty other monks, received sentence of death on account of this conspiracy; but the guardian, before the time appointed for his execution, was murdered by his incensed accomplices, whom he had seduced; and six of the youngest were pardoned.

While war thus raged in Italy and the Low Countries, Germany enjoyed such profound tranquillity, as afforded the diet full leisure to confirm and perfect the plan of religious pacification agreed upon at Passau, and referred to the consideration of the next meeting of the Germanic body. During the negotiation of this treaty, an event happened which astonished all Europe, and confounded the reasonings of the wisest politicians. The emperor Charles V. though no more than 56, an age when objects of ambition operate with full force on the mind, and are generally pursued with the greatest ardour, had for some time formed the resolution of resigning his hereditary dominions to his son Philip. He now determined to put it in execution. Various have been the opinions of historians concerning a resolution so singular and unexpected; but the most probable seem to be, the disappointments which Charles had met with in his ambitious hopes, and the daily decline of his health. He had early in life been attacked with the gout; and the fits were now become so frequent and severe, that not only the vigour of his constitution was broken, but the cal-
¹³⁴ ^{Charles re-} ^{signs his} ^{dominions} ^{to his son} ^{Philip.}

Spain.

culties of his mind were sensibly impaired. He therefore judged it more decent to conceal his infirmities in some solitude, than to expose them any longer to the public eye; and as he was unwilling to forfeit the fame, or lose the acquisitions of his better years, by attempting to guide the reins of government when he was no longer able to hold them with steadiness, he prudently determined to seek in the tranquillity of retirement, that happiness which he had in vain pursued amid the tumults of war and the intrigues of state.

In consequence of this resolution, Charles, who had already ceded to his son Philip the kingdom of Naples and the duchy of Milan, assembled the states of the Low Countries at Brussels; and seating himself for the last time in the chair of state, he explained to his subjects the reasons of his resignation, and solemnly devolved his authority upon Philip. He recounted with dignity, but without ostentation, all the great things which he had undertaken and performed since the commencement of his administration. "I have dedicated," observed he, "from the 17th year of my age, all my thoughts and attention to public objects, reserving no portion of my time for the indulgence of ease, and very little for the enjoyment of private pleasure. Either in a pacific or hostile manner, I have visited Germany nine times, Spain six times, France four times, Italy seven times, the Low Countries ten times, England twice, Africa as often; and while my health permitted me to discharge the duty of a sovereign, and the vigour of my constitution was equal in any degree to the arduous office of governing such extensive dominions, I never shunned labour, nor repined under fatigue; but now, when my health is broken, and my vigour exhausted by the rage of an incurable distemper, my growing infirmities admonish me to retire; nor am I so fond of reigning, as to retain the sceptre in an impotent hand, which is no longer able to protect my subjects. Instead of a sovereign worn out with diseases," continued he, "and scarce half alive, I give you one in the prime of life, already accustomed to govern, and who adds to the vigour of youth all the attention and sagacity of maturer years." Then turning towards Philip, who fell on his knees, and kissed his father's hand, "It is in your power," said Charles, "by a wise and virtuous administration, to justify the extraordinary proof which I give this day of my paternal affection, and to demonstrate that you are worthy of the extraordinary confidence which I repose in you. Preserve," added he, "an inviolable regard for religion; maintain the catholic faith in its purity; let the laws of your country be sacred in your eyes; encroach not on the rights of your people; and if the time should ever come when you shall wish to enjoy the tranquillity of private life, may you have a son to whom you can resign your sceptre with as much satisfaction as I give up mine to you." A few weeks after, he resigned to Philip the sovereignty of Spain and America; reserving nothing to himself out of all these vast possessions but an annual pension of 100,000 crowns.

Charles was now impatient to embark for Spain, where he had fixed on a place of retreat; but by the advice of his physicians, he put off his voyage for some months, on account of the severity of the season;

and, by yielding to their judgment, he had the satisfaction, before he left the Low Countries, of taking a considerable step towards a peace with France. This he ardently longed for; not only on his son's account, whose administration he wished to commence in quietness, but that he might have the glory, when quitting the world, of restoring to Europe that tranquillity which his ambition had banished out of it, almost from the time that he assumed the reins of government.

The great bar to such a pacification, on the part of France, was the treaty which Henry had concluded with the Pope; and the emperor's claims were too numerous to hope for adjusting them suddenly. A truce of five years was therefore proposed by Charles; during which term, without discussing their respective pretensions, each should retain what was in his possession; and Henry, through the persuasion of the confident Montmorency, who represented the imprudence of sacrificing the true interests of his kingdom to the rash engagements that he had come under with Paul, authorised his ambassadors to sign at Vaucelles a treaty, which would insure to him, for so considerable a period, the important conquest which he had made on the German frontier, together with the greater part of the duke of Savoy's dominions.

The Pope, when informed of this transaction, was no less filled with terror and astonishment than rage and indignation. But he took equal care to conceal his fear and his anger. He affected to approve highly of the truce; and he offered his mediation, as the common father of Christendom, in order to bring about a definitive peace. Under this pretext, he appointed cardinal Rebibio his nuncio to the court of Brussels, and his nephew cardinal Caffara to that of Paris. The public instructions of both were the same; but Caffara, besides these, received a private commission, to spare neither intreaties, promises, nor bribes, in order to induce the French monarch to renounce the truce and renew his engagements with the holy see. He flattered Henry with the conquest of Naples; he gained by his address the Guises, the queen, and even the famous Diana of Poitiers, duchess of Valentinois, the king's mistress; and they easily swayed the king himself, who already leaned to that side towards which they wished to incline him. All Montmorency's prudent remonstrances were disregarded; the nuncio (by powers from Rome) absolved Henry from his oath of truce; and that weak prince signed a new treaty with the Pope; which rekindled with fresh violence the flames of war, both in Italy and the Low Countries.

No sooner was Paul made acquainted with the success of this negotiation, than he proceeded to the most violent exertions against Philip. He ordered the Spanish ambassador to be imprisoned; he excommunicated the Colonnas, because of their attachment to the imperial house; and he considered Philip as guilty of high-treason, and to have forfeited his right to the kingdom of Naples, which he was supposed to hold of the holy see, for afterward affording them a retreat in his dominions.

Alarmed at a quarrel with the pope, whom he had been taught to regard with the most superstitious veneration, as the viceregent of Christ and the com-

Quarrel between the pope and King Philip.

Spain.

mon father of Christendom, Philip tried every gentle method before he made use of force. He even consulted some Spanish divines on the lawfulness of taking arms against a person so sacred. They decided in his favour; and Paul continuing inexorable, the duke of Alva, to whom the negotiations as well as the war had been committed, entered the ecclesiastical state at the head of 10,000 veterans, and carried terror to the gates of Rome.

The haughty pontiff, though still inflexible and undaunted in himself, was forced to give way to the fears of the cardinals, and a truce was concluded for 40 days. Meantime the duke of Guise arriving with a supply of 20,000 French troops, Paul became more arrogant than ever, and banished all thoughts from his mind but those of war and revenge. The duke of Guise, however, who had precipitated his country into this war, chiefly from a desire of gaining a field where he might display his own talents, was able to perform nothing in Italy worthy of his former fame. He was obliged to abandon the siege of Civitella; he could not bring the duke of Alva to a general engagement; his army perished by diseases; and the Pope neglected to furnish the necessary reinforcements. He begged to be recalled; and France stood in need of his abilities.

Philip, though willing to have avoided a rupture, was no sooner informed that Henry had violated the truce of Vaucelles, than he determined to act with such vigour, as should convince Europe that his father had not erred in resigning to him the reins of government. He immediately assembled in the Low Countries a body of 50,000 men, and obtained a supply of 10,000 from England, which he had engaged in his quarrel; and as he was not ambitious of military fame, he gave the command of his army to Emanuel Philibert duke of Savoy, one of the greatest generals of that warlike age.

The duke of Savoy kept the enemy for some time in suspense with regard to his destination; at last he seemed to threaten Champagne; towards which the French drew all their troops; then turning suddenly to the right, he advanced by rapid marches into Picardy, and laid siege to St Quintin. It was deemed in those times a town of considerable strength; but the fortifications had been much neglected, and the garrison did not amount to a fifth part of the number requisite for its defence: it must therefore have surrendered in a few days, if the admiral de Coligny had not taken the gallant resolution of throwing himself into it with such a body of men as could be collected on a sudden. This he effected in spite of the enemy, breaking through their main body. The place, however, was closely invested; and the constable Montmorency, anxious to extricate his nephew out of that perilous situation, in which his zeal for the public had engaged him, as well as to save a town of such importance, rashly advanced to its relief with forces one half inferior to those of the enemy. His army was cut in pieces, and he himself made prisoner.

The cautious temper of Philip on this occasion saved France from desolation, if not ruin. The duke of Savoy proposed to overlook all inferior objects, and march speedily to Paris, which, in its present consternation, he could not have failed to make

himself master of; but Philip, afraid of the consequences of such a bold enterprise, desired him to continue the siege of St Quintin, in order to secure a safe retreat in case of any disastrous event. The town, long and gallantly defended by Coligny, was at last taken by storm; but not till France was in a state of defence.

Philip was now sensible that he had lost an opportunity which could never be recalled, of distressing his enemy, and contented himself with reducing Horn and Catelet; which petty towns, together with St Quintin, were the sole fruits of one of the most decisive victories gained in the 16th century. The Catholic king, however, continued in high exultation on account of his success; and as all his passions were tinged with superstition, he vowed to build a church, a monastery, and a palace, in honour of St Laurence, on the day sacred to whose memory the battle of St Quintin had been fought. He accordingly laid the foundation of an edifice, in which all these were included, and which he continued to forward at vast expence, for 22 years. The same principle which dictated the vow directed the building. It was so formed as to resemble a gridiron—on which culinary instrument, according to the legendary tale, St Laurence had suffered martyrdom. Such is the origin of the famous escorial near Madrid, the royal residence of the kings of Spain.

The first account of that fatal blow which France had received at St Quintin, was carried to Rome by the courier whom Henry had sent to recal the duke of Guise. Paul remonstrated warmly against the departure of the French army; but Guise's orders were peremptory. The arrogant pontiff therefore found it necessary to accommodate his conduct to the exigency of his affairs, and to employ the mediation of the Venetians, and of Cosmo de Medici, in order to obtain peace. The first overtures of this nature were eagerly listened to by the Catholic king, who still doubted the justice of his cause, and considered it as his greatest misfortune to be obliged to contend with the pope. Paul agreed to renounce his league with France; and Philip stipulated on his part, that the duke of Alva should repair in person to Rome, and after asking pardon of the holy father in his own name and in that of his master, for having invaded the patrimony of the church, should receive absolution from that crime.—Thus Paul, through the superstitious timidity of Philip, only finished an unpropitious war not without any detriment to the apostolic see, but saw his conqueror humbled at his feet: and so excessive was the veneration of the Spaniards in that age for the papal character, that the duke of Alva, the proudest man perhaps of his time, and accustomed from his infancy to converse with princes, acknowledged, that when he approached Paul, he was so much overawed, that his voice failed, and his presence of mind forsook him.

But though this war, which at its commencement threatened mighty revolutions, was terminated without occasioning any alteration in those states which were its immediate object, it produced effects of considerable consequence in other parts of Italy. In order to detach Octavio Farnese, duke of Parma, from the French interest, Philip restored to him the city of Placentia and its territory, which had been seized by Charles V. and he granted to Cosmo de Medici the

Spain. investiture of Sienna, as an equivalent for the fums due to him. By these treaties, the balance of power among the Italian states was poised with more equality, and rendered less variable than it had been since it received the first violent shock from the invasion of Charles VIII. and Italy henceforth ceased to be the theatre on which the monarchs of Spain, France, and Germany, contended for fame and dominion. Their hostilities, excited by new objects, flained other regions of Europe with blood, and made other states feel, in their turn, the miseries of war.

140
The French
unsuccessful
in the Low
Countries.

The duke of Guise, who left Rome the same day that his adversary the duke of Alba made his humiliating submission to the pope, was received in France as the guardian-angel of the kingdom. He was appointed lieutenant-general in chief, with a jurisdiction almost unlimited; and, eager to justify the extraordinary confidence which the king had reposed in him, as well as to perform something suitable to the high expectations of his countrymen, he undertook, in winter, the siege of Calais. Having taken that place, he next invested Thionville in the duchy of Luxembourg, one of the strongest towns on the frontiers of the Netherlands; and forced it to capitulate, after a siege of three weeks. But the advantages on this quarter were more than balanced by an event which happened in another part of the Low Countries. The marshal de Termes governor of Calais, who had penetrated into Flanders and taken Dunkirk, was totally routed near Gravelines, and taken prisoner by count Egmont. This disaster obliged the duke of Guise to relinquish all his other schemes, and hasten towards the frontiers of Picardy, that he might there oppose the progress of the enemy.

The eyes of all France were now turned towards the duke of Guise, as the only general on whose arms victory always attended, and in whose conduct as well as good fortune they could confide in every danger. His strength was nearly equal to the duke of Savoy's, each commanding about 40,000 men. They encamped at the distance of a few leagues from one another; and the French and Spanish monarchs having joined their respective armies, it was expected that, after the vicissitudes of war, a decisive battle would at last determine which of the rivals should take the ascendant for the future in the affairs of Europe. But both monarchs, as if by agreement, stood on the defensive; neither of them discovering any inclination, though each had it in his power, to rest the decision of a point of such importance on the issue of a single battle.

141
Peace con-
cluded be-
tween Hen-
ry and
Philip.

During this state of inaction, peace began to be mentioned in each camp, and both Henry and Philip discovered an equal disposition to listen to any overture that tended to re-establish it. The private inclinations of both kings concurred with their political interests and the wishes of their people. Philip languished to return to Spain, the place of his nativity; and peace only could enable him, either with decency or safety, to quit the Low Countries. Henry was now desirous of being freed from the avocations of war, that he might have leisure to turn the whole force of his government towards suppressing the opinions of the reformers, which were spreading with such rapidity in Paris and the other great towns, that they began to grow formidable to the established church. Court-in-

VOL. X.

trigues conspired with these public and avowed motives to hasten the negotiation, and the abbey of Cerpamp was fixed on as the place of congress.

While Philip and Henry were making these advances towards a treaty which restored tranquillity to Europe, Charles V. whose ambition had so long disturbed it, but who had been for some time dead to the world, ended his days in the monastery of St Justus in Eltre madura, which he had chosen as the place of his retreat, as is particularly related under the article CHARLES V.

142
Death of
Charles V.

After the death of Charles, the kingdom of Spain soon lost great part of its consequence. Though Charles had used all his interest to get his son Philip elected emperor of Germany, he had been totally disappointed; and thus the grandeur of Philip II. never equalled that of his father. His dominions were also considerably abridged by his tyrannical behaviour in the Netherlands.

In consequence of this, the United Provinces revolted; and after a long and bloody war obtained their liberty*. In this quarrel Elizabeth of England took part against Philip, which brought on a war with Spain. The great losses he sustained in these wars exhausted the kingdom both of men and money, notwithstanding the great fums imported from America. Indeed, the discovery and conquest of that country hath much impoverished, instead of enriching, Spain; for thus the inhabitants have been rendered lazy and averse from every kind of manufacture or traffic, which only can be a durable source of riches and strength to any nation. The ruin of the kingdom in this respect, however, was completed by Philip III. of the who, at the instigation of the inquisition, and by the advice of his prime minister the duke of Lerma, expelled from the kingdom all the Moreos or Moors, descendants of the ancient conquerors of Spain. Thirty days only were allowed them to prepare for their departure, and it was death to remain beyond that time. The reason for this barbarous decree was, that these people were still Mahometans in their hearts, though they conformed externally to the rites of Christianity, and thus might corrupt the true faith. The Moreos, however, chose themselves a king, and attempted to oppose the royal mandate; but, being almost entirely unprovided with arms, they were soon obliged to submit, and all banished the kingdom. By this violent and impolitic measure, Spain lost almost a million of industrious inhabitants; and as the kingdom was already depopulated by bloody wars, by repeated emigrations to America, and enervated by luxury, it now sunk into a state of languor from whence it has never recovered.

144
Expulsion
of the
Moors, and
its bad con-
sequences to
Spain.

In consequence of this languor and the mal-administration of the Spanish governors, Portugal, which had been reduced by Philip II. revolted, and has ever since been an independent kingdom†. However, the memory of what Spain once was, remained for a considerable time, and the power of that kingdom long continued to be feared after it had ceased to be powerful. In the time of queen Anne, a British army was seen for the first time in Spain, in order to support Charles of Austria against Philip the grandson of Louis XIV. The ill success of that attempt is related under the article BRITAIN n° 353—359; and thus the crown of Spain fell to a branch of the house of Bourbon, in consequence of

tugal, n° 18,
et seq.

41 F

which

Spain. which the courts of France and Spain have ever since acted in concert. Their wars with Britain are related under that article, n° 398. *et seq*; and these, with a late unsuccessful attempt on Algiers, constitute the most important part of the Spanish history to the present time.

146 Air and climate of Spain. The air of Spain, during the months of June, July, and August, is excessively hot in the day-time; but the rest of the year it is pleasant and temperate. Even during the above months it is very cool in the shade; and so cold in the night, that it makes a traveller shiver; and in the day-time the violent heat continues only for about four or five hours. In the north, on the mountains, and near the sea-coast, the air is much less sultry in summer than in the south, especially in the lower parts of the country, and at a distance from the sea. It seldom rains here, except about the equinoxes: the frosts are very gentle towards the south but on the mountains in the north and north-east, the air is very sharp in winter.

147 Soil and produce. Though there are some sandy barren deserts in the south, and many barren mountains in the north, yet in the greater part of the country, particularly in the valleys and plains, the soil is good, producing a great variety of rich wines, oil, and fruits; such as oranges, lemons, prunes, citrons, almonds, raisins, dates, figs, chestnuts, pomegranates, capers, pears, and peaches; but not a sufficiency of grain, which is chiefly owing to the neglect of tillage. Wheat and barley are the most common grain; the former of which is said by some to be the best in Europe. There is not much flax, hemp, oats, or hay, in Spain: but there is plenty of honey, salt, fine wool, silk, and cotton; and, in some places, of rice and sugar-canes. Here also are abundance of mules, and, in some provinces, of horses, together with deer, wild-fowl, and other game, chamois and other goats, but few horned cattle. Wolves are almost the only wild beasts in the country. The herb kali, which is used in making salt, soap, and glass, grows in great plenty on the sea-shore. The wild bulls, used in their bull-fights, are bred in Andalusia. The seas about Spain are well stored with fish; among which is the anchovy, in the Mediterranean. We may guess at the number of sheep here by that of the shepherds, which is said to be about forty thousand. The sheep that bear the fine wool move regularly, every summer, from south to north, along the mountains, which yield a great variety of sweet-herbs and plants, and return again towards winter. During this progress, large quantities of salt are distributed among them, and all possible care is taken both of their health and fleeces.

148 Mountains, minerals, &c. The chief mountains are the Pyrenes, which stretch from the Mediterranean to the Atlantic Ocean, but not in a direct line, for near 200 miles: their breadth is, in some places, not less than 80. That called the *Pic de Midi* is of a prodigious height. Over these mountains there are only about five passages out of Spain into France, and these also narrow; even the valleys between the mountains are covered with thick and lofty woods. The other chains in Spain are the Sierra d'Occa, Sierra Molino, Sierra Moreno, and Sierra Novada or the snowy mountains. Near Gibraltar, opposite to Mount Abyla in Africa, stands the celebrated Mount Calpe: these were anciently called

Heracles's pillars. The mountains yield great quantities of timber for shipping, which are conveyed by the Ebro and other rivers to the Mediterranean. According to the ancient and modern writers, they abound also with gold, silver, iron, lead, tin, cinnabar, quicksilver, alum, vitriol, copperas, lapis calaminaris, &c. besides gems, and mineral waters both hot and cold. The gold and silver mines are not worked at present, but those of iron are. The neglect of the former is owing partly to the indolence of the Spaniards, and partly to the gold and silver imported from America. Besides the rivers Minho, Douro, Tagus, Monda, Lima, and Guadiana, mentioned in Portugal, but which have their sources in Spain, the most considerable are the Ebro, Olim Iberus, Guadalquivir or Turiro, Guadalquivir, Olim Perea Bactis and Tartessus, Segura, and Zucar.

The Spaniards are jealous Romanists. Nowhere is there more pomp, farce, and parade, in what regards religion; and no where less true Christianity. Their zeal and their superstition exceed that of any other Roman-Catholic country, unless perhaps we should except Portugal. Nowhere did the inquisition reign with greater terror; there being no subject who was not liable to be prosecuted by the *holy office*, as it is called; however, the powers of that tribunal are now greatly diminished even in Spain. There are eight archbishops in Spain, seven in America, and one in Asia, at Manilla; each of which has his suffragan bishops. The archbishop of Toledo is primate, chancellor of Castile, and, by virtue of his office, privy-counsellor. He is said to have a revenue of 100,000 l. Sterling *per annum*, or more. The king nominates all archbishops and bishops; and, since 1753, all small benefices are also in his gift. He has also lately obtained a power to tax ecclesiastical possessions, according to his pleasure and the exigency of affairs. Though the rest of the nation is poor, the clergy are immensely rich, and their revenues of all kinds amazingly great. Most of the towns and estates belong to them, and are exempt from all public burdens; yet their avarice is insatiable, especially that of the Mendicant friars, though they profess poverty. Their commerce, which is free from all duties and imposts, is also a rich fund to them. Though the Spaniards are naturally men of wit and an elevated genius, yet little progress in the sciences is to be expected from them, while the clergy use their utmost efforts to keep them in ignorance, branding all literary researches with the name of heresy, and inveighing against the seats of the muses, as the schools of hell, where the devil teaches sorcery. There are 22 universities, and several academies, in Spain; but so constituted, and under such restrictions, that they can never attain to any measure of true learning. There are few printing-houses in Spain, and most of the books in that language are published in other countries.

In regard to trade and manufactures, the Spaniards Trade and are far from making such a figure as might be expected. Most of the laborious work in their husbandry, manufactures, and handicrafts, is performed by the French, especially in the two Castiles and the midland provinces, the natives being either too lazy or too proud to stoop to such employments. By these means, the French usually return with large fortunes to their

Spain.

own country. The chief manufactures of Spain are those of silk, wool, iron, copper, and other hardwares; but these fall far short of the flourishing condition they might be brought to: hence a great part of the treasures of America go to the foreign merchants, who supply them with goods for that part of the world. However, it is certain, that Spain, since it hath had princes of the house of Bourbon upon the throne, hath improved its revenues, increased its forces by sea and land, and applied itself more than it did before to manufactures and husbandry; having shaken off, in some measure, that idle indolent disposition which rendered it so contemptible in the eyes of other nations; but it will be a long time before they will be able to supply the wants of their own country, and those of America, in any great degree. Spain is extremely well situated for trade: but most of its produce is exported by foreigners, except what is carried to the Indies; and even with regard to that trade, they are little better than factors to the English, French, Dutch, and Italians. Smuggling, which was formerly carried to a great height, is now in a great measure suppressed. Since the year 1750, the exportation of silver hath been allowed on the payment of 3 per cent. From 1735 almost to 1756, the flotas and galleons were discontinued, and the trade to America carried on in register-ships, which any merchant might send, on permission obtained from the council of the Indies: but then the flotas and galleons were restored. The *Asfogue ships* are two vessels which carry quicksilver on the king's account to Vera Cruz. There is a company which has an exclusive grant for trading to the Caracas; and another for trading to Porto Rico, the Bay of Honduras, the province of Guatimala and Hispaniola; but the Spanish part of the last, it is said, hath been lately ceded to the French. One ship, and sometimes two, sails annually from Manilla, in the island of Luconia, one of the Philippines, for Acapulco, in Mexico: her cargo, which belongs to the convents, consists of the principal commodities of that part of the world; but the return from Acapulco is, for the most part, made in money, and amounts to a vast sum, as appeared from the treasure found on board the Acapulco ship taken by Lord Anson. In return for the manufactures sent to America, the Spaniards receive gold, silver, cochineal, indigo, the cocoa or chocolate nut, logwood and other dyeing woods, sugar, tobacco, snuff, and other productions of that part of the world; supplying most part of Europe and Asia with the silver they bring from thence in their galleons. In the time of the Moors and Goths, this kingdom was exceedingly populous. It is said to have then contained between twenty and thirty millions; whereas now it does not contain above seven or eight: and this, among other causes, is owing to the pride and laziness of the inhabitants, want of manufactures and good regulations, neglect of the mines and agriculture, the expulsion of the Moors, the peopling of America, heavy taxes, the great number of convents, excessive venery, and the consequent infecundity of both sexes. Their debauchery and sterility are partly occasioned by their way of living; for they make great use of spices, and drink a great deal of chocolate, and strong wine mixed with brandy. The causes assigned for the want of

Spain.

people in Spain will account, in some measure, for its poverty; notwithstanding it is computed that it receives one year with another, setting aside other sums, above twenty-six millions of pieces of eight, in registered gold and silver. As most of the manufactures that are sent to America are furnished by Britain, France, Italy, and Holland, to a great part of the treasure brought home by the galleons is paid to the merchants of those nations.

The constitution of Spain is at present an absolute hereditary monarchy, where the females inherit in default of the males. The king, in his title, enumerates most of the provinces and particular parts of the dominions he has been or is possessed of. In speaking of him, he is commonly called his *Catholic Majesty*, or the *Catholic King*. The hereditary prince is commonly styled *Prince of Asturias*, and the other royal children *Infants*. The kings of Spain are never crowned; they seem to have a power to dispose of the crown to what branch of the royal family they please. For the administration of the government and of justice, here are several councils and tribunals; as the *junto* or cabinet-council, the *privy-council*, the council of war, the council of Castile, the council of the inquisition, the council of the Indies, the seven courts of royal audiences, &c. Since the beginning of the 17th century, and the reign of Philip III. the cortes, or parliaments of this kingdom, have been discontinued. The higher nobility here consist of counts, marquises, and dukes. The grandees, who have precedence of all others, next the king and princes of the blood, are named out of these. They have the privilege of being covered in the king's presence, who styles them in his letters *Illustrious*; and in speaking to them or of them, their *Eminences*; but there are others beside the grandees who are covered in the king's presence; as cardinals, nuncios, archbishops, the grand prior of Castile and the grand prior of Malta, the generals of the orders of St Dominic and St Francis, ambassadors of crowned heads, the knights of the golden-fleece, and of the three military orders of St James, Calatrava, and Alcantara, when the king assists at their respective chapters in quality of grand-master. No grandee can be apprehended for any crime but by the express order of the king; and they have many other privileges besides these. The inferior nobility style themselves *Cavalleros* and *Hidalgos*.

Of the orders in Spain, that of the golden fleece is the principal; which was instituted in 1430 by Philip the Good duke of Burgundy, and is common now to the kings of Spain and the house of Austria. The order of St Jago de Compostella was instituted in the year 1175 by Ferdinand II. king of Leon. The order of Calatrava was founded by Sancho III. of Castile. The order of Alcantara owes its institution to Ferdinand II. king of Leon. The three last orders have large commanderies or estates annexed to them. The masters of them were once so powerful, that they disputed the king's authority over them; whereupon the king procured those master-ships to be conferred on himself by the Pope, that they might no longer assume an independency of the state. The knights of these three orders are esteemed noblemen.

In the last century, the revenues of Spain amounted to 32 or 33 millions of livres; but afterwards they

153
Revenues.

Span,
Spanheim.Spaniel,
Sparta.

were so reduced, that they did not exceed seven or eight millions. At present, the revenues of the crown arising in Spain are computed at five millions Sterling *per annum*, besides what arises from America. The silver mines there are inexhaustible; and of the produce of these a fifth belongs to the king. The taxes in Spain are numerous and heavy. The land-forces, in time of peace, are computed at about 80,000; and in time of war, must be much more numerous. Their navy at present cannot be ascertained.

154
Language.

The language of this country, especially that spoken in Castile, which is by far the purest, approaches the nearest to the Latin of any language in Europe, mixed with Arabic words and terminations introduced by the Moors. In some provinces, the vulgar tongue is a dialect of the old French, or rather Gascon, which is little understood in the others. In Biscay, the language is said to be a dialect of the Gothic or Celtic, and to have some analogy with the Welch and Irish. As to what regards the character of the Spaniards, they do not want either an inclination or capacity for the sciences; but have hardly an opportunity of acquiring any true learning or knowledge, at least in their schools and universities. They are admired for their secrecy, constancy, gravity, patience in adversity, and loyalty. They are also said to be true to their word, great enemies to lying, and so nice and jealous in point of honour, that they will stick at nothing to wipe off any stain that is cast upon it. Among their vices and defects are reckoned their pride and contempt of foreigners, their indolence, laziness, lust, bigotry, and credulity in believing the feigned miracles and legends of their monks. They are also said to be extremely passionate, jealous, and vindictive; and are noted, above any other European nation, for their contempt of and aversion to agriculture, arts, and manufactures.

New Spain. See MEXICO.

SPAN, a measure taken from the space between the thumb and the tip of the little finger when both are stretched out. The span is estimated at three hand's breadths or nine inches.

SPANHEIM (Ezekiel), a most learned writer in the 17th century, was born at Geneva in 1629; and in 1642 went to Leyden to study. Here he distinguished himself to great advantage; and, his reputation spreading, Charles Lewis elector palatine sent for him to be tutor to his only son. This task our author discharged to the entire satisfaction of the elector; by whom he was also employed in divers negotiations at foreign courts. He afterward entered into the service of the elector of Brandenburg, who, in 1680, sent him envoy-extraordinary to the court of France, and soon after made him a minister of state. After the peace of Ryfwic, he was again sent on an embassy to France, where he continued from the year 1697 to 1702. The elector of Brandenburg having during that interval assumed the title of *king of Prussia*, conferred on him the title and dignity of a baron. In 1702, he left France; and went ambassador to England, where he had been several times. Here he died in 1710, aged 81 years. It is surprising, that in discharging the duties of a public minister with so much exactness, and amidst so many different journeys, he could find time enough to write the several books

published by him. It may be said of him, that he acquitted himself in his negotiations like a person who had nothing else in his thoughts; and that he wrote like a man who had spent his whole time in his study. The principal of his works are, 1. *De præstantia et usu numismatum antiquorum*: the best edition of which is in two volumes folio. 2. Several letters or dissertations on scarce and curious medals. 3. A preface and notes to the edition of the Emperor Julian's works, printed at Leipzig in 1696, folio.

SPANIEL, in zoology. See CANIS.

SPAR, in natural history, a class of fossils not inflammable nor soluble in water: when pure, it is pellucid, and colourless; emulating the appearance of crystal, but wanting its distinguishing characteristics; composed of plane and equable plates; not flexible nor elastic; not giving fire with steel; readily calcining in a small fire; fermenting violently with acids, and totally soluble in them.—The spars in general are found in the fissures of stones, and about mines. Vast quantities are found in the German mines, and in those of Derbyshire in England.

SPARROW, in ornithology. See FRINGILLA.

SPARROW-HAWK, in ornithology. See FALCO.

SPARTA, or LACEDÆMON, the capital of the country of Laconia in Greece, an ancient and most renowned state, the inhabitants of which have been in all ages celebrated for their military and other virtues.—The history of Sparta for many ages is entirely fabulous; and the authentic accounts commence only with the celebrated lawgiver Lycurgus, who flourished about 870 B. C. See the article LYCURGUS.

The history of Sparta mostly fabulous till the time of Lycurgus.

After his death, the first material transaction which we find mentioned in the Spartan history is the Messenian war, which commenced in the year 752 B. C. and ended in the total reduction of the Messenian territory, as related under the article MESSENIA. During this period, according to some authors, a great change took place in the government of Sparta. This was the creation of the ephori, which is ascribed to one of the kings named *Theopompus*. This man perceiving that there was a necessity for leaving magistrates to execute the laws, when the kings were obliged to be in the field, appointed the magistrates above-mentioned, who afterwards made so great a figure in the state. See EPHORI. One great privilege of the ephori was, that they did not rise up at the preference of the kings, as all other magistrates did: another was, that if the kings offended against the laws, the ephori took cognizance of the offence, and inflicted a suitable punishment. From the first election of the ephori, the year was denominated, as at Athens, from the first of the archons.

The conquest of Messenia gave Sparta the superiority over the rest of the states, excepting only that of Athens, which for a long time continued to be a very troublesome rival; but the contests between these two rival states have been so fully related under the article ATTICA, that nothing more is requisite to be added in this place.—In the time of the Persian war, Leo- Leonidas the Spartan king distinguished himself in such a manner, as to become the admiration not only of that but of every succeeding age. It being resolved in a general council to defend the straits of Thermopylae against the Persians, 6000 foot were put under the

com.

Sparta.

command of Leonidas; of whom, however, only 300 were Spartans. Leonidas did not think it practicable to defend the pass against such multitudes as the Persian king commanded; and therefore privately told his friends, that his design was to devote himself to death for his country.

Xerxes advancing near the straits was strangely surprised to find that the Greeks were resolved to dispute his passage; for he had always flattered himself that on his approach they would betake themselves to flight, and not attempt to oppose his innumerable forces. However, Xerxes, entertaining still some hopes of their flight, waited four days without undertaking any thing, on purpose to give them time to retreat. During this time, he used his utmost endeavours to gain and corrupt Leonidas, promising to make him master of all Greece if he would come over to his interest. His offers being rejected with contempt and indignation, the king ordered him by an herald to deliver up his arms. Leonidas, in a style and with a spirit truly laconical, answered, "Come thyself, and take them." Xerxes, at this reply, transported with rage, commanded the Medes and Cissians to march against them, take them all alive, and bring them to him in fetters. The Medes, not able to stand the shock of the Greeks, soon betook themselves to flight; and in their room Hydarnes was ordered to advance with that body which was called *Immortal*, and consisted of 10,000 chosen men: but when these came to close with the Greeks, they succeeded no better than the Medes and Cissians, being obliged to retire with great slaughter. The next day the Persians, reflecting on the small number of their enemies, and supposing so many of them to be wounded that they could not possibly maintain a second fight, resolved to make another attempt; but could not by any efforts make the Greeks give way: on the contrary, they were themselves put to a shameful flight. The valour of the Greeks exerted itself on this occasion in a manner so extraordinary, that Xerxes is said to have three times leaped from his throne, apprehending the entire destruction of his army.

Xerxes having lost all hopes of forcing his way through troops that were determined to conquer or die, was extremely perplexed and doubtful what measures he should take in this posture of affairs; when one Epialtes, in expectation of a great reward, came to him, and discovered a secret passage to the top of the hill which overlooked and commanded the Spartan forces. The king immediately ordered Hydarnes thither with his select body of 10,000 Persians; who marching all night, arrived at break of day, and possessed themselves of that advantageous post. The Phocians, who defended this pass, being overpowered by the enemy's numbers, retired with precipitation to the very top of the mountain, prepared to die gallantly. But Hydarnes neglecting to pursue them, marched down the mountain with all possible expedition, in order to attack those who defended the straits in the rear. Leonidas being now apprised that it was impossible to bear up against the enemy, obliged the rest of his allies to retire: but he staid himself, with the Thebians, Thebans, and 300 Lacedæmonians, all resolved to die with their leader; who being told by the oracle, that either Sparta should be destroyed or the king lose his

Sparta.

life, determined without the least hesitation to sacrifice himself for his country. The Thebans indeed remained against their inclination, being detained by Leonidas as hostages; for they were suspected to favour the Persians. The Thebians, with their leader Demophilus, could not by any means be prevailed upon to abandon Leonidas and the Spartans. The augur Megistias, who had foretold the event of this enterprise, being pressed by Leonidas to retire, sent home his only son; but remained himself, and died by Leonidas. Those who staid did not feed themselves with any hopes of conquering or escaping, but looked upon Thermopylæ as their graves; and when Leonidas, exhorting them to take some nourishment, said, that they should all sup together with Pluto, with one accord they set up a shout of joy, as if they had been invited to a banquet.

Xerxes, after pouring out a libation at the rising of the sun, began to move with the whole body of his army, as he had been advised by Epialtes. Upon their approach, Leonidas advanced to the broadest part of the passage, and fell upon the enemy with such undaunted courage and resolution, that the Persian officers were obliged to stand behind the divisions they commanded, in order to prevent the flight of their men. Great numbers of the enemy falling into the sea, were drowned; others were trampled under foot by their own men, and a great many killed by the Greeks; who, knowing they could not avoid death upon the arrival of those who were advancing to fall upon their rear, exerted their utmost efforts. In this action fell the brave Leonidas; which Abrocomes and Hyperanthes, two of the brothers of Xerxes, observing, advanced with great resolution to seize his body, and carry it in triumph to Xerxes. But the Lacedæmonians, more eager to defend it than their own lives, repulsed the enemy four times, killed both the brothers of Xerxes, with many other commanders of distinction, and rescued the body of their beloved general out of the enemy's hands. But in the mean time, the army that was led by the treacherous Epialtes, advancing to attack their rear, they retired to the narrowest place of the passage, and drawing all together except the Thebans, posted themselves on a rising ground. In this place they made head against the Persians, who poured in upon them on all sides, till at length, not vanquished, but oppressed and overwhelmed by numbers, they all fell, except one who escaped to Sparta, where he was treated as a coward and traitor to his country; but afterwards made a glorious reparation in the battle of Platæa, where he distinguished himself in an extraordinary manner. Some time after, a magnificent monument was erected at Thermopylæ, in honour of those brave defenders of Greece, with two inscriptions; the one general, and relating to all those who died on this occasion, importing, that the Greeks of Peloponnesus, to the number only of 4000, made head against the Persian army, consisting of 3,000,000. The other related to the Spartans in particular, and was composed by the poet Simonides, to this purport: "Go, passenger, and acquaint the Spartans that we died here in obedience to their just commands." At those tombs a funeral oration was yearly pronounced in honour of the dead heroes, and public games performed with great solemnity, wherein none but the Lacedæmonians and Theb-

The Persians repulsed with great slaughter.

6
A dreadful
earthquake
in Sparta.

Thebians had any share, to show that they alone were concerned in the glorious defence of Thermopylae.

At the end of the 77th Olympiad, a most dreadful earthquake happened at Sparta, in which, according to Diodorus, 20,000 persons lost their lives; and Plutarch tells us, that only five houses were left standing in the whole city. On this occasion the Helotes or slaves, whom the Spartans had all along treated with the utmost cruelty, attempted to revenge themselves by taking up arms, and marching directly to the ruins of the city, in hopes of cutting off at once those who had escaped from the earthquake. But in this they were prevented by the prudence of the Spartan king Archidamus; for he, observing that the citizens were more desirous of preserving their effects than taking care of their own lives, caused an alarm to be sounded, as if he had known that an enemy was at hand. On this the citizens armed themselves in haste with such weapons as they could come at; and having marched a little way from the city, met the Helotes, whom they soon compelled to retire. The latter, however, knowing that they had now no mercy to expect from those who had already treated them with such cruelty, resolved to defend themselves to the last. Having therefore seized a sea-port town in Messenia, they from thence made such incursions into the Spartan territories, that they compelled those imperious masters to ask assistance from the Athenians. This was immediately granted; but when the Spartans saw that the skill of the Athenians in besieging towns was much greater than their own, they became jealous, and dismissed their allies, telling them, that they had now no farther occasion for their services. On this the Athenians left them in disgust; and as the Helotes and Messenians did not choose to come to an engagement with a Spartan army in the field, but took shelter in their fortified places, the war was protracted to ten years and upwards. At last the Helotes were reduced to their former misery; and the Messenians were obliged to leave Peloponnesus, on pain of being made slaves also. These poor people were then received by the Athenians, who granted them Naupactus for their residence, and afterwards brought them back to a part of their own country, from whence in the course of the Peloponnesian war they had driven the Spartans.

8
With the
Athenians
and Per-
sians.

In the year 431 B. C. the Peloponnesian war commenced; of which a full account has been given under the article *ATTICA*, n° 108—165. It ended most unfortunately for the Athenians; their city being taken and dismantled, as related in the article above mentioned. Thus were the Spartans raised to the highest pitch of glory; and, in the reign of Agésilas, they seemed to be on the point of subverting the Persian empire, as related under the article *PERSIA*, n° 30. But here their good fortune and their views of empire were suddenly checked. Agésilas had carried on the war in Asia with the greatest success; and as he would hearken to no terms of accommodation, a Persian governor named *Tithraustes*, having first attempted in vain to bribe the king, dispatched Timocrates the Rhodian with 50 talents into Greece, in order to try whether he could there meet with any persons less incorruptible than the Spartan monarch. This agent found many who inclined to accept his offers; particularly in Thebes, Corinth, and Argos. By distribu-

ting the money in a proper manner, he inflamed the inhabitants of these three cities against the Spartans; and of all others the Thebans came into his terms with the greatest readiness. They saw that their antagonists would not of their own accord break with any of the states of Greece, and did not choose to begin the war themselves, because the chiefs of the Persian faction were unwilling to be accountable for the event. For this reason they persuaded the Locrians to invade a small district which lay in dispute betwixt the Phocians and themselves. On this the Phocians invaded Locris; the Locrians applied to the Thebans, and the Phocians to the Spartans. The latter were glad of an opportunity of breaking with the Thebans; but met with a much warmer reception than they expected. Their old general Lyfander, who had reduced Athens, was defeated and killed, with the loss of 1000 men: on which disaster Agésilas was recalled, and obliged to relinquish all hopes of conquering the Persians. His return changed the fortune of the war so much, that all the states began to grow weary of a contest from which nobody derived any advantage except the king of Persia. In a short time a treaty was concluded, known in history by the name of the *peace of Antaleidas*. The terms of this treaty were highly disadvantageous and dishonourable to the Greeks; for even the Spartans, though successful in Greece, had lost a great battle at sea with the Persian fleet under Conon the Athenian, which entirely broke their power in Asia.

By the peace of Antaleidas, the government of Bœotia was taken from the Thebans, which they had for a long time enjoyed; and by this they were so much provoked, that at first they absolutely refused to accede to the treaty; but as Agésilas made great preparations to invade them, they thought proper at last to comply. However, it was not long before a new war commenced, which threatened the total subversion of the Spartan state. As, by the peace of Antaleidas, the king of Persia had in a manner guaranteed the sovereignty of Greece to Sparta, this republic very soon began to exercise its power to the utmost extent. The Mantineans were the first who felt the weight of their resentment, although they had been their allies and confederates. In order to have a pretence for making war against them, they commanded them to quit their city, and to retire into five old villages which, they said, had served their forefathers, and where they would live in peace themselves, and give no umbrage to their neighbours. This being refused, an army was sent against them to besiege their city. The siege was continued through the summer with very little success on the part of the Spartans; but having during the winter season dammed up the river on which the city stood, the water rose to such an height, as either to overflow or throw down the houses; which compelled the Mantineans to submit to the terms prescribed to them, and to retire into the old villages. The Spartan vengeance fell next on the Philiatians and Olynthians, whom they forced to come into such measures as they thought proper. After this they fell on the Thebans; and, by attempting to seize on the Piræum, drew the Athenians also into the quarrel. But here their career was stopped: the Thebans had been taught the art of war by Chabrias the Athenian; so that even

Sparta.

12
The power
of Sparta
entirely
broken.

Ageläus himself took the command of the Spartan army in vain. At sea they were defeated by Timotheus the son of Conon; and by land the battle of Leuctra put an end to the superiority which Sparta had held over Greece for near 500 years. See LEUCTRA.

After this dreadful defeat, the Spartans had occasion to exert all their courage and resolution. The women, and nearest relations of those who were killed in battle, instead of spending their time in lamentations, shook each other by the hand, while the relations of those who had escaped from the battle hid themselves among the women; or if they were obliged to go abroad, they appeared in tattered cloaths, with their arms folded, and their eyes fixed on the ground. It was a law among the Spartans, that such as fled from battle should be degraded from their honours, should be constrained to appear in garments patched with divers colours, to wear their beards half-shaved, and to suffer any to beat them who pleased, without resistance. At present, however, this law was dispensed with; and Ageläus by his prudent conduct kept up the spirits of the people, at the same time that by his skill in military affairs he checked the progress of the enemy. Yet, during the lifetime of Epaminondas the Theban general, the war went on greatly to the disadvantage of the Spartans; but he being killed at the battle of Mantinea, all parties became quickly desirous of peace. Ageläus did not long survive; and with him, we may say, perished the glory of Sparta. Soon after this all the states of Greece fell under the power of Alexander the Great; and the Spartans, as well as the rest, having become corrupt, and lost their martial spirit, became a prey to domestic tyrants, and to foreign invaders. They maintained their ground, however, with great resolution against the celebrated Pyrrhus king of Epirus; whom they repulsed for three days successively, though not without assistance from one of the captains of Antigonus. Soon after this one of the kings of Sparta named Agis, perceiving the universal degeneracy that had taken place, made an attempt to restore the laws and discipline of Lycurgus, by which he supposed the state would be restored to its former glory. But though at first he met with some appearance of success, he was in a short time tried and condemned by the ephori as a traitor to his country.—Cleomenes, however, who ascended the throne in 216 B. C. accomplished the reformation which Agis had attempted in vain. He suppressed the ephori; cancelled all debts; divided the lands equally, as they had been in the time of Lycurgus; and put an end to the luxury which prevailed among the citizens. But at last he was overborne by the number of enemies which surrounded him; and being defeated in battle by Antigonus, he fled to Egypt, where he put an end to his own life. With him perished every hope of retrieving the affairs of Sparta: the city for the present fell into the hands of Antigonus; after which a succession of tyrants took place; till at last all disturbances were ended by the Romans, who reduced MACEDON and GREECE to provinces of their empire, as has been related under these articles.

14
Institutions
of Lycurgus.

It remains now only to say something concerning the character, manners, and customs of the Spartans, which, as they were founded on the laws of Lycurgus, may best be learned from a view of these laws.

The institutions of Lycurgus were divided into 12 twelve tables.—The first comprehended such of the Spartan laws as regarded religion. The statues of all the gods and goddesses were represented in armour, even to Venus herself; the reason of which was, that the people might conceive a military life the most noble and honourable, and not attribute, as other nations did, sloth and luxury to the gods. As to sacrifices, they consisted of things of very small value; for which Lycurgus himself gave this reason, That want might never hinder them from worshipping the gods. They were forbidden to make long or rash prayers to the heavenly powers, and were enjoined to ask no more than that they might live honestly and discharge their duty. Graves were permitted to be made within the bounds of the city, contrary to the custom of most of the Greek nations; nay, they buried close by their temples, that all degrees of people might be made familiar with death, and not conceive it such a dreadful thing as it was generally esteemed elsewhere: on the same account the touching of dead bodies, or assisting at funerals, made none unclean, but were held to be as innocent and honourable duties as any other. There was nothing thrown into the grave with the dead body; magnificent sepulchres were forbidden; neither was there so much as an inscription, however plain or modest, permitted. Tears, sighs, outcries, were not allowed in public, because they were thought dishonourable in Spartans, whom their lawgiver would have to bear all things with equanimity. Mournings were limited to 11 days; on the 12th the mourner sacrificed to Ceres, and threw aside his or her weeds. In favour of such as were slain in the wars, however, and of women who devoted themselves to a religious life, there was an exception allowed as to the rules before-mentioned; for such had a short and decent inscription on their tombs. When a number of Spartans fell in battle, at a distance from their country, many of them were buried together under one common tomb; but if they fell on the frontiers of their own state, then their bodies were carefully carried back to Sparta, and interred in their family-sepulchres.

Sparta.

15
His laws
concerning
religion.

II. Lycurgus divided all the country of Laconia into 30,000 equal shares: the city of Sparta he divided into 9,000, as some say; into 6000, as others say; and, as a third party will have it, into 4500. The intent of the legislator was, that property should be equally divided amongst his citizens, so that none might be powerful enough to oppress his fellows, or any be in such necessity, as to be therefrom in danger of corruption. With the same view he forbade the buying or selling these possessions. If a stranger acquired a right to any of these shares, he might quietly enjoy it, provided he submitted to the laws of the republic. The city of Sparta was unwall'd; Lycurgus trusting it rather to the virtue of its citizens than to the art of masons. As to the houses, they were very plain; for their ceilings could only be wrought by the ax, and their gates and doors only by the saw; and their utensils were to be of a like stamp, that luxury might have no instruments among them.

III. The citizens were to be neither more nor less than the number of city-lots; and if at any time there happened to be more, they were to be led out in colonies. As to children, their laws were equally harsh and

16

Concerning
the division
of land.

17

the children,
and, &c.

Sparta.

and unreasonable; for a father was directed to carry his new-born infant to a certain place, where the gravest men of his tribe looked upon the infant; and if they perceived its limbs straight, and thought it had a wholesome look, then they returned it to its parents to be educated; otherwise it was thrown into a deep cavern at the foot of the mountain Taygetus. This law seems to have had one very good effect, viz. making women very careful, when they were with child, of either eating, drinking, or exercising, to excess: it made them also excellent nurses; for which they were in mighty request throughout Greece. Strangers were not allowed to reside long in the city, that they might not corrupt the Spartans by teaching them new customs. Citizens were also forbid to travel for the same reason, unless the good of the state required it. Such as were not bred up in their youth according to the law, were not allowed the liberty of the city, because they held it unreasonable, that one who had not submitted to the laws in his youth should receive the benefit of them when a man. They never preferred any stranger to a public office; but if at any time they had occasion for a person not born a Spartan, they first made him a citizen, and then preferred him.

18
Of celibacy
and marriage.

IV. Celibacy in men was infamous, and punished in a most extraordinary manner; for the old bachelor was constrained to walk naked, in the depth of winter, through the market-place: while he did this, he was obliged to sing a song in disparagement of himself; and he had none of the honours paid him which otherwise belonged to old age, it being held unreasonable, that the youth should venerate him who was resolved to leave none of his progeny behind him, to reverse them when they grew old in their turns. The time of marriage was also fixed; and if a man did not marry when he was of full age, he was liable to an action; as were such also as married above or below themselves. Such as had three children had great immunities; such as had four were free from all taxes whatsoever. Virgins were married without portions; because neither want should hinder a man, nor riches induce him, to marry contrary to his inclinations. When a marriage was agreed on, the husband committed a kind of rape upon his bride. Husbands went, for a long time, secretly and by stealth, to the beds of their wives, that their love might not be quickly and easily extinguished. Husbands were allowed to lend their wives; but the kings, however, were forbid to take this liberty. Some other laws of the like nature there were, which as they were evidently against modesty, so they were far from producing the ends for which Lycurgus designed them; since, though the men of Sparta were generally remarkable for their virtue, the Spartan women were as generally decried for their boldness and contempt of decency.

19
Education
of their
children.

V. It was the care of Lycurgus, that, from their very nonage and infancy, the Lacedæmonians should be inured to conquer their appetites: for this reason he directed, that nurses should accustom their children to spare meals, and now-and-then to fasting; that they should carry them, when 12 or 13 years old, to those who should examine their education, and who should carefully observe whether they were able to be in the dark alone, and whether they had got over all

Sparta.

other follies and weaknesses incident to children. He directed, that children of all ranks should be brought up in the same way; and that none should be more favoured in food than another, that they might not, even in their infancy, perceive any difference between poverty and riches, but consider each other as equals, and even as brethren, to whom the same portions were assigned, and who, through the course of their lives, were to fare alike: Only youths were allowed to eat flesh; older men eat their black broth and pulse; the lads slept together in chambers, and after a manner somewhat resembling that still in use in Turkey for the Janizaries: their beds, in the summer, were very hard, being composed of the reeds plucked by the hand from the banks of the Eurotas: in winter their beds were softer, but by no means downy, or fit to indulge immoderate sleep. They eat altogether in public; and in case any abstained from coming to the tables, they were fined. It was likewise strictly forbidden for any to eat or drink at home before they came to the common meal; even then each had his proper portion, that every thing might be done there with gravity and decency. The black broth was the great rarity of the Spartans, which was composed of salt, vinegar, blood, &c.; so that, in our times, it would be esteemed a very unfavourable soup. If they were moderate in their eating, they were so in their drinking also; thirst was the sole measure thereof; and never any Lacedæmonian thought of drinking for pleasure: as for drunkenness, it was both infamous and severely punished; and, that young men might perceive the reason, slaves were compelled to drink to excess, that the baseness of the vice might appear. When they retired from the public meal, they were not allowed any torches or lights, because it was expected, that men who were perfectly sober should be able to find their way in the dark; and, besides, it gave them a facility of marching without light; a thing wonderfully useful to them in time of war.

19
Of their
diet, clothing, &c.

VI. As the poor eat as well as the rich, so the rich could wear nothing better than the poor: they neither changed their fashion nor the materials of their garments; they were made for warmth and strength, not for gallantry and show: and to this custom even their kings conformed, who wore nothing gaudy in right of their dignity, but were contented that their virtue should distinguish them rather than robes. The young lads wore a tunic till they were twelve years old; afterwards they had a cloak given them, which was to serve them a year: and their clothing was, in general, so thin, that a Lacedæmonian vest became proverbial. Boys were always used to go without shoes; but when they grew up, they were indulged to them, if the manner of life they led required it; but they were always inured to run without them, as also to climb up and slip down steep places with bare feet: nay, the very shoe they used was of a particular form, plain and strong, and from the place of its invention, Laconic. Boys were not permitted to wear their hair; but when they grew up, they did not cut it. Baths and anointing were not much in use among the Lacedæmonians; the river Eurotas supplied the former, and exercise the latter. In the field, however, their sumptuary laws did not take place so strictly as in the city; for when they went to war, they wore purple habits;

Sparta.

habits; they put on crowns when they were about to engage the enemy; they had also rings, but they were of iron; which metal was most esteemed by this nation. Young women wore their vests or jerkins only to their knees, or, as some think, not quite so low; a custom which both Greek and Roman authors censure as indecent. Gold, precious stones, and other costly ornaments, were permitted only to common women; which permission was the strongest prohibition to women of virtue, or who affected to be thought virtuous. Virgins went abroad without veils, with which married women, on the contrary, were always covered. In certain public exercises, in which girls were admitted as well as boys, they were both obliged to perform naked. Plutarch apologizes for this custom, urging, that there could be no danger from nakedness to the morals of youth whose minds were fortified by and habituated to virtue. One of Lycurgus's principal views in his institutions, was to eradicate the very seeds of civil dissensions in his republic. Hence proceeded the equal divisions of estates enjoined by him; hence the contempt of wealth, and the neglect of other distinctions, as particularly birth, he considering the people of his whole state as one great family; distinctions which, in other commonwealths, frequently produce tumults and confusions that shake their very foundation.

20
Obedience
to their su-
periors.

VII. Though the Spartans were always free, yet it was with this restriction, that they were subservient to their own laws, which bound them as strictly in the city as soldiers, in other states, were bound by the rules of war in the camp. In the first place, strict obedience to their superiors was the great thing required in Sparta. This they looked upon as the very basis of government; without which neither laws nor magistrates availed much. Old age was an indubitable title to honour in Sparta; to the old men the youth rose up whenever they came into any public place; they gave way to them when they met them in the streets, and were silent whenever their elders spoke. As all children were looked upon as the children of the state, so all the old men had the authority of parents: they reprehended whatever they saw amiss, not only in their own, but in other peoples children; and by this method Lycurgus provided, that as youth are every where apt to offend, they might be nowhere without a monitor. The laws went still further: if an old man was present where a young one committed a fault, and did not reprove him, he was punished equally with the delinquent. Amongst the youths there was one of their own body, or at most two years older than the rest, who was styled *iren*: he had authority to question all their actions, to look strictly to their behaviour, and to punish them if they did amiss; neither were their punishments light, but, on the contrary, very severe; whereby the youth were made hardy, and accustomed to bear stripes and rough usage. Silence was a thing highly commended at Sparta, where modesty was held to be a most becoming virtue in young people; nor was it restrained only to their words and actions, but to their very looks and gestures; Lycurgus having particularly directed, that they should look forward, or on the ground, and that they should always keep their hands within their robes. A stupid inconsiderate person, one who would

Vol. X.

Sparta.

not listen to instruction, but was careless of whatever the world might say of him, the Lacedæmonians treated as a scandal to human nature; with such an one they would not converse, but threw him off as a rotten branch and worthless member of society.

21

Learning.

VIII. The plainness of their manners, and their being so very much addicted to war, made the Lacedæmonians less fond of the sciences than the rest of the Greeks. A soldier was the only reputable profession in Sparta; a mechanic or husbandman was thought a low fellow. The reason of this was, that they imagined professions which required much labour, some constant posture, being continually in the house, or always about a fire, weakened the body and depressed the mind; whereas a man brought up hardily, was equally fit to attend the service of the republic in time of peace, and to fight its battles when engaged in war. Such occupations as were necessary to be followed for the benefit of the whole, as husbandry, agriculture, and the like, were left to their slaves the Helotes; but for curious arts, and such as served only to luxury, they would not so much as suffer them to be introduced in their city; in consequence of which, rhetoricians, augurs, bankers, and dealers in money, were shut out. The Spartans admitted not any of the theatrical diversions among them; they would not bear the representation of evil even to produce good; but other kinds of poetry were admitted, provided the magistrates had the perusal of pieces before they were handed to the public.

Above all things, they affected brevity of speech, and accustomed their children, from their very infancy, never to express themselves in more words than were strictly necessary; whence a concise and sententious oratory is to this day styled *Laconic*. In writing they used the same conciseness; of which we have a signal instance in a letter of Archidamus to the Eleans, when he understood that they had some thoughts of assisting the Arcadians. It ran thus: "Archidamus to the Eleans: It is good to be quiet." And therefore Epaminondas thought that he had reason to glory in having forced the Spartans to abandon their monosyllables and to lengthen their discourses.

The greatest part of their education consisted in giving their youth right ideas of men and things: the iren or master proposed questions, and either commended the answers that were made him, or reproofed such as answered weakly. In these questions, all matters, either of a trivial or abstruse nature, were equally avoided; and they were confined to such points as were of the highest importance in civil life; such as, Who was the best man in the city? Wherein lay the merit of such an action? and, Whether this or that hero's fame was well founded? Harmless raillery was greatly encouraged; and this, joined to their short manner of speaking, rendered laconic replies universally admired.

Music was much encouraged; but in this, as in other things, they adhered to that which had been in favour with their ancestors; nay, they were so strict therein, that they would not permit their slaves to learn either the tune or the words of their most admired odes; or, which is all one, they would not permit them to sing them if they had learned them. The youth of the male sex were much cherished and be-

41 G

loved.

Sparta.

loved, as those that were to build up and continue the future glory of the state, yet in Sparta it was a virtuous and modest affection, untinged with that sensuality which was so scandalous at Athens. The good effects of this part of Lycurgus's institutions were seen in the union that reigned among his citizens; and which was so extraordinary, that even in cases of competition, it was hardly known that rivals bore ill-will to each other; but, on the contrary, their love to the same person begat a secondary friendship among themselves, and united them in all things which might be for the benefit of the person beloved.

Some authors have accused this great lawgiver of encouraging theft in his institutions; which, they say, was not held scandalous among the Spartans, if it were so dexterously managed as that the person was not detected in it. But this is certain, and seems to be a strong contradiction of the heinous charge, that when a theft was discovered, it was punished with the utmost severity: a person even suspected of it would endure the heaviest punishments rather than acknowledge it, and be branded with so base a crime.

22
Exercises.

IX. The exercises instituted by law fall under the ninth table. In these all the Greeks were extremely careful; but the Lacedæmonians in a degree beyond the rest: for if a youth, by his corpulence, or any other means, became unfit for these exercises, he underwent public contempt at least, if not banishment. Hunting was the usual diversion of their children; nay, it was made a part of their education, because it had a tendency to strengthen their limbs, and to render those who practised it supple and fleet: they likewise bred up dogs for hunting with great care. They had a kind of public dances, in which they exceedingly delighted, and which were common alike to virgins and young men: indeed, in all their sports, girls were allowed to divert themselves with the youths; in so much that, at darting, throwing the quoit, pitching the bar, and such-like robust diversions, the women were as dexterous as the men. For the manifest oddity of this proceeding, Lycurgus assigned no other reason, than that he sought to render women, as well as men, strong and healthy, that the children they brought forth might be so too. Violent exercises, and a laborious kind of life, were only enjoined the youth; for when they were grown up to mens estate, that is, were upwards of 30 years old, they were exempted from all kinds of labour, and employed themselves wholly either in affairs of state or in war. They had a method of whipping, at a certain time, young lads in the temple of Diana, and about her altar; which, however palliated, was certainly unnatural and cruel. It was esteemed a great honour for lads to sustain these flagellations without weeping, groaning, or showing any sense of pain; and the thirst of glory was so strong in these young minds, that they very frequently suffered death without shedding a tear or breathing a sigh. A desire of overcoming all the weaknesses of human nature, and thereby rendering his Spartans not only superior to their neighbours, but to their species, runs through many of the institutions of Lycurgus; which principle, if well attended to, thoroughly explains them, and without attending to which it is impossible to give any account of them at all.

23
Money, &c.

X. Gold and silver were, by the constitutions of

Sparta.

Lycurgus, made of no value in Sparta. He was so well apprised of the danger of riches, that he made the very possession of them venal; but as there was no living without some sort of money, that is, some common measure or standard of the worth of things, he directed an iron coinage, whereby the Spartans were supplied with the useful money, and at the same time had no temptation to covetousness afforded them; for a very small sum was sufficient to load a couple of horses, and a great one must have been kept in a barn or warehouse. The coming in of all foreign money was also prohibited, that corruption might not enter under the name of commerce. The most ancient method of dealing, viz. by barter, or exchange of one commodity for another, was preferred by law in Sparta long after it had been out of date every where else. Interest was a thing forbid in the Spartan commonwealth; where they had also a law against alienation of lands, accepting presents from foreigners, even without the limits of their own country, and when their authority and character might well seem to excuse them.

24

XI. Such of the laws of Sparta as related to courts of justice may be brought under the 11th table. Thirty years must have passed over the head of him who had a right to concern himself in juridical proceedings. Young men were thought unfit for them; and it was even held indecent, and of ill report, for a man to have any fondness for law-suits, or to be busying himself at the tribunals, when he had no affairs there of his own. By these rules Lycurgus thought to shut out litigiousness, and to prevent that multiplicity of suits which is always scandalous in a state. As young people were not permitted to inquire about the laws of other countries, and as they were hindered from hearing judicial proceedings in their courts, so they were likewise forbidden to ask any questions about, or to endeavour to discover, the reasons of the laws by which themselves were governed. Obedience was their duty; and to that alone they would have them kept. Men of abandoned characters, or who were notoriously of ill fame, lost all right of giving their votes in respect of public affairs, or of speaking in public assemblies; for they would not believe that an ill man in private life could mean his country better than he did his neighbour.

25

XII. Till a man was 30 years old, he was not capable of serving in the army, as the best authors agree; though some think that the military age is not well ascertained by ancient writers. They were forbidden to march at any time before the full-moon; the reason of which law is very hard to be discovered, if indeed it had any reason at all, or was not rather founded on some superstitious opinion, that this was a more lucky conjuncture than any other. They were likewise forbidden to fight often against the same enemy; which was one of the wisest maxims in the political system of Lycurgus: and Agesilaus, by offending against it, destroyed the power of his country, and lost her that authority which for many ages he maintained over the rest of Greece; for, by continually warring against the Thebans, to whom he had an inveterate hatred, he at last beat them into the knowledge of the art of war, and enabled them, under the command of Epaminondas, to maintain for a time the prin-

Sparta.

principality of Greece. Maritime affairs they were forbidden to meddle with; though the necessity of things compelled them, in process of time, to transgress this institution, and by degrees to transfer to themselves as well the dominion at sea as land: but, after the Peloponnesian war they again neglected naval affairs, from a persuasion that sailors and strangers corrupted those with whom they conversed. As they never fortified Sparta, they were not ready to undertake sieges: fighting in the field was their proper province, and, while they could overcome their enemies there, they rightly conceived, that nothing could hurt them at home. In time of war, they relaxed somewhat of their strict manner of living, in which they were singular. The true reason for this was, in all probability, that war might be less burdensome to them; for, as we have more than once observed, a strong desire to render them bold and warlike was the reigning passion of their legislator. They were forbidden to remain long encamped in the same place, as well to hinder their being surprised, as that they might be more troublesome to their enemies, by wasting every corner of their country. They slept all night in their armour; but their outguards were not allowed their shields, that, being unprovided of defence, they might not dare to sleep. In all expeditions they were careful in the performance of religious rites; and, after their evening-meal was over, the soldiers sung together hymns to their gods. When they were about to engage, the king sacrificed to the muses, that, by their assistance, they might be enabled to perform deeds worthy of being recorded to latest times. Then the army advanced in order to the sound of flutes, which played the hymn of Castor. The king himself sung the psalm, which was the signal to charge. This was done with all the solemnity imaginable; and the soldiers were sure either to die or conquer: indeed they had no other choice; for if they fled they were infamous, and in danger of being slain, even by their own mothers, for disgracing their families. In this consisted all the excellency of the Spartan women, who, if possible, exceeded in bravery the men, never lamenting over husbands or sons, if they died honourably in the field; but deploring the shame brought on their house, if either the one or the other escaped by flight. The throwing away a shield also induced infamy; and, with respect to this, mothers, when they embraced their departing sons, were wont to caution them, that they should either return armed as they were, or be brought back so when they were dead; for, as we have observed, such as were slain in battle were nevertheless buried in their own country. When they made their enemies fly, they pursued no longer than till victory was certain; because they would seem to fight rather for the honour of conquering, than of putting their enemies to death. According to their ancient rules of war, they were bound not to spoil the dead bodies of their enemies; but in process of time, this, and indeed many other of their most excellent regulations, fell into desuetude. He who overcame by stratagem, offered up an ox to Mars; whereas he who conquered by force, offered up only a cock; the former being esteemed more manly than the latter. After 40 years service, a man was, by law, no longer required to go into the field; and consequently if the

military age was 30, the Spartans were not held in-
valids till they were 70.

SPARTIANUS (Ælius), a Latin historian, who wrote the lives of Adrian, Caracalla, and four other Roman emperors. He lived under the reign of Dioclesian, about the year 290.

SPARTIUM, broom; a genus of the decandria order, belonging to the diadelphia class of plants. There are 10 species, all of them of shrubby growth. Of these one is the common broom, which grows naturally in this country; the rest are exotics, chiefly from Spain, Portugal, Italy, and other southern parts of Europe, and the Levant. Three of these, viz. the scoparium, or common broom; the junceum, or yellow Spanish broom; and the radiatum, or starry Italian broom, are hardy; but all the rest require the shelter of a green-house in severe winters.—They are all propagated by seeds.—The young flowers of the common broom are sometimes preserved as pickles; and the plant when burnt affords a tolerably pure alkaline salt. Dr Mead relates, that a dropical patient, who had taken the usual remedies, and been tapped three times without effect, was cured by taking half a pint of the decoction of green broom tops, with a spoonful of whole mustard-seed every morning and evening. “An infusion of the seeds drank freely (says Mr Withering) has been known to produce similar happy effects; but whoever expects these effects to follow in every dropical case, will be greatly deceived. I knew them succeed in one case that was truly deplorable; but out of a great number of cases in which the medicine had a fair trial, this proved a single instance. The branches or stalks of common broom being dried in the sun, and treated like hemp, produce threads which may be spun, and worked into a coarse linen-cloth. The wood of a West Indian species of broom, called by Millar the *spartium arborescens*, and frequently known by the name of *American ebony*, is of a fine greenish brown colour, hard, durable, and takes an exceeding fine polish.

SPARUS, the GILTHEAD; a genus of fishes belonging to the order of thoracici. The fore-teeth and dog-teeth are very strong; the grinders are obtuse and thick set; the lips are folded over; there are five rays in the gill membrane; and the opercula are scaly; the body is compressed; the lateral line is crooked behind; and the pectoral fins are roundish.

There are 26 species, three of which are natives of the British seas. The lunulated gilthead grows to the weight of ten pounds, and takes its name from the predominant colour; that of the fore-head and sides being as if gilt; but the latter are tinged with brown. It is one of the *pisces saxatiles*, or fish that haunts deep waters on bold rocky shores. They feed chiefly on shell-fish, which they comminute with their teeth before they swallow; the teeth of this genus in particular being adapted for that purpose: the grinders are flat and strong, like those of certain quadrupeds; besides which, there are certain bones in the lower part of the mouth that assist in grinding their food. They are but a coarse fish: they were known to the Romans, who did not esteem them unless they were fed with Lucrine oysters, as Martial informs us.

Non omnis laudem præstingit AURATA mercuri

Sed cui solus erit concha Lærina cibis. Lib. xiii. Ep. 90.

In the account of captain Cook's voyage published

Spartianus

Spartianus

Spasim
||
Specifics.

by Mr Forster, we are informed, that the gilthead is sometimes poisonous, owing to their feeding on certain species of the raja, which have an extremely acrid and stimulating property.

SPASM, a convulsion. See MEDICINE, n° 135, 191.

SPATHA, in botany, a sheath; a species of calix which bursts lengthwise, and protrudes a stalk supporting one or more flowers, which commonly have no perianthium or flower-cup.

SPATHACEÆ, (from *spatha*, a "sheath"), the name of the ninth order in Linnæus's Fragments of a Natural Method, consisting of plants whose flowers are protruded from a spathe or sheath. See BOTANY, p. 1306.

SPAWN, in natural history, the eggs of fishes or frogs. See FISH, and RANA.

SPAVIN, in the manege, a disease in horses, being a swelling or stiffness, usually in the ham, occasioning a lameness. See FARRIER, § xxvii. and xxxii. 2, 3.

SPAYING, or SPADING, the operation of castrating the females of several kinds of animals, as sows, bitches, &c. to prevent any further conception, and promote their fattening. It is performed by cutting them in the mid flank, on the left side, with a sharp knife or lancet, taking out the uterus and cutting it off, and so stitching up the wound, anointing the part with tar, and keeping the animal warm for two or three days. The usual way is to make the incision oblique, two inches and a half long; that the fore-finger may be put in towards the back, to feel for the ovaries, which are two kernels as big as acorns on both sides of the uterus, one of which is drawn to the wound, and thus both taken out.

SPEAKER of the House of Commons, a member of the house elected by a majority of votes thereof to act as chairman or president in putting questions, reading briefs, or bills, keeping order, reprimanding the refractory, adjourning the house, &c. See PARLIAMENT.

SPEAKING, the art or act of expressing one's thoughts in articulate sounds or words. See GRAMMAR, LANGUAGE, READING, n° vi. vii. and ORATORY, part iv.

SPEAKING-Trumpet. See ACOUSTICS, n° 26.

SPECIAL, something that is particular, or has a particular designation; from the Latin *species*, in opposition to the *general*, from *genus*.

SPECIES, in logic, a relative term expressing an idea which is comprised under some general one called a *genus*. See LOGIC, n° 18. &c.

SPECIES, in commerce, are the several pieces of gold, silver, copper, &c. which having passed their full preparation and coinage, are current in public. See MONEY.

SPECIFIC, in philosophy, that which is peculiar to any thing, and distinguishes it from all others.

SPECIFICS, in medicine. By specifics is not meant such as infallibly and in all patients produce salutary effects. Such medicines are not to be expected, because the operations and effects of remedies are not formally inherent in them, but depend upon the mutual action and reaction of the body and medicine upon each other; hence the various effects of the same medicine in the same kind of disorders in different patients, and in the same patient at different times.

By specific medicines we understand such medicines as are more infallible than any other in any particular disorder.

Spectacles
||
Speedwell

SPECTACLES, in dioptrics, a machine consisting of two lenses set in silver, horn, &c. to assist the defects of the organ of sight. Old people, and others who have flat eyes, use convex spectacles, which cause the rays of light converge so as to fall upon the retina; whereas myopes, or short-sighted people, use concave lenses for spectacles, which causes the rays to diverge, and prevent their meeting ere they reach the retina. See OPTICS, n° 66.

SPECULARIS LAPIS, in natural history, a genus of talcs, composed of large plates visibly separate, and of extreme thinness; and each fissile again separated into a number of plates still finer. See TALC. Of this genus there are three species: 1. The white shining species, with large and broad leaves, commonly called *Isinglass* and *Muscovy-glass*: its lamellæ, or leaves, are extremely thin, elastic, and transparent; it makes not the least effervescence with aqua-fortis, and is not easily calcined in the fire. It is imported in great quantities; the miniature-painters cover their pictures with it; the lantern-makers sometimes use it instead of horn; and minute objects are usually preserved between two plates of it, for examination by the microscope. 2. The bright brown specularis, with broad leaves; a very valuable species, though inferior to the former. 3. The purple bright specularis, with broad leaves; which is the most elegant of all the talcs, and not less beautifully transparent than the first kind.

SPECULATIVE, something relating to the theory of some art or science, in contradistinction to practical.

SPECULUM, a LOOKING-GLASS, or *Mirror*, capable of reflecting the rays of the sun, &c. See OPTICS, n° 160, 161. p. 5575. 5576.

SPECULUM, in surgery, an instrument for dilating a wound, or the like, in order to examine it attentively. See SURGERY.

SPECULUMS, for reflecting telescopes. See OPTICS, p. 5603, 5610.

SPEECH, in general, the art or act of expressing a person's thoughts by means of articulate sounds, which we call words. See LANGUAGE, GRAMMAR, READING, n° vi. vii. and ORATORY, part iv.

SPEED (John), an eminent English historian, was born at Farington, in Cheshire, in 1552. He was by profession a taylor, and free of the company of merchant-tailors in the city of London. In 1606, he published his Theatre of Great Britain, which was afterwards reprinted in folio, under the title of the Theatre of the Empire of Great Brittain. His Genealogies of Scripture were first bound up with the Bible in 1611, which was the first edition of the present translation. In 1614, appeared his History of Great Brittain, which has been translated into Latin; and in 1616 he published his Cloud of Witnesses, in octavo. He lived in marriage 57 years with his wife, by whom he had twelve sons and six daughters; and died in 1629. He was interred in the church of St Giles's, Cripplegate, London, where a monument was erected to his memory.

SPEEDWELL, in botany. See VERONICA.

SPELL,

Spell
Spelman.

Spelter,
Spenser.

SPELL, in general, denotes the same with **CHARM** or **ANULET**.

SPELLING, in grammar, that part of orthography which teaches the true manner of resolving words into their syllables.

All words are either simple or compound, as *use*, *disuse*; *done*, *undone*; and the rules for dividing each, must be such as are derived from the analogy of language in general, or from the established custom of speaking; which, for the English language, are reduced to the following rules: 1. A consonant between two vowels must be joined with the latter in spelling, as *na-ture*, *ve-ri-ty*, *ge-ne-rous*: except, however, the letter *x*, which is joined to the first, as in *flux-en*, *ox-en*, &c. and compound words, as in *up-on*, *un-used*, &c. 2. A double consonant must be divided, as in *let-ter*, *man-ner*, &c. 3. Those consonants which can begin a word, must not be parted in spelling, as in *de-fraud*, *re-prove*, *di-strict*: however, this rule is found sometimes to fail; for though *gn* begins a word, as *gnaw* *gnat*, &c. yet it must be divided in spelling, as in *cog-ni-zance*, *ma-lig-ni-ty*, &c. 4. Those consonants which cannot begin a word must be divided, as *ld* in *fel-dom*, *lt* in *mul-ti-tude*, *mp* in *tem-per*, *rd* in *ar-dent*; but in final syllables there are exceptions, as *tl* in *ti-tle*, *dl* in *han-dle*, &c. 5. When two vowels come together, and are both of them distinctly founded, they must be separated in spelling, as in *co-e-val*, *mu-tu-al*, &c. 6. The grammatical terminations or endings, must be separated in spelling, as in *ed* in *wing-ed*, *edst* in *de-li-ver-edst*, *ing* in *hear-ing*, *ance* in *de-li-ver-ance*, &c. 7. Compound words must be resolved into their simple or component words, as *up-on*, *in-to*, *never-the-less*, *not-with-stand-ing*, &c.

SPELMAN, (Sir Henry) an eminent English antiquarian, was descended from an ancient family, and born at Cengham, near Lynn in Norfolk, about the year 1561. He was knighted by king James I. who had a particular esteem for him on account of his known capacity for business; and he employed him several times in Ireland on public affairs. When he was about 50 years of age, he went to reside in London; where falling into a study to which his own genius had always inclined him, he collected all such books and Mss. as concerned the subject of antiquities, either foreign or domestic. In 1626, he published the first part of his well-known Glossary, which he never carried beyond the letter L; because, as some have suggested, he had said things under "Magna charta," and "Maximum consilium," that could not then have appeared without giving offence. Upon his death all his papers came into the hands of his son Sir John Spelman, a gentleman who had abilities to have completed his father's design, if death had not prevented him. The second part was afterwards published by Sir William Dugdale; but with all the marks of a scanty unfinished performance. The next work he entered upon, was an edition of the English Councils, of which he published the first volume about two years before his death; leaving the second volume, as well of this as of his Glossary, to be published by Sir William Dugdale. Sir Henry wrote several other things, all relating to ancient laws and customs; and died in 1641. His Posthumous Works were published in folio, 1698, under the inspection of Mr Gibson,

afterwards bishop of London.

SPELTER, in metallurgy, the same with **ZINC**.

SPENSER (Edmund), was born in London, in the year 1553, and descended from an ancient family of the Spensers in Northamptonshire. All we know concerning his education is, that he was admitted a sizer of Pembroke-hall in Cambridge, and matriculated in 1569. At this time began his intimacy with Mr Gabriel Harvey, a man of genius and a poet. In 1576, having completed his degrees in arts, he left the university, as it is conjectured, for want of subsistence, and retired to the north of England. Here he had the misfortune to become enamoured of his Rosalind, who, after flattering his passion for a time, at length preferred his happier rival. Spenser continued in the country till the year 1578, when, at the persuasion of his friend Mr Harvey, he removed to London, where that gentleman introduced him to Mr Sidney, (afterward Sir Philip). Concerning his first introduction to Sir Philip, there is indeed a different story, which was first told by the writer of his life, prefixed to his works in 1679, and transcribed by Hughes, Cibber, and several others; which, nevertheless, is certainly not true. The purport of it is, that Spenser, being unknown to this Mecænas of the age, went to Leicester house, and sent in the 9th canto of the first book of the Fairy Queen; that, on reading part of it, Sir Philip ordered his steward to give the bearer 50 l.; on reading a little farther, 50 l. more; then 200 l. bidding him to make haste and pay the money, lest he should give the poet his whole estate. The story tells prettily enough; but it is very certain, that the Fairy Queen was begun long after his acquaintance with Sir Philip. By this universal patron of genius, however, he was presented to queen Elizabeth, who honoured him with the place of poet-laureat. About this time he finished his Shepherd's Calendar, which was first printed in 1579; and in the following year, being recommended by his patron to the earl of Leicester, he went to Ireland as secretary to the lord Grey of Wilton, then appointed lord lieutenant of that kingdom. Lord Grey was recalled in 1582, and with him Spenser returned to London, where he continued till after the death of Sir Philip Sidney in 1586; a loss which he bewailed to the end of his life. The following year, our poet, having obtained a royal grant of 3000 acres of forfeited lands in the county of Cork in Ireland, set out for that kingdom, took possession of his estate, and fixed his residence in the castle of Kilmolan, which had belonged to the earl of Desmond. In this retirement he resumed his great work of the Fairy Queen, and continued in Ireland till, being visited by his old friend Sir Walter Raleigh in 1589, he came over with him to England; but returned to Ireland the year following, where he fell in love with a country-girl, and married her. Soon after his marriage, he paid another visit to his native country, where we also find him in 1596. In the following year he returned once more to Kilmolan; but on the rebellion of Lord Tyrone, who ravaged the whole county of Cork, he was obliged to fly for safety with his family to England, where, in the year 1599, he died in extreme poverty. He was buried in Westminster Abbey, according to his request, near Chaucer. A monument was erected to his memory by Ann coun-

tels

Spenser
||
Spermaceti.

tefs of Dorset. We know but little of his character as a man; as a poet, considering the age in which he lived, he deserves our utmost veneration. He wrote various pieces besides those above-mentioned. His whole works, with his life by Hughes, were published in fix volumes 12mo, in 1715 and 1750.

SPENSER (Dr John), a very ingenious and learned English divine, born in Kent in 1630; who became master of Corpus Christi College, Cambridge, and afterwards dean of Ely. He published a Discourse on Prodigies, which is a truly philosophical and learned work; and another famous work *De legibus Hæbreorum ritualibus, et eorum rationibus*: and after a life spent in the closest application to his studies, died in 1695.

SPERGULA, SPURREY; a genus of the pentagynia order, belonging to the decandria class of plants. There are five species; of which the most remarkable is the arvensis, or corn-spurrey, which grows in this country in gravelly soil and corn-fields. In Holland it is cultivated as food for cattle, and has the advantage of growing on the very poorest soils; but does not afford a great deal of food. Poultry are fond of the seeds; and the inhabitants of Finland and Norway make bread of them when their crops of corn fail. Horses, sheep, goats, and swine, eat it. Cows refuse it.

SPERM, the seed whereof an animal is formed.

See SEMEN.

SPERMACETI, a white flaky substance, prepared from the brain of a species of whale called *physeter microps*. See PHYSETER.

One of these fishes affords some tuns of brains; which are first grossly freed from the oil by draining and pressing, and afterwards more perfectly purified by steeping them in a ley of alkaline salt and quick-lime, which dissolves the remains of the oily matter into a saponaceous liquid. The brains being then washed with water, appear of a silver whiteness; and nothing more is required to complete the preparation than to cut them in shivers with wooden knives, and spreading them abroad to dry. Such is the simple process by which this profitable commodity is prepared. It has been said that spermaceti is a natural concrete, found floating on the surface of the northern seas; but this is plainly a false report, perhaps calculated to prevent inquiry into the manner of its preparation. Good spermaceti is in fine white flakes, glossy and semitransparent, soft and unctuous to the touch, yet dry and easily friable; in taste somewhat like butter; of a faint smell like that of tallow. It is apt, in keeping, if not carefully secured from the air, to grow yellowish, and contract a rancid fishy smell. The more perfectly it has been purified at first, the less susceptible it is of these alterations; and after it has been changed, it may be rendered white and sweet again, by steeping it afresh in a ley of alkaline salt and quick-lime. It melts in a small degree of heat, and congeals again as it cools. Laid on burning coals, it emits a fetid smell like that of the snuff of a candle. The contact of flame does not set it on fire, but with a wick it burns equally with common tallow-candles. In distillation it totally arises, leaving no coal or *caput mortuum* behind. From four ounces were obtained three ounces and a half of oil, and a dram and a half of phlegm; the other two drams and a half having been

wafted or diffipated in the process. The oil is not a brown or black fetid empyreumatic one, like those of other animal substances, but clear, yellowish, of a butyraceous consistence, in smell like oil of wax, like which also it coagulates in the cold. Rectified spirit of wine, digested and boiled with spermaceti, takes up about half a dram out of half an ounce: greatest part settles to the bottom, and the finer particles float in the liquor, in appearance like flowers of benzoine. Water long digested or boiled with it extracts nothing. By grinding it with sugar or almonds, it becomes miscible with water, but not near so perfectly as the vegetable resins do by the same treatment: on standing for a little time, the spermaceti separates and floats on the surface. Yolks of eggs unite it more thoroughly with watery liquors; but when dissolved by these also, it soon separates and falls to the bottom. Even caustic alkaline ley does not dissolve nor unite with it into soap, as it does with all other fats; and hence the use of this ley in its preparation and purification. It mingles sufficiently with oils, fats, balsams, resins, butter, wax, &c.

SPERMATIC, in anatomy, something belonging to the sperm or seed.

SPEY, a river of Scotland, rising from a lake of the same name in Badenoch, and, after a serpentine course of 76 miles, passes by Rothes castle, and falls into the German sea at Garioch near Elgin. Mr Pennant tells us, that the Spey is a dangerous neighbour to Castle Gordon, overflowing frequently in a dreadful manner, as appears by its ravages far beyond its banks. The bed of the river is wide and full of gravel, and the channel very shifting. In 1746 the duke of Cumberland passed this river at Belly church, near Castle Gordon, when the channel was so deep as to take an officer, from whom Mr Pennant had the account, and who was six feet four inches high, up to the breast. The banks are here very high and steep; so that had not the rebels been infatuated in such a manner as to neglect opposition, the passage must have been attended with considerable loss. On this river there is a great salmon-fishery; about 1700 barrels full are caught in the season, and the shore is rented for about 1200 l. per annum.

SPHACELUS, in surgery and medicine, an absolute and perfect corruption or death of the parts.

SPHAGNUM, Bog-moss; a genus of the order of musci belonging to the cryptogama class of plants. There are three species; the most remarkable of which is the palustris, or common bog-moss, which grows on our bogs in wide patches, so that it frequently covers a large portion of their surface. The stalks are from two inches to two feet long, irregularly surrounded with numerous, conical, pendant branches, and terminated with a roscaceous cluster of erect short ones. It is generally believed, that the roots and decayed stalks of this moss constitute a principal part of that useful bituminous substance called *peat*, which is the chief fuel of the northern regions.—The Lapland matrons are well acquainted with this moss. They dry and lay it in their cradle, to supply the place of bed, bolster, and every covering; and, being changed night and morning, it keeps the infant remarkably clean, dry, and warm. It is sufficiently soft of itself; but the tender mother, not satisfied with this, frequently

Spermatic
||
Sphagnum.

covers

Sphenoides covers the mole with the downy hairs of the reindeer; and by that means makes a most delicate nest for the young babe.

Spike.

Os SPHENOIDES, the seventh bone of the cranium or skull. See ANATOMY, n° 15.

SPHERE, is a solid contained under one uniform round surface, such as would be formed by the revolution of a circle about one of its own diameters as an axis. See GEOMETRY.

Projection of the SPHERE. See PROJECTION.

SPHERE, in astronomy, that concave orb or expanse which invests our globe, and in which the heavenly bodies appear to be fixed, and at an equal distance from the eye.

The better to determine the places of the heavenly bodies in the sphere, several circles are supposed to be described on the surface thereof, hence called the *circles of the sphere*: of these some are called *great circles*, as the equinoctial, ecliptic, meridian, &c. and others *small circles*, as the tropics, parallels, &c. See GEOGRAPHY and ASTRONOMY, *passim*.

Armillary SPHERE. See GEOGRAPHY, sect. ii.

Sphere of Activity of a Body, is that determinate space or extent to which, and no farther, the effluvia continually emitted from that body reach; and where they operate according to their nature.

SPHERES, in optics, the same with metalline mirrors for telescopes or other purposes. See OPTICS, p. 5613, 5619.

SPHEROID, in geometry, a solid approaching to the figure of a sphere. It is generated by the entire revolution of a semi-ellipse about its axis.

SPHINCTER, in anatomy, a term applied to a kind of circular muscles, or muscles in form of rings, which serve to close and draw up several orifices of the body, and prevent the excretion of the contents.

SPHINX, in sculpture, &c. a figure or representation of a monster of that name, famed among the ancients, now mostly used as an ornament in gardens, terraces, &c. It is represented with the head and breasts of a woman, the wings of a bird, the claws of a lion, and the rest of the body like a dog. It is supposed to have been engendered by Typhon, and sent by Juno to be revenged on the Thebans. Its office, they say, was to propose dark enigmatical questions to all passers-by; and if they did not give the explication thereof, to devour them. It made horrible ravages, as the story goes, on a mountain near Thebes; and could not by any means be destroyed, till after Oedipus had solved the following riddle, "What animal is it that in the morning walks on four legs, at noon on two, and at night on three?" The answer was "Man."

Among the Egyptians, the sphinx was the symbol of religion, by reason of the obscurity of its mysteries: and on the same account the Romans placed a sphinx in the porch of their temples.

SPICE, any kind of aromatic drug that has hot and pungent qualities: such are pepper, nutmeg, ginger, cinnamon, cloves, &c.

Spice-Islands, in the East Indies. See BANDA, Molucca Islands, and Ceylon.

SPIDER, in zoology. See ARANEA.

SPIDERWORT, in botany. See PHALANGIUM.

SPIKE, or *Oil of SPIKE*, a name given to an essen-

tial oil distilled from lavender, and much used by the varnish-makers and the painters in enamel.

SPIKENARD, in botany. See NARDUS.

SPINA VENTOSA, in surgery, that species of corruption of the bones which takes its rise in the internal parts, and by degrees enlarges the bone, and raises it into a tumour. See SURGERY.

SPINACHIA, SPINACH; a genus of the pentandria order, belonging to the dioecia class of plants. There are two species. The common species intended for winter use should be sown on an open spot of ground in the latter end of July; observing to do it if possible when the weather is rainy. When the young plants are come up, the weeds must be destroyed, and the plants left at about five inches asunder. The ground being kept clear of weeds, the spinach will be fit for use in October. The way of gathering it to advantage is only to take off the longest leaves, leaving those in the centre to grow bigger; and at this rate a bed of spinach will furnish the table for a whole winter, till the spinach sown in spring is become fit for use, which is common in April.

SPINAGE, or SPINACH. See SPINACHIA.

SPINÆ, in botany, thorns, rigid prickles: a species of *aræa*, growing on various parts of certain plants for their defence; *spina ramorum arcent pecora*. On the branches we find examples in the pyrus, prunus, citrus, hippophaes, gmelina, rhamnus, lycium, &c.; on the leaves in the aloe, agave, yucca, ilex, hippomane, theophrasta, carlina, &c.; on the calyx, in the carduus, cnicus, centaurea, moluccella, galeopsis, &c.; on the fruit, in the trapa, tribulus, murex, spinacia, agremonia, datura, &c.

SPINAL MARROW. See ANATOMY, n° 5. 396—399.

SPINALIS, in anatomy, the name of several muscles, &c. of the spine.

SPINE, SPINA DORSI. See ANATOMY, n° 29.

SPINE, in botany. See SPINÆ.

SPINELLO, a Tuscan painter, of great repute in his time. He painted a picture of the fallen angels, in which he drew so horrid a picture of Lucifer, that it frightened him so much as to affect his senses ever after. He flourished about the year 1380.

SPINET, or SPINNETH, a musical instrument ranked in the second or third place among harmonious instruments. It consists of a chest or belly made of the most porous and resinous wood to be found, and a table of fir glued on slips of wood called *flummers*, which bear on the sides. On the table is raised two little prominences or bridges, wherein are placed so many pins as there are chords or strings to the instrument. It is played on by two ranges of continued keys, the former range being the order of the diatonic scale, and that behind the order of the artificial notes or semi-tones. The keys are so many flat pieces of wood, which, touched and pressed down at the end, make the other raise a jack which strike and sound the strings by means of the end of a crow's quill, where-with it is armed. The 30 first strings are of brass, the other more delicate ones of steel or iron-wire; they are all stretched over the two bridges already mentioned. The figure of the spinet is a long square or parallelogram; some call it an *harp-couched*, and the harp an *inverted spinet*. See the article HARP.

Spinning
||
Spinozism.

This instrument is generally tuned by the ear, which method of the practical musicians is founded on a supposition that the ear is a perfect judge of an octave and a fifth. The general rule is to begin at a certain note, as C, taken towards the middle of the instrument, and tuning all the octaves up and down, and also the fifths, reckoning seven semi-tones to each fifth, by which means the whole is tuned. Sometimes to the common or fundamental play of the spinet is added another similar one in unison, and a third in octave to the first, to make the harmony the fuller; they are either played separately or together by means of a stop; these are called *double* or *triple spinets*; sometimes a play of violins is added, by means of a bow, or a few wheels parallel to the keys, which press the strings and make the sound last as long as the musician pleases, and heighten and soften them more or less, as they are more or less pressed. The harpsichord is a kind of spinet, only with another disposition of the keys. See the article *HARPSICHORD*. The instrument takes its name from the small quill ends which touch the strings, resembling *spine*, or thorns.

SPINNING, in commerce, the act or art of reducing silk, flax, hemp, wool, hair, or other matters, into thread. Spinning is either performed on the wheel with a distaff and spindle, or with other machines proper for the several kinds of working. Hemp, flax, nettle-thread, and the like vegetable matters, are to be wetted in spinning; silks, wools, &c. are to be spun dry, and do not need water; but there is a way of spinning silk as it comes off the cafes or balls, where hot and even boiling water is to be used. See the articles *SILK*, *THREAD*, &c.

SPINOSUS CAULIS, in botany; a stem covered with strong woody prickles, whose roots are not superficial, but proceeding from the body of the stem. When applied to a leaf, *spinosum folium*, it indicates the margin running out into rigid points or prickles, *quod margine exit in acumina duriora, rigida, pungentia*.

SPINOUS, in botany. See **SPINOSUS**.

SPINOUS Fishes, such as have some of the rays of the back-fins running out into thorns or prickles, as the perch, &c.

SPINOZA (Benedict de), the son of a Portuguese Jew settled at Amsterdam, where he was born in 1633. He commenced philosopher early in life; publicly embraced Christianity, for which the Jews attempted to assassinate him; and in the end made a great noise in the world by his atheistical principles and writings. He was probably the first who reduced Atheism to a system; but in other respects his doctrine was the same with that of several philosophers both ancient and modern. He retired into the country that he might not be interrupted in his speculations, and was sometimes three months without going out of his lodgings. This retired life did not hinder his name from spreading. The free-thinkers came to him from all parts. The palatine count offered him the place of professor of philosophy at Heidelberg; but he refused it. He died at the Hague in 1677, aged about 44 years. He is said to have been honest, obliging, and very regular in his morals; which we need not be more surprised at than to see people live an irregular life though fully persuaded of the truths of the Gospel.

SPINOZISM, or **SPINOISM**, the doctrine of Spi-

noza, or Atheism and Pantheism propofed after the manner of Spinoza. See **SPINOZA**.

The great principle of Spinozism is, That there is nothing properly and absolutely existing besides matter and the modifications of matter; among which are even comprehended thought, abstract and general ideas, comparisons, relations, combinations of relations, &c.

The chief articles in Spinoza's system are reducible to these. That there is but one substance in nature, and that this only substance is endued with an infinite number of attributes, among which are extension and cogitation: that all the bodies in the universe are modifications of this substance considered as it is extended; and that all the souls of men are modifications of the same substance considered as cogitative: that God is a necessary and infinitely perfect being, and is the cause of all things that exist, but not a different being from them: that there is but one being and one nature, and that this nature produces within itself, by an immanent act, all those which we call *creatures*; and that this being is at the same time both agent and patient, efficient cause and subject; but that he produces nothing but modifications of himself.

SPIRÆA, in botany, a genus of the pentagynia order, belonging to the icofandria class of plants.—There are 12 species; of which the most remarkable are, 1. The *salicifolia*, or common *spiræa frutex*, rises with several shrubby stalks, to the height of six or eight feet. The branches are terminated by spikes of pale flowers, the lower parts of the spikes are branched out into small spikes, but the upper parts are close and obtuse. When the flowers are past, the germen changes to pointed capsules; but they seldom come to perfection. 2. The *silpendula*, or common dropwort, grows in mountainous pastures in several parts of England and Scotland. It rises about a foot and an half high, with an erect stalk, and but few leaves upon it; terminated with a loose umbel of white flowers often tinged with red. 3. The *ulmaria*, or meadow-sweet; grows naturally on the sides of waters, and in low moist meadows, in most of the northern counties of Europe. The stalks are angular, red, and rise three or four feet high; garnished with winged leaves, and terminated by large loose bunches of white flowers.—The first species is propagated by suckers, which are sent forth in plenty from the roots of the old stems, or by laying down the tender branches. The second and third species are not cultivated. However, the tuberous pea-like roots of the second, dried and reduced to powder, make a kind of bread which in times of scarcity is not to be despised. Hogs are very fond of these roots. Cows, goats, sheep, and swine, eat the plant; but horses refuse it. The flowers of the *ulmaria* have a fragrant scent, which rises in distillation. The whole plant indeed is extremely fragrant, so that the common people of Sweden threw their floors with it on holidays. It has also an astringent quality, and thus has been found useful in dysenteries, ruptures, and in tanning of leather. Goats are extremely fond of it; cows and horses refuse it.

SPIRAL, in geometry, a curve line of the circular kind, which in its progress recedes from its centre.

SPIRE, in architecture, was used by the ancients
for

Spiræ
||
Spire.

Spirit
||
Splicing.

for the base of a column, and sometimes for the affrugal or tore; but among the moderns it denotes a fceptle that continually diminishes as it ascends, whether conically or pyramidally.

SPIRIT, in metaphysics, an incorporeal being or intelligence; in which sense God is said to be a spirit, as are angels and the human soul. See **METAPHYSICS**, n° 5, 106, 109.

SPIRIT, in chemistry and pharmacy, a name applied to every volatile liquid which is not insipid like phlegm or water; and hence the distinction into acid, alkaline, and vinous spirits. See (*Index to*) **PHARMACY**.

SPIRIT of Wine. See **DISTILLATION**; and **PHARMACY**, n° 446, 682.

SPIRITS, or **ANIMAL SPIRITS**; in physiology. See **ANATOMY**, n° 400.

Acid SPIRITS. See **PHARMACY**, p. 6078.

Alkaline SPIRITS, solutions of volatile alkaline salt in water, sometimes with a portion of empyreumatic oil; in which case they receive different appellations, as *spirit of hartshorn*, of *wine*, &c. If the volatile alkali contained in these solutions be united with a considerable quantity of fixed air, the spirit effervesces with an acid, and is called a *mild spirit*; but if the alkali is deprived of its fixed air, the spirit is said to be *caustic*, and raises no effervescence. The mild spirits, though to the smell they appear much weaker than the caustic, are in reality stronger, as containing a larger proportion of alkali than the latter commonly do. However, there is no alkaline spirit perfectly mild, or it would be entirely neutralized by the fixed air, so that no alkaline smell or taste could be perceived. All mild spirits therefore are partly caustic, to which they owe that degree of smell and pungent taste which they retain. However, being already partly neutralized, they are much less apt to imbibe fixed air than such as have none at all; the solution of the neutral salt composed of volatile alkali and fixed air also is much more apt to retain the alkaline air or caustic salt than pure water; and hence the mild alkaline spirits preserve a much more equable degree of strength than the caustic ones, which partly by the attraction of fixed air, and partly by evaporation, unless very firmly secured, very soon become sensibly weaker both in taste and smell than when originally made.

SPIRITUAL, in general, something belonging to or partaking of the nature of spirit. See **SPIRIT**.

SPIRITUALITIES of a Bishop, are the profits he receives as a bishop, and not as a baron of parliament; such are the duties of his visitation, presentation-money, what arises from the institution and ordination of priests, the income of his jurisdiction, &c.

SPITHEAD, a road between Portsmouth and the Isle of Wight, where the royal navy of Great Britain frequently rendezvous.

SPITTLE, in physiology. See **SALIVA**.

SPITZBERGEN. See **GROENLAND**.

SPLEEN, in anatomy. See there, n° 360.

Spleen Wort. See **ASPENIUM**.

SPLENETIC, a person afflicted with an obstruction of the spleen.

SPLINT, or **SPLINT**, among farriers, a callous insensible excrescence, breeding on the shank-bone of horses. See **FARRIER**, § xxix.

SP LICING, in the sea-language, is the untwisting

the ends of two cables or ropes, and working the several strands into one another by a sidd, so that they become as strong as if they were but one rope.

SPOILS, whatever is taken from the enemy in time of war. Among the ancient Greeks, the spoils were divided among the whole army; only the general's share was largest: but, among the Romans, the spoils belonged to the republic.

SPOLETO, a duchy of Italy, bounded on the north by the Marche of Ancona and duchy of Urbino, on the east by Farther Abruzzo, on the south by Sabina and the patrimony of St Peter, and on the west by Orvietano and Perruggino. It is about 55 miles in length and 40 in breadth. It was anciently a part of Umbria, and now belongs to the Pope.—The name of the capital city is also *Spoletto*. It was formerly a large place, but in 1703 was ruined by an earthquake; from whence it has never recovered itself.

SPOILIATION, in ecclesiastical law, is an injury done by one clerk or incumbent to another, in taking the fruits of his benefice without any right thereunto, but under a pretended title. It is remedied by a decree to account for the profits so taken. This injury, when the *jus patronatus*, or right of advowson, doth not come in debate, is cognizable in the spiritual court: as if a patron first presents A to a benefice, who is instituted and inducted thereto; and then, upon pretence of a vacancy, the same patron presents B to the same living, and he also obtains institution and induction. Now if A disputes the fact of the vacancy, then that clerk who is kept out of the profits of the living, whichever it be, may sue the other in the spiritual court for spoliation, or taking the profits of his benefice. And it shall there be tried, whether the living were or were not vacant; upon which the validity of the second clerk's pretensions must depend. But if the right of patronage comes at all into dispute, as if one patron presented A, and another patron presented B, there the ecclesiastical court hath no cognizance, provided the tithes sued for amount to a fourth part of the value of the living, but may be prohibited at the instance of the patron by the king's writ of *indicavit*. So also if a clerk, without any colour of title, ejects another from his parsonage, this injury must be redressed in the temporal courts: for it depends upon no question determinable by the spiritual law, (as plurality of benefices or no plurality, vacancy or no vacancy), but is merely a civil injury.

SPON (James), was the son of Charles Spon, an eminent French physician, and born at Lyons in 1647. After an education of great care, he was admitted a doctor of physic at Montpellier in 1667, and a member of the college of physicians at Lyons in 1669. Mr Vailant, the king's antiquary, passing through Lyons to Italy in quest of medals and other antiquities, Mr Spon accompanied him. He afterward, in the years 1675 and 1676, made a voyage to Dalmatia, Greece, and the Levant, in company with Sir George Wheeler an English gentleman: but whether his constitution was naturally weak, or he had hurt himself in this tour, does not appear, but he never after enjoyed his health. Being of the reformed religion, he was forced to leave France on the revocation of the edict of Nantz; and died at Vevay, a town on the lake Lemán, in 1686. He was the author of many valuable works which

Spoils
||
Spon.

Spondanus were printed at Lyons; the principal of which are, 1. His travels into Italy, Dalmatia, Greece, and the Levant. 2. An answer to M. Guillet's Criticisms on his Travels. 3. Curious antiquities, in quarto. 4. A history of Geneva; all the above are in French. 5. *Miscellanea eruditae antiquitatis*, folio, &c.

SPONDANUS (Henricus), or *Henry de SPONDE*, was born in 1568, and educated at Ortez, where the reformed had a college, and where he distinguished himself early by his facility in acquiring the Latin and Greek languages. He applied himself to the study of the civil and canon law; and in the mean time read the controversial works of Bellarmine and Perron with such eagerness, that, after the example of his brother John, he forsook the Protestant religion. He made his abjuration at Paris in 1595, took priests orders at Rome in 1606, and was made bishop of Pamiers by Lewis XIII. in 1626. His intimacy with Baronius while he was in Italy, suggested to him the design of abridging his *Annales ecclesiastici*; which he executed with the author's consent, and continued them from the year 1197, where Baronius left off, to the year 1640. He published also, in folio, *Annales sacri à mundi creatione ad ejusdem redemptionem*; with some smaller works; and died in 1643.

SPONDEE, in ancient poetry, a foot consisting of two long syllables, as *omnes*.

SPONDIAS, the **JAMAICA PLUM**; a genus of the pentagynia order, belonging to the decandria class of plants. There are two species: 1. The purpurea, or purple myrabolin plum, is a native of the West Indies, where it rises to the height of 12 or 14 feet, but in this country is seldom found more than half that height. The flowers terminate the branches in a racemus, and are of a whitish yellow colour. Some of them are succeeded by oblong fleshy berries of a pale yellow colour, covered with a mealy farina; the flesh of which is thin, but of a sweet luscious taste. The inclosed nut appears as if composed of many ligneous fibres. 2. The lutea, with neat leaves and yellow fruit, is a native of the warmest parts in America, where it rises to the height of 30 feet, sending out many irregular branches, which are destitute of leaves for some months. The flowers come out before the leaves appear, and are succeeded by yellow plums an inch and an half long. Both these species are propagated by fruit or by cuttings. The fruit is much esteemed, but the plums yield little meat; however, the wild hogs are very fond of them, and they are their principal food during the season of their ripening.

SPONGIA, **SPURGE**; a genus belonging to the order of vermes zoophyta. The whole texture is a congeries of bibulous cells. There are six species, all found in the bottom of the sea, and on submarine rocks. Sponges are much used by surgeons and others for sucking up superfluous moisture, which they easily part with by pressure.

SPONSORS, among Christians, are those persons who, in the office of baptism, answer or are surerties for the persons baptized.

SPONTANEOUS, a term applied to such motions of the body and operations of the mind as we perform of ourselves without any constraint.

SPOON-BILL, in ornithology. See **PLATEA**.

SPOONING, in the sea-language, is said of a ship, which being under fail in a storm at sea, is unable to bear it, and consequently forced to go right before the wind.

SPORADES, among ancient astronomers, a name given to such stars as were not included in any constellation.

SPORADIC DISEASES, among physicians, are such as seize particular persons at any time or season, and in any place; in which sense they are distinguished from epidemical and endemical diseases.

SPOTS, in astronomy, certain places of the sun's or moon's disk, observed to be either more bright or dark than the rest; and accordingly called *pecula* or *maculae*. See **ASTRONOMY**, n° 33—39.

SPOTSWOOD (John), archbishop of St Andrew's in Scotland, was descended from the lairds of Spotswood in the Merse, and was born in the year 1565. He was educated in the university of Glasgow, and succeeded his father in the parsonage of Calder when but 18 years of age. In 1601 he attended Lodowick duke of Lenox as his chaplain, in an embassy to the court of France for confirming the ancient amity between the two nations, and returned in the ambassador's retinue through England. When he entered into the archbishopric of Glasgow, he found there was not 100 l. Sterling of yearly revenue left; yet such was his care for his successors, that he greatly improved it, and much to the satisfaction of his diocese. After having filled this see eleven years, he was raised to that of St Andrew's in 1615, and made primate and metropolitan of all Scotland. He presided in several assemblies for restoring the ancient discipline, and bringing the church of Scotland to some sort of uniformity with that of England. He continued in high esteem with king James I. nor was he less valued by king Charles I. who was crowned by him in 1633, in the abbey-church of Holyroodhouse. In 1635, upon the death of the earl of Kinnoul chancellor of Scotland, our abbot was advanced to that post; but had scarcely held it four years, when the confusions beginning in Scotland, he was obliged to retire into England; and being broken with age, grief, and sickness, died at London in 1639, and was interred in Westminster-abbey. He wrote a history of the church of Scotland, from the year 203 to the reign of king James VI. in folio.

SPOUT, or **Water-SPOUT**. See **WATER-SPOUT**.

SPRANGHER (Bartholomew), a German painter, born at Antwerp in 1546. He was brought up under a variety of masters, and then went to Rome, where cardinal Farnese took him into his service, and afterwards recommended him to Pope Pius V. He was employed at Belvedere, and worked two years and ten months in drawing the picture of the Last Judgment; this piece, which contained 500 heads, was so highly valued, that, after the death of Pius, it was placed over his monument as its principal ornament. From Rome he entered into the service of the emperors Maximilian and Rudolphus II. by whom he was exceedingly cherished and honoured: the latter in 1588 ennobled him and his descendants, and in the presence of his whole court placed a chain of gold of three rows round the neck of the artist, and ordered him to wear it as long as he lived. He died in 1623; and

Spooning
Sprangher

and as he worked mostly for princes and nobles, his works are not frequently to be bought.

SPRAT (Dr Thomas), bishop of Rochester, was born in 1636. He had his education at Oxford, and after the Restoration entered into holy orders. He became fellow of the Royal Society, chaplain to George duke of Buckingham, and chaplain in ordinary to king Charles II. In 1667, he published the History of the Royal Society, and a Life of Mr Cowley; who, by his last will, left to his care his printed works and MSS. which were accordingly published by him. In 1668, he was installed prebendary of Westminster; in 1683, was appointed canon of Windsor, and dean of Westminster; and in 1684, consecrated to the bishopric of Rochester. He was clerk of the closet to king James II.; in 1685, was made dean of the chapel royal; and the year following, was appointed one of the commissioners for ecclesiastical affairs. In 1692, his lordship, with several other persons, was charged with treason by two men, who forged an association under their hands, of which the bishop published an account. He died of an apoplexy in 1713. His writings are greatly admired for elegance of style.

SPRAT, in ichthyology. See **CLUPEA**.

SPRAY, the sprinkling of the sea, which is driven from the top of a wave in stormy weather. It differs from spoon-drift, as being only blown occasionally from the broken surface of a high wave; whereas the latter continues to fly horizontally along the sea, without intermission, during the excess of a tempest or hurricane.

SPRING, in natural history, a fountain or source of water rising out of the ground.

Many have been the conjectures of philosophers concerning the origin of fountains, and great pains have been taken both by the members of the Royal Society and those of the Academy of Sciences at Paris, in order to ascertain the true cause of it. It was Aristotle's opinion, and held by most of the ancient philosophers after him, that the air contained in the caverns of the earth, being condensed by cold near its surface, was thereby changed into water; and that it made its way through, where it could find a passage. But we have no experience of any such transmutation of air into water.

Those who imagine that fountains owe their origin to waters brought from the sea by subterraneous ducts, give a tolerable account how they lose their saltness by percolation as they pass through the earth: but they find great difficulty in explaining by what power the water rises above the level of the sea to near the tops of mountains, where springs generally abound; it being contrary to the laws of hydrostatics, that a fluid should rise in a tube above the level of its source. However, they have found two ways whereby they endeavour to extricate themselves from this difficulty. The one is that of Des Cartes, who imagines, that after the water is become fresh by percolation, it is raised out of the caverns of the earth in vapour towards its surface; where meeting with rocks near the tops of mountains in the form of arches or vaults, it sticks to them, and runs down their sides, (like water in an Alembic), till it meets with proper receptacles, from which it supplies the fountains. Now this is a

mere hypothesis, without foundation or probability: for, in the first place, we know of no internal heat of the earth to cause such evaporation; or if that were allowed, yet it is quite incredible, that there should be any caverns so smooth and void of protuberances, as to answer the ends of an alembic, in collecting and condensing the vapours together in every place where fountains arise. There are others (as Varenus, &c.) who suppose that the water may rise through the pores of the earth, as through capillary tubes by attraction. But hereby they show, that they are quite unacquainted with what relates to the motion of a fluid through such tubes: for when a capillary tube opens into a cavity at its upper end, or grows larger and larger, so as to cease to be capillary at that end, the water will not ascend through that tube into the cavity, or beyond where the tube is capillary; because that part of the periphery of the cavity, which is partly above the surface of the water and partly below it, is not of the capillary kind. Nay, if the cavity is continually supplied with water, it will be attracted into the capillary tube, and run down it as through a funnel, if the lower end is emerged in the same fluid, as in this case it is supposed to be.

It has been a generally received opinion, and much espoused by Mariotte, (a diligent observer of nature), that the rise of springs is owing to the rains and melted snow. According to him, the rain-water which falls upon the hills and mountains, penetrating the surface, meets with clay or rocks contiguous to each other; along which it runs, without being able to penetrate them, till, being got to the bottom of the mountain, or to a considerable distance from the top, it breaks out of the ground, and forms springs.

In order to examine this opinion, Mr Perrault, De la Hire, and D. Sideleau, endeavoured to make an estimate of the quantity of rain and snow that falls in the space of a year, to see whether it would be sufficient to afford a quantity of water equal to that which is annually discharged into the sea by the rivers. The result of their inquiries was, that the quantity of rain and snow which fell in a year into a cylindrical vessel, would fill it (if secured from evaporating) to the height of about nineteen inches. Which quantity D. Sideleau showed, was not sufficient to supply the rivers; for that those of England, Ireland, and Spain, discharge a greater quantity of water annually, than the rain, according to that experiment, is able to supply. Besides which, another observation was made by them at the same time, viz. that the quantity of water raised in vapour, one year with another, amounted to about thirty-two inches, which is thirteen more than falls in rain: a plain indication that the water of fountains is not supplied by rain and melted snow.

Thus the true cause of the origin of fountains remained undiscovered, till Dr Halley, in making his celestial observations upon the tops of the mountains at St Helena, about 800 yards above the level of the sea, found, that the quantity of vapour which fell there (even when the sky was clear) was so great, that it very much impeded his observations, by covering his glasses with water every half quarter of an hour: and upon that he attempted to determine by experiment the quantity of vapour exhaled from the surface of the

sea, as far as it rises from heat; in order to try whether that might be a sufficient supply for the water continually discharged by fountains. The process of his experiment was as follows: He took a vessel of water falted to the same degree with that of sea-water, in which he placed a thermometer; and by means of a pan of coals, brought the water to the same degree of heat, which is observed to be that of the air in our hottest summer; this done, he fixed the vessel of water with the thermometer in it, to one end of a pair of scales, and exactly counterpoised it with weights on the other: then, at the end of two hours, he found, by the alteration made in the weight of the vessel, that about a sixtieth part of an inch of the depth of the water was gone off in vapour; and therefore, in twelve hours, one-tenth of an inch would have gone off. Now this accurate observer allows the Mediterranean Sea to be forty degrees long, and four broad, (the broader parts compensating for the narrower, so that its whole surface is 160 square degrees); which, according to the experiment, must yield at least 5,280,000,000 tons of water: In which account no regard is had to the wind and the agitation of the surface of the sea; both which undoubtedly promote the evaporation.

It remained now to compare this quantity of water with that which is daily conveyed into the same sea by the rivers. The only way to do which, was to compare them with some known river; and accordingly he takes his computation from the river Thames; and, to avoid all objections, makes allowances, probably greater than what were absolutely necessary.

The Mediterranean receives the following considerable rivers, viz. the Iberus, the Rhone, the Tyber, the Po, the Danube, the Niefer, the Borythenes, the Tanais, and the Nile. Each of these he supposes to bring down ten times as much water as the Thames; whereby he allows for smaller rivers which fall into the same sea. The Thames, then, he finds by mensuration to discharge about 20,300,000 tons of water a-day. If therefore the above-said nine rivers yield ten times as much water as the Thames doth, it will follow, that all of them together yield but 1827 millions of tons in a day; which is but little more than one-third of what is proved to be raised in vapour out of the Mediterranean in the same time. We have therefore from hence a source abundantly sufficient for the supply of fountains.

Now having found, that the vapour exhaled from the sea is a sufficient supply for the fountains, he proceeds in the next place to consider the manner in which they are raised; and how they are condensed into water again, and conveyed to the sources of springs.

In order to this he considers, that if an atom of water was expanded into a shell of bubble, so as to be ten times as big in diameter as when it was water, that atom would become specifically lighter than air; and therefore would rise so long as the warmth which first separated it from the surface of the water should continue to distend it to the same degree; and consequently, that vapours may be raised from the surface of the sea in that manner, till they arrive at a certain height in the atmosphere, at which they find air of equal specific gravity with themselves. Here they

will float, till being condensed by cold, they become specifically heavier than the air, and fall down in dew; or being driven by the winds against the sides of mountains, (many of which far surpass the usual height to which the vapours would of themselves ascend), are compelled by the stream of the air to mount up with it to the tops of them; where being condensed into water, they presently precipitate, and gleeing down by the crannies of the stones, part of them enters into the caverns of the hills; which being once filled, all the overplins of water that comes thither, runs over by the lowest place, and breaking out by the sides of the hills, forms single springs. Many of these running down by the valleys between the ridges of the hills, and coming to unite, form little rivulets or brooks: many of these again meeting in one common valley, and gaining the plain ground, being grown less rapid, become a river; and many of these being united in one common channel, make such streams as the Rhine and the Danube; which latter, he observes, one would hardly think to be a collection of water condensed out of vapour, unless we consider how vast a tract of ground that river drains, and that it is the sum of all those springs which break out on the south side of the Carpathian mountains, and on the north side of the immense ridge of the Alps, which is one continued chain of mountains from Switzerland to the Black Sea.

Thus one part of the vapours which are blown on the land is returned by the rivers into the sea from whence it came. Another part falls into the sea before it reaches the land; and this is the reason why the rivers do not return so much water into the Mediterranean as is raised in vapour. A third part falls on the low-lands, and is the pabulum of plants: where yet it does not rest; but is again exhaled in vapour by the action of the sun, and is either carried by the winds to the sea to fall in rain or dew there, or else to the mountains to become the sources of springs.

However, it is not to be supposed, that all fountains are owing to one and the same cause; but that some proceed from rain and melted snow, which subsiding through the surface of the earth, makes its way into certain cavities, and thence issues out in the form of springs; because the waters of several are found to increase and diminish in proportion to the rain which falls: that others again, especially such as are salt, and spring near the sea-shore, owe their origin to sea-water percolated through the earth; and some to both these causes: though, without doubt, most of them, and especially such as spring near the tops of high mountains, receive their waters from vapours, as before explained.

This reasoning of Dr Halley's is confirmed by more recent observations and discoveries. It is now found, that though water is a tolerable conductor of the electric fluid, dry earth is an electric *per se*; consequently the dry land must always be in an electrified state compared with the ocean, unless in such particular cases as are mentioned under the article EARTHQUAKE, n° 39. It is also well known, that such bodies as are in an electrified state, whether *plus* or *minus*, will attract vapour, or other light substances that come near them. Hence the vapours that are raised from the ocean must necessarily have a tendency

Spring
||
Spruce.

to approach the land in great quantity, even without the assistance of the wind; though this last must undoubtedly contribute greatly towards the same purpose, as Dr Halley justly observes. In like manner, the higher grounds are always in a more electrified state than the lower ones: and hence the vapours having once left the ocean and approached the shore, are attracted by the high mountains; of which Mr Pennant gives an instance in Snowdon. Hence we may see the reason why springs are so common in the neighbourhood of mountains, they being so advantageously formed in every respect for collecting and condensing the vapours into water.

There is a certain species of springs which ebb and flow alternately, and some that cease to flow for a time, which from thence are called *reciprocating* or *intermitting springs*. Their reciprocations are accounted for under *HYDROSTATICS*, n° 21.

SPRING, in mechanics, denotes a thin piece of tempered steel, or other elastic substance, which being wound up, serves to put several machines in motion by its elasticity, or endeavour to unbend itself: such is the spring of a watch, clock, or the like.

SPRING, *Ver*, in cosmography, denotes one of the seasons of the year; commencing in the northern parts of the world, on the day the sun enters the first degree of Aries, which is about the 10th day of March, and ending when the sun leaves Gemini: Or, more strictly and generally, the spring begins on the day when the distance of the sun's meridian altitude from the zenith, being on the increasing hand, is at a medium between the greatest and least. The end of the spring coincides with the beginning of summer. See *SUMMER*.

SPRING-Tide. See *ASTRONOMY*, n° 164.

Burning Springs. See *BURNING Springs*.

SPRIT, a small boom or pole which crosses the fall of a boat diagonally, from the mast to the upper hindmost corner of the sail, which it is used to extend and elevate: the lower end of the sprit rests in a sort of wreath or collar called the *smutter*, which encircles the mast in that place. These sort of sails are accordingly called *sprit-fails*.

SPRITSAIL, a sail attached to a yard which hangs under the bowprit, as represented in fig. 2. y, Plate CCLX. It is furnished with a large hole in each of its lower corners, to evacuate the water with which the cavity or belly of it is frequently filled by the surge of the sea when the ship pitches.

SPRITSAIL-Topfail, a fail extended above the former, by a yard which hangs across the jib-boom. The lower corners of this fail are hauled home to the spritfail-yard-arms; after which the fail is drawn out towards the extremity of the boom, in light winds, as any other topfail-yard is hoisted upon its mast.

Formerly the spritfail-topfails were set on a mast which was erected perpendicularly on the end of the bowprit: but this method has of late been justly rejected as inconvenient and dangerous to the bowprit, although serviceable in light breezes.

SPRUCE-TREE of New Zealand, a very beautiful tree, conspicuous on account of its pendant branches, which are loaded with numerous long thread-like leaves, of a vivid green. It frequently grows to the height of 50 or 60, or even of 100 feet, and above

ten in circumference. This tree proved very useful to captain Cook's people while on the island of New Zealand, who found that a wholesome and palatable liquor might be brewed from it as a substitute for spruce-beer. With the addition of some inspissated wort and molasses, they brewed a very good sort of beer; which they afterwards improved considerably, by correcting the too great astringency of the spruce with an equal quantity of the new tea-tree *. Its taste was pleasant, and something bitter; its only fault was, that, when taken on an empty stomach, it caused a nausea or sickness. Mr Forster regrets that New Zealand was visited at such unfavourable seasons that he could never find the spruce-tree either in flower or in fruit, so that he could not give a botanical description of it.

SPUNGE, or *SPONGE*. See *SPONGIA*.

SPUNGING, in gunnery, the cleaning a gun's inside with a sponge, in order to prevent any sparks of fire from remaining in her, which would endanger the life of him that should load her again.

SPUN YARN, among sailors, is a kind of line made from rope yarn, and used for seizing or fastening things together.

SPUNK, in botany. See *BOLETUS*.

SPUR, a piece of metal consisting of two branches encompassing a horseman's heel, and a rowel in form of a star, advancing out behind to prick the horse.

SPURGE, in botany. See *EUPHORBIA*.

SPURGE-Laurel. See *DAPHNE*.

SPY, a person hired to watch the actions, motions, &c. of another; particularly what passes in a camp. When a spy is discovered, he is hanged immediately.

SQUADRON, in military affairs, denotes a body of horse whose number of men is not fixed; but is usually from 100 to 200.

SQUADRON of Ships, either implies a detachment of ships employed on any particular expedition, or the third part of a naval armament.

SQUADS, in a military sense, are certain divisions of a company into so many squads, generally into three or four. The use of forming companies into as many squads of inspection as it has sergeants and corporals, is proved by those regiments who have practised that method; as by it the irregularity of the soldiers is considerably restrained, their dress improved, and the discipline of the regiment in general most remarkably forwarded. Every officer should have a roll of his company by squads.

SQUALL, a sudden and violent blast of wind, usually occasioned by the interruption and reverberation of the wind from high mountains. These are very frequent in the Mediterranean, particularly that part of it which is known by the name of the *Levan*, as produced by the repulsion and new direction which the wind meets with in its passage between the various islands of the Archipelago.

SQUALUS, the *SHARK-KIND*; a genus belonging to the order of amphibia nantes. There are five spiracula, one on each side of the neck, the body is somewhat oblong and cylindrical; and the mouth is situated in the anterior part of the head. There are 15 species, all inhabitants of the ocean. The most remarkable are,

1. The *squatina*, or angel-fish, has a large head; teeth broad at their base, but slender and very sharp

above,

Sponge
||
Squalus.

* See Tea-tree of New Zealand.

Squalus.

above, and disposed in five rows all round the jaws. Like those of all sharks, they are capable of being raised or depressed by means of muscles uniting them to the jaws, not being lodged in sockets as the teeth of cetaceous fish are. The back is of a pale ash-colour, and very rough; along the middle is a prickly tuberculated line: the belly is white and smooth. The pectoral fins are very large, and extend horizontally from the body to a great distance; they have some resemblance to wings, whence its name. The ventral fins are placed in the same manner, and the double penis is placed in them; which forms another character of the males in this genus.

This is the fish which connects the genus of rays and sharks, partaking something of the character of both; yet is an exception to each in the situation of the mouth, which is placed at the extremity of the head. It is a fish not unfrequent on most of our coasts, where it prowls about for prey like others of the kind. It is extremely voracious; and, like the ray, feeds on flounders and flat fish, which keep at the bottom of the water. It is extremely fierce, and dangerous to be approached. Mr Pennant mentions a fisherman whose leg was terribly tore by a large one of this species, which lay within his nets in shallow water, and which he went to lay hold of incautiously. The aspect of these, as well as the rest of the genus, have much malignity in them: their eyes are oblong, and placed lengthwise in their head, sunk in it, and overhung by the skin, and seem fuller of malevolence than fire. Their skin is very rough; the ancients made use of it to polish wood and ivory, as we do at present that of the greater dog-fish. The flesh is now but little esteemed on account of its coarseness and rankness; yet Archæstratus, (as quoted by Athenæus, p. 319.), speaking of the fish of Miletus, gives this first the place, in respect to its delicacy, of the whole cartilaginous tribe. They grow to a great size; being sometimes near an hundred weight.

2. The spinax, or picked dog-fish, takes its name from a strong and sharp spine placed just before each of the back-fins, distinguishing it at once from the rest of the British sharks. The nose is long, and extends greatly beyond the mouth, but is blunt at the end. The teeth are disposed in two rows, are small and sharp, and bend from the middle of each jaw towards the corners of the mouth. The back is of a brownish ash-colour; the belly white.—It grows to the weight of about 20 pounds.

This species swarms on the coasts of Scotland, where it is taken, split, and dried; and is a food among the common people. It forms a sort of internal commerce, being carried on women backs 14 or 16 miles up the country, and sold or exchanged for necessaries.

3. The maximus, basking shark, or the sun-fish of the Irish. This species has been long known to the inhabitants of the south and west of Ireland and Scotland, and those of Caernarvonshire and Anglesea; but having never been considered in any other, than a commercial view, is described by no English writer except Mr Pennant; and, what is worse, mistaken for and confounded with the luna of Rondeletius, the fame that our English writers call the *sun-fish*. The Irish and Welsh give it the same name, from its lying as if to sun itself on the surface of the water; and for the same

Squalus.]

reason Mr Pennant calls it the *basking shark*. It was long taken for a species of whale, till Mr Pennant pointed out the branchial orifices on the sides, and the perpendicular site of the tail.—These are migratory fish, or at least it is but in a certain number of years that they are seen in multitudes on the Welsh seas, though in most summers a single, and perhaps strayed, fish, appears. They inhabit the northern seas, even as high as the arctic circle. They visited the bays of Caernarvonshire and Anglesea in vast shoals in the summers of 1756 and a few succeeding years, continuing there only the hot months; for they quitted the coast about Michaelmas, as if cold weather was disagreeable to them. Some old people say they recollect the same sort of fish visiting these seas in vast numbers about 40 years ago. They appear in the Frith of Clyde, and among the Hebrides, in the month of June, in small droves of seven or eight, but oftener in pairs. They continue in those seas till the latter end of July, when they disappear.

They have nothing of the fierce and voracious nature of the shark kind, and are so tame as to suffer themselves to be stroked: they generally lie motionless on the surface, commonly on their bellies, but sometimes, like tired swimmers, on their backs. Their food seemed to consist entirely of sea-plants, no remains of fish being ever discovered in the stomachs of numbers that were cut up, except some green stuff, the half-digested parts of algae, and the like. Linnæus says it feeds on medusæ.

At certain times, they are seen sporting on the waves, and leaping with vast agility several feet out of the water. They swim very deliberately, with the dorsal fins above water. Their length is from three to twelve yards, and sometimes even longer. Their form is rather slender, like others of the shark kind. The upper jaw is much longer than the lower, and blunt at the end. The tail is very large, and the upper part remarkably longer than the lower. The colour of the upper part of the body is a deep leaden; the belly white. The skin is rough like shagreen, but less so on the belly than the back. Within-side the mouth, towards the throat, is a very short sort of whalebone. The liver is of a great size, but that of the female is the largest; some weighs above 1000 pounds, and yield a great quantity of pure and sweet oil, fit for lamps, and also much used to cure bruises, burns, and rheumatic complaints. A large fish has afforded to the captors a profit of 20l. They are viviparous; a young one about a foot in length being found in the belly of a fish of this kind. The measurements of one found dead on the shore of Loch Ranza in the isle of Arran were as follows: The whole length, 27 feet 4 inches: first dorsal fin, 3 feet; second, 1 foot: pectoral fin, 4 feet; ventral, 2 feet: the upper lobe of the tail, 5 feet; the lower, 3.

They will permit a boat to follow them, without accelerating their motion till it comes almost within contact; when a harpooner strikes his weapon into them, as near to the gills as possible. But they are often so insensible as not to move till the united strength of two men have forced in the harpoon deeper. As soon as they perceive themselves wounded, they fling up their tail and plunge headlong to the bottom; and fre-

Squalus. frequently coil the rope round them in their agonies, attempting to disengage the harpoon from them by rolling on the ground, for it is often found greatly bent. As soon as they discover that their efforts are in vain, they swim away with amazing rapidity, and with such violence, that there has been an instance of a vessel of 70 tons having been towed away against a fresh gale. They sometimes run off with 200 fathoms of line, and with two harpoons in them; and will employ the fishers for 12, and sometimes for 24, hours before they are subdued. When killed, they are either hauled on shore, or, if at a distance from land, to the vessel's side. The liver (the only useful part) is taken out, and melted into oil in kettles provided for that purpose. A large fish will yield eight barrels of oil, and two of worthless sediment.

4. The carcharias, or white shark, grows to a very great bulk, Gillius says to the weight of 4000 pounds: and that in the belly of one was found a human corpse entire; which is far from incredible, considering their vast greediness after human flesh. The mouth of this fish is furnished with (sometimes) a sixfold row of teeth, flat, triangular, exceedingly sharp at their edges, and finely serrated. Mr Pennant has one that is rather more than an inch and a half long. Grew says, that those in the jaws of a shark two yards in length are not half an inch; so that the fish to which this tooth belonged must have been six yards long, provided the teeth and body keep pace in their growth.

This dreadful apparatus, when the fish is in a state of repose, lie quite flat in the mouth; but when he seizes his prey, he has power of erecting them by the help of a set of muscles that join them to the jaw. The mouth is placed far beneath; for which reason these, as well as the rest of the kind, are said to be obliged to turn on their backs to seize their prey; which is an observation as ancient as the days of Pliny. The eyes are large; the back broad, flat, and shorter than that of other sharks. The tail is of a semilunar form, but the upper part is longer than the lower. It has vast strength in the tail, and can strike with great force; so that the sailors instantly cut it off with an axe as soon as they draw one on board. The pectoral fins are very large, which enables it to swim with great swiftness. The colour of the whole body and fins is a light ash. The ancients were acquainted with this fish; and Oppian gives a long and entertaining account of its capture. Their flesh is sometimes eaten, but is esteemed coarse and rank.—They are the dread of the sailors in all hot climates, where they constantly attend the ships in expectation of what may drop overboard: a man that has that misfortune perishes without redemption; they have been seen to dart at him like gudgeons to a worm. A master of a Guinea ship informed Mr Pennant, that a rage of suicide prevailed among his new-bought slaves, from a notion the unhappy creatures had, that after death they should be restored again to their families, friends, and country. To convince them at least that they should not reanimate their bodies, he ordered one of their corpses to be tied by the heels to a rope and lowered into the sea; and though it was drawn up again as fast as the united force of the crew could be exerted, yet in that short space the sharks had devoured every part but the feet, which were secured at the end of the cord.

Swimmers very often perish by them; sometimes they lose an arm or leg, and sometimes are bit quite asunder, serving but for two morrels for this ravenous animal: a melancholy tale of this kind is related in a West-India ballad, preserved in Dr Percy's Relics of ancient English Poetry.

5. The glaucus, or blue shark, is of an oblong form: the nose extends far beyond the mouth: it wants the orifices behind the eyes, which are usual in this genus: the nostrils are long, and placed transversely. Artdi remarks a triangular dent in the lower part of the back. The skin is smoother than that of other sharks: the back is of a fine blue colour; the belly of a silvery white. Linnæus says, that its teeth are granulated. Rondeletius says he was an eye-witness to its fondness for human flesh: that these fish are less destructive in our seas, is owing to the coolness of the climate, which is well known to abate the fierceness of some, as well as the venom of other animals.

6. The long-tailed shark, or sea-fox, is most remarkable for the great length of the tail: the whole measure of one examined by Mr Pennant being 13 feet, of which the tail alone was more than six, the upper lobe extending greatly beyond the lower, almost in a straight line. The body was round and short: the nose short, but sharp-pointed: the eyes large, and placed immediately over the corners of the mouth, which was small, and not very distant from the end of the nose. The teeth triangular, small for the size of the fish, and placed in three rows. The back ash-colour; the belly white; the skin universally smooth.

The ancients styled this fish *αλφις*, and *υλπις*, from its supposed cunning. They believed, that when it had the misfortune to have taken a bait, it swallowed the hook till it got at the cord, which it bit off, and so escaped. They are sometimes taken in our seas, and have been imagined to be the fish called the *thresher*, from its attacking and beating the grampus with its long tail, whenever that species of whale rises to the surface to breathe.

7. The canicula, or spotted shark.—The weight of one examined by Mr Pennant was six pounds three ounces, and yet it measured three feet eight inches in length; so light are the cartilaginous fish in respect to their size. The nose was short and very blunt, not extending above an inch and an half beyond the mouth. The nostrils were large, placed near the mouth, and covered with a large angular flap: the head very flat. The eyes were oblong, behind each a large orifice opening to the inside of the mouth. The teeth small, sharp, smooth at their sides, straight, and disposed in four rows. The tail was finned, and below extended into a sharp angle. The colour of the whole upper part of the body and the fins was brown, marked with numbers of large distinct black spots: some parts of the skin were tinged with red; the belly was white. The whole was remarkably round, and had a strong smell. The tendrils that issue from each end of the purse of this fish are much more delicate and slender than those of any other; are as fine as Indian grass, and very much resemble it. The female of this species, and we believe of other sharks, is greatly superior in size to the male; so that in this respect there is an agreement between the fish and the birds of prey. They bring about 19 young at a time: the fishermen believe

Squamaria believe that they breed at all times of the year, as they scarce ever take any but what are with young.

Stabbing.

8. The catulus, or lesser spotted shark.—The weight of one that was brought to Mr Pennant by a fisherman was only one pound twelve ounces; the length two feet two inches: it is of a slender make in all parts. The head was flat; the nostrils covered with a long flap; the nose blunt, and marked beneath with numerous small punctures; behind each eye was a small orifice; the back-fins, like those of the former, placed far behind. The ventral fins are united, forming as if it were but one, which is a sure mark of this species. The tail finned like that of the greater dog-fish. The colour is cinereous, streaked in some parts with red, and generally marked with numbers of small black spots; but in some they are very faint and obscure. The belly is white. This species breeds from 9 to 13 young at a time; is very numerous on some of our coasts, and very injurious to the fisheries.

SQUAMARIA, in botany. See **LATHRÆA**.

SQUAMOUS, in anatomy, a name given to the spurious or false sutures of the skull, because composed of squame, or scales like those of fishes.

SQUARE, in geometry, a quadrilateral figure both equilateral and equiangular. See **GEOMETRY**.

SQUARE-Root. See **ALGEBRA**, n° 8. and **ARITHMETIC**, n° 33.

Hollow SQUARE, in the military art, a body of foot drawn up with an empty space in the middle, for the colours, drums, and baggage, faced and covered by the pikes every way, to keep off the horse.

SQUARE, among mechanics, an instrument consisting of two rules or branches, fastened perpendicularly at one end of their extremities, so as to form a right angle. It is of great use in the description and mensuration of right angles, and laying down perpendicularly.

SQUARE-Rigged, an epithet applied to a ship whose yards are very long. It is also used in contradistinction to all vessels whose sails are extended by flays or lateen-yards, or by booms and gaffs; the usual situation of which is nearly in the plane of the keel; and hence,

SQUARE-Sail, is a sail extended to a yard which hangs parallel to the horizon, as distinguished from the other sails which are extended by booms and flays placed obliquely. This sail is only used in fair winds, or to scud under in a tempest. In the former case, it is furnished with a large additional part called the *bonnet*, which is then attached to its bottom, and removed when it is necessary to scud. See that article.

SQUATINA. See **SQUALUS**.

SQUILL, in botany. See **SCILLA**.

SQUILLA, the name of a species of cancer. See **CANCER**, n° 5, 6.

SQUINTING. See **MEDICINE**, n° 476.

SQUIRREL, in zoology. See **SCIURUS**.

STABBING, in law. The offence of mortally stabbing another, though done upon sudden provocation, is punished as murder; the benefit of clergy being taken away from it by statute. (See **MURDER**). For by J. I. c. 8. when one thrusts or stabs another, not then having a weapon drawn, or who hath not then first stricken the party stabbing, so that he dies thereof within six months after, the offender shall not

have the benefit of clergy, though he did it not of malice aforethought. This statute was made on account of the frequent quarrels and stabblings with short daggers between the Scotch and the English at the accession of James I.; and being therefore of a temporary nature, ought to have expired with the mischief which it meant to remedy. For, in point of solid and substantial justice, it cannot be said that the mode of killing, whether by stabbing, strangling, or shooting, can either extenuate or enhance the guilt; unless where, as in the case of poisoning, it carries with it an internal evidence of cool and deliberate malice. But the benignity of the law hath construed the statute so favourably in behalf of the subject, and so strictly when against him, that the offence of stabbing now stands almost upon the same footing as it did at the common law. Thus, (not to repeat the cases mentioned under **MANSLAUGHTER**, of stabbing an adulteress, &c. which are barely manslaughter, as at common law), in the construction of this statute it hath been doubted, whether, if the deceased had struck at all before the mortal blow given, this does not take it out of the statute, though in the preceding quarrel the stabber had given the first blow; and it seems to be the better opinion, that this is not within the statute. Also it hath been resolved, that the killing a man, by throwing a hammer or other weapon, is not within the statute; and whether a shot with a pistol be so or not, is doubted. But if the party slain had a cudgel in his hand, or had thrown a pot or a bottle, or discharged a pistol at the party stabbing, this is a sufficient reason for having a weapon drawn on his side within the words of the statute.

STADIUM, an ancient Greek long measure, containing 125 geometrical paces, or 625 Roman feet, corresponding to our furlong.

The word is formed from the Greek *στασις*, station; and it is said, on this occasion, that Hercules, after running so far at one breath, stood still. The Greeks measured all their distances by stadia, which they call *στάδιον*.—Stadium was also the course or career wherein the Greeks ran their races.

STADTHOLDER, the principal magistrate or governor of the United provinces. The Stadtholder seems to be empowered, either directly, or by his influence, to change both the deputies, magistrates, and officers in every province and city. He is president in the states of every province, though he has not so much as a state or vote in the states-general; but as he influences the states of each province to send what deputies he pleases to the assembly, he has in fact the appointing of the persons that constitute it, and may be deemed sovereign of the United Provinces. The stadtholders had once a very great power; so that we find one of them appointing what towns should send deputies to the assembly of the states of Holland: but the stadtholdership was never hereditary till the year 1747, when it was made so in the family of Orange.

It is observed, that the States passed by the stadtholder's eldest son, and appointed his younger son prince Maurice of Orange their stadtholder. At other times they have suppressed the stadtholdership entirely. The stadtholder always in the council, where there happens to be an equality of votes, has a decisive voice.

STAFF, an instrument ordinarily used to rest on in walking.

Stadium,
||
Staff.

Staff,
Staffs.

walking. The staff is also frequently used as a kind of natural weapon both of offence and defence; and for several other purposes.

STAFF, a light pole erected in different parts of a ship, whercon to hoist and display the colours.

The principal of these is reared immediately over the stern, to display the ensign; another is fixed on the bowsprit, to extend the jack; three more are erected at the three mast-heads, or formed by their upper ends, to show the flag or pendant of the respective Squadron or division to which the ship is appropriated. See ENSIGN, MAST, JACK, and PENDANT.

STAFF, in military matters, consists of a quarter-master-general, adjutant-general, and majors of brigade. The staff properly exists only in time of war. See QUARTER-Master General, &c.

Regimental STAFF, consists in the adjutant, quarter-master, chaplain, surgeon, &c.

STAFF, in music, five lines, on which, with the intermediate spaces, the notes of a song or piece of music are marked.

STAFFA, one of the Hebrides, or Western Islands of Scotland, remarkable for its basaltic pillars. It was lately visited by Mr Joseph Banks, who communicated the following account of it to Mr Pennant.

"The little island of Staffa lies on the west coast of Mull, about three leagues N. E. from Jona, or the Colum Kill: its greatest length is about an English mile, and its breadth about half a one. On the west side of the island is a small bay where boats generally land; a little to the southward of which, the first appearance of pillars was to be observed: they are small; and instead of being placed upright, lie down on their sides, each forming a segment of a circle. From thence you pass a small cave, above which the pillars, now grown a little larger, are inclining in all directions: in one place in particular, a small mass of them very much resemble the ribs of a ship. From hence having passed the cave, which, if it is not low water, you must do in a boat, you come to the first ranges of pillars, which are still not above half as large as those a little beyond. Over-against this place is a small island, called in Erse *Boo-sha-la*, separated from the main by a channel not many fathoms wide. This whole island is composed of pillars without any stratum above them; they are still small, but by much the neatest formed of any about the place.

"The first division of the island, for at high water it is divided into two, makes a kind of a cone, the pillars converging together towards the centre: on the other they are in general laid down flat; and in the front next to the main, you see how beautifully they are packed together, their ends coming out square with the bank which they form. All these have their transverse sections exact, and their surfaces smooth; which is by no means the case with the large ones, which are cracked in all directions. I much question, however, if any one of this whole island of *Boo-sha-la* is two feet in diameter.

"The main island opposite to *Boo-sha-la*, and farther towards the N. W. is supported by ranges of pillars pretty erect, and, though not tall, (as they are not uncovered to the base), of large diameters; and at their feet is an irregular pavement, made by the upper sides of such as have been broken off, which extends as

Staffs.

far under water as the eye can reach. Here the forms of the pillars are apparent: these are of three, four, five, six, and seven sides; but the number of five and six are by much the most prevalent. The largest I measured was of seven; it was four feet five inches in diameter.

"The surfaces of these large pillars, in general, are rough and uneven, full of cracks in all directions; the transverse figures in the upright ones never fail to run in their true directions. The surfaces upon which we walked were often flat, having neither concavity nor convexity; the larger number, however, were concave, though some were very evidently convex. In some places, the interstices within the perpendicular figures were filled up with a yellow spar; in one place, a vein passed in among the mass of pillars, carrying here and there small threads of spar. Though they were broken and cracked through and through in all directions, yet their perpendicular figures might easily be traced: from whence it is easy to infer, that whatever the accident might have been that caused the dislocation, it happened after the formation of the pillars.

"From hence proceeding along shore, you arrive at Fingal's cave. Its dimensions I have given in the form of a table:

| | Fect. In. |
|-------------------------------------------|-----------|
| Length of the cave from the rock without, | 371 6 |
| From the pitch of the arch, | 250 0 |
| Breadth of ditto at the mouth, | 53 7 |
| At the farther end, | 20 0 |
| Height of the arch at the mouth, | 117 6 |
| At the end, | 70 0 |
| Height of an outside pillar, | 39 6 |
| Of one at the N. W. corner, | 54 0 |
| Depth of water at the mouth, | 18 0 |
| At the bottom, | 9 0 |

"The cave runs into the rock in the direction of N. E. by E. by the compass.

"Proceeding farther to the north-west, you meet with the highest ranges of pillars; the magnificent appearance of which is past all description. Here they are bare to their very basis, and the stratum below them is also visible: in a short time, it rises many feet above the water, and gives an opportunity of examining its quality. Its surface is rough, and has often large lumps of stone sticking in it as if half immerged: itself, when broken, is composed of a thousand heterogeneous parts, which together have very much the appearance of a lava; and the more so, as many of the lumps appear to be of the very same stone of which the pillars are formed. This whole stratum lies in an inclined position, dipping gradually towards the south-east. As hereabouts is the situation of the highest pillars, I shall mention my measurements of them and the different strata in this place, premising, that the measurements were made with a line, held in the hand of a person who stood at the top of the cliff, and reaching to the bottom; to the lower end of which was tied a white mark, which was observed by one who stood below for the purpose: when this mark was set off from the water, the person below noted it down, and made signal to him above, who made then a mark in his rope: whenever this mark passed a notable place, the same signal was made, and the name of the place noted

ted down as before: the line being all hauled up, and the distances between the marks measured and noted down, gave, when compared with the book kept below, the distances, as for instance in the cave:

"No 1. in the book below, was called from the water to the foot of the first pillar in the book above; n^o 1. gave 36 feet 8 inches, the height of that ascent, which was composed of broken pillars.

"No 1. Pillar at the west corner of Fingal's cave.

| | Fect. In. |
|---------------------------------------------|-----------|
| 1 From the water to the foot of the pillar, | 12 10 |
| 2 Height of the pillar, | 37 3 |
| 3 Stratum above the pillar, | 66 9 |

"No 2. Fingal's cave.

| | |
|------------------------------------------------------|------|
| 1 From the water to the foot of the pillar, | 36 8 |
| 2 Height of the pillar, | 39 6 |
| 3 From the top of the pillar to the top of the arch, | 31 4 |

| | |
|------------------------------------------------------------------------------------------------|-------|
| 4 Thickness of the stratum above, | 34 4 |
| By adding together the three first measurements, we got the height of the arch from the water, | 117 6 |

"No 3. Corner pillar to the westward of Fingal's cave.

| | |
|-----------------------------------------------|------|
| Stratum below the pillar of lava-like matter, | 11 0 |
| Length of pillar, | 54 0 |
| Stratum above the pillar, | 61 6 |

"No 4. Another pillar to the westward.

| | |
|---------------------------|------|
| Stratum below the pillar, | 17 1 |
| Height of the pillar, | 50 0 |
| Stratum above, | 51 1 |

"No 5. Another pillar farther to the westward.

| | |
|---------------------------|------|
| Stratum below the pillar, | 19 8 |
| Height of the pillar, | 55 1 |
| Stratum above, | 54 7 |

"The stratum above the pillars, which is here mentioned, is uniformly the same, consisting of numberless small pillars, bending and inclining in all directions, sometimes so irregularly that the stones can only be said to have an inclination to assume a columnar form; in others more regular, but never breaking into or disturbing the stratum of large pillars, whose tops every where keep an uniform and regular line.

"Proceeding now along the shore round the north end of the island, you arrive at *Oua na scarve*, or the Corvoraunt's Cave. Here the stratum under the pillars is lifted up very high; the pillars above it are considerably less than those at the north-west end of the island, but still very considerable. Beyond is a bay, which cuts deep into the island, rendering it in that place not more than a quarter of a mile over. On the sides of this bay, especially beyond a little valley, which almost cuts the island into two, are two stages of pillars, but small; however, having a stratum between them exactly the same as that above them, formed of innumerable little pillars, shaken out of their places, and leaning in all directions.

"Having passed this bay, the pillars totally cease; the rock is of a dark-brown stone, and no signs of regularity occur till you have passed round the south-east end of the island (a space almost as large as that occupied by the pillars), which you meet again on the west side, beginning to form themselves irregularly, as if the stratum had an inclination to that form, and soon arrive at the bending pillars where I began.

"The stone of which the pillars are formed, is a coarse kind of basalt, very much resembling the Giant's Caulfway in Ireland, though none of them are near so neat as the specimens of the latter which I have seen at the British Museum; owing chiefly to the colour, which in ours is a dirty brown, in the Irish a fine black: indeed the whole production seems very much to resemble the Giant's Caulfway."

STAFFORD, the capital of a county of England of the same name, in W. Long. 2. 6. N. Lat. 52. 20. It stands on the river Sow, over which it has a stone-bridge. It is well built and paved, and had formerly a cattle and walls. It has a flourishing cloth-manufacture, and gives the title of *earl* to a Popish branch of the family of Howard.

STAFFORDSHIRE, a county of England, bounded on the south by Worcestershire, by Cheshire and Derbyshire on the north, by Warwickshire and Derbyshire on the east, and Shropshire and Cheshire on the west. The length is reckoned at 40 miles, the breadth at 26, and the circumference at 141. It contains 5 hundreds, 150 parishes, 810,000 acres, 1 city, and 18 market-towns. The air, except in those parts that are called the Moorlands and Woodlands, and about the mines, is good, especially upon the hills, where it is accounted very fine: but the soil in the northern mountainous part is not so fertile. In the middle, where it is watered by the Trent, the third river in England, it is both fruitful and pleasant, being a mixture of arable and meadow grounds. In the south, it abounds not only with corn, but with mines of iron and pits of coal. The other rivers of this country, besides the Trent, which runs almost through the middle of it, and abounds with salmon, are the Dove and Tame, both which are well stored with fish. In this county are also a great many lakes, or meres and pools, as they are called; which, having streams either running into them or from them, cannot be supposed to be of any great prejudice to the air, and yield plenty of fish. In divers parts of the county are medicinal waters, impregnated with different sorts of minerals, and consequently of different qualities and virtues; as those at Hynts and Brefsford-house, which are mixed with bitumen; those at Ingeltre, Codfallow, and Willough-bridge park, which are sulphureous. Of the saline kind are the Brine-pits at Chertley, Epson, Penfnet-clofe, of which very good salt is made. There is a well at Newcastle Under-Line that is said to cure the king's evil; another called *Elder-well* near Blehill, said to be good for sore eyes; and a third called the *Spa*, near Wolverhampton.

Great flocks of sheep are bred in this county, especially in the moor-lands, or mountains of the northern part of it; but the wool is said to be somewhat coarser than that of many other counties. Of this wool, however, they make a variety of manufactures, particularly felts. In the low grounds along the rivers, are rich pastures for black cattle; and vast quantities of butter and cheese are made there. In the middle and southern parts not only grain of all kinds, but a great deal of hemp and flax, are raised. This county produces also lead, copper, iron; marble, alabaster, mill-stones, limestone; coal, salt, and marles of several sorts and colours; brick-earth, fullers-earth, and potters-clay, particularly a sort used in the glass-manufacture at Amble-

Stag
||
Stamina.

Amblecot, and fold at seven-pence a bushel; tobacco-pipe-clay; a sort of reddish earth called *slip*, used in painting divers vessels; red and yellow okers; fire-stones for hearths of iron furnaces, ovens, &c.; iron-stones of several sorts; blood-stones, or hæmatites, found in the brook Tent, which, when wet a little, will draw red lines like ruddle; quarry-stones, and grind-stones. For fuel the county is well supplied with turf, peat, and coal of several sorts, as cannel-coal, peacock-coal, and pit-coal. The peacock-coal is so called, because, when turned to the light, it displays all the colours of the peacock's tail; but it is fitter for the forge than the kitchen. Of the pit-coal there is an inexhaustible store: its burns into white ashes, and leaves no such cinder as that of the Newcastle coal. It is not used for malting till it is charred, and in that state it makes admirable winter-fuel for a chamber.

This county is in the diocese of Litchfield and Coventry, and the Oxford circuit. It sends eight members to parliament; namely, two for the county, two for the city of Litchfield, two for Stafford, and two for Newcastle-Under-Line.

STAG, in zoology. See CERVUS.

STAGE, in the modern drama, the place of action and representation, included between the pit and the scenes, and answering to the proscenium or pulpitum of the ancients.

STAGGERS. See FARRIERY, § ix.

STAHL (George Ernest), an eminent German chemist, born in Franconia in the year 1660. He wrote upon almost all parts of chemistry; and his works, some of which are in German, and some in Latin, are highly esteemed.

STAINING of BONE, IVORY, MARBLE, PAPER, WOOD, &c. See these articles.

STAIRCASE, in architecture, an ascent inclosed between walls, or a ballustrade consisting of stairs or steps, with landing places and rails, serving to make a communication between the several stories of a house. See ARCHITECTURE, n° 94, &c.

STALACTITE, in natural history, crystalline spars formed into oblong, conical, round, or irregular bodies, composed of various crusts, and usually found hanging in form of icicles from the roofs of grottos, &c.

STALE, among sportsmen, a living fowl put in a place to allure and bring others where they may be taken. For want of these, a bird shot, his entrails taken out, and dried in an oven in his feathers, with a stick thrust through to keep it in a convenient posture, may serve as well as a live one.

STALE is also a name for the urine of catile.

STALLION, or STONE-HORSE, in the manege, an ungelt horse, designed for the covering of mares, in order to propagate the species. See EQUUS.

STAMFORD, an ancient town of Lincolnshire in England; seated on the river Walland, on the edge of Northamptonshire. It is a large handsome place, containing six parish-churches, several good streets, and fine buildings. It had formerly a college, the students of which removed to Brazen-Nose college in Oxford. It has no considerable manufactories, but deals chiefly in malt. W. Long. c. 27. N. Lat. 52. 39.

STAMINA, in botany, are those upright filaments which, on opening a flower, we find within the co-

rolla surrounding the pistillum. According to Linnaeus, they are the male organs of generation, whose office it is to prepare the pollen. Each flamen consists of two distinct parts, viz. the FILAMENTUM and the ANTHERA.

STAMINA, in the animal body, are defined to be those simple original parts which existed first in the embryo, or even in the seed; and by whose distinction, augmentation, and accretion, by additional juices, the animal body, at its utmost bulk, is supposed to be formed.

STAMP-DUTIES, a branch of the perpetual revenue. See REVENUE.

There is a tax imposed upon all parchment and paper whereon any legal proceedings, or private instruments of almost any nature whatsoever, are written; and also upon licences for retailing wines, of all denominations; upon all almanacks, newspapers, advertisements, cards, dice, &c. These imposts are very various, according to the nature of the things stamped, rising gradually from a penny to ten pounds. This is also a tax which, though in some instances it may be heavily felt, by greatly increasing the expence of all mercantile as well as legal proceedings, yet (if moderately imposed) is of service to the public in general, by authenticating instruments, and rendering it much more difficult than formerly to forge deeds of any kind; since, as the officers of this branch of the revenue vary their stamps frequently, by marks perceptible to none but themselves, a man that would forge a deed of king William's time, must know and be able to counterfeit the stamp of that date also. In France and some other countries the duty is laid on the contract itself, not on the instrument in which it is contained; as, with us too in England, (besides the stamps on the indentures), a tax is laid, by statute 8 Ann. c. 9. on every apprentice-fee; of 6d. in the pound if it be 50l. or under, and 1s. in the pound if a greater sum: but this tends to draw the subject into a thousand nice disquisitions and disputes concerning the nature of his contract, and whether taxable or not; in which the farmers of the revenue are sure to have the advantage. Our general method answers the purposes of the state as well, and consults the ease of the subject much better. The first institution of the stamp-duties was by statute 5 and 6 W. and M. c. 21. and they have since, in many instances, been increased to five times their original amount.

STANCHION, or STANCHIONS, a sort of small pillars of wood or iron used for various purposes in a ship; as to support the decks, the quarter-rails, the nettings, the awnings, &c. The first of these are two ranges of small columns fixed under the beams, throughout the ship's length between decks; one range being on the starboard and the other on the larboard side of the hatchways. They are chiefly intended to support the weight of the artillery.

STAND, in commerce, a weight from two hundred and an half to three hundred of pitch.

STANDARD, in war, a sort of banner or flag, borne as a signal for the joining together of the several troops belonging to the same body.

STANDARD, in commerce, the original of a weight, measure, or coin, committed to the keeping of a magistrate, or deposited in some public place, to regulate,

Stamina
||
Standard.

Stanhope. adjust, and try the weights used by particular persons in traffic. See MONEY.

STANHOPE (Philip Dormer, earl of Chesterfield), was born in 1695, and educated in Trinity-hall, Cambridge; which place he left in 1714, when, by his own account, he was an absolute pedant. In this character he went abroad, where a familiarity with good company soon convinced him he was totally mistaken in almost all his notions: and an attentive study of the air, manner, and address of people of fashion, soon polished a man whose predominant desire was to please; and who, as it afterward appeared, valued exterior accomplishments beyond any other human acquirement. While lord Stanhope, he got an early feat in parliament; and in 1722, succeeded to his father's estate and titles. In 1728, and in 1745, he was appointed ambassador extraordinary and plenipotentiary to Holland, which high character he supported with the greatest dignity; serving his own country, and gaining the esteem of the states-general. Upon his return from Holland, he was sent lord-lieutenant of Ireland; and during his administration there, gave general satisfaction to all parties. He left Dublin in 1746, and in October succeeded the earl of Harrington as secretary of state, in which post he officiated until Feb. 6th 1748. Being seized with a deafness in 1752 that incapacitated him for the pleasures of society, he from that time led a private and retired life, amusing himself with books and his pen; in particular, he engaged largely as a volunteer in a periodical miscellaneous paper called *The World*, in which his contributions have a distinguished degree of excellence. He died in 1773, leaving a character for wit and abilities that had few equals. He distinguished himself by his eloquence in parliament on many important occasions; of which we have a characteristic instance, of his own relating. He was an active promoter of the bill for altering the style; on which occasion, as he himself writes in one of his letters to his son, he made so eloquent a speech in the house, that every one was pleased, and said he had made the whole very clear to them; "when (says he), God knows, I had not even attempted it. "I could just as soon have talked Celtic or Slavonian to them, as astronomy; and they would have understood me full as well." Lord Macclesfield, one of the greatest mathematicians in Europe, and who had a principal hand in framing the bill, spoke afterward, with all the clearness that thorough knowledge of the subject could dictate; but not having a flow of words equal to lord Chesterfield, the latter gained the applause from the former, to the equal credit of the speaker and the auditors. The high character lord Chesterfield supported during life, received no small injury soon after his death, from a fuller display of it by his own hand. He left no issue by his lady, but had a natural son, Philip Stanhope, Esq; whose education was for many years a close object of his attention, and who was afterward envoy extraordinary at the court of Dresden, but died before him. When lord Chesterfield died, Mr Stanhope's widow published a course of letters, written by the father to the son, filled with instructions suitable to the different gradations of the young man's life to whom they were addressed. These letters contain many fine observations on mankind, and rules of conduct: but it is observable

that he lays a greater stress on exterior accomplishments and address, than on intellectual qualifications and sincerity; and allows greater latitude to fashionable pleasures than good morals will justify, especially in paternal instructions. Hence it is that a celebrated writer†, of manners somewhat different from those of the polite earl of Chesterfield, is said to have observed† of these Letters, that "they inculcate only the morals of a whore, with the manners of a dancing-maſter."

STANISLAUS I. king of Poland and elector of Saxony, a most unfortunate but virtuous prince. He was driven from his dominions by his competitor, who was supported by the czar Peter the Great, in opposition to Charles XII. king of Sweden. He was obliged, by a treaty of peace in 1736, to content himself with the empty title of *king*, and the duchies of Lorraine and Bar, in which he led a retired life; distinguishing himself, however, in this obscure situation, by public and private acts of humanity and benevolence; particularly by supplying a fund, under the direction of the magistrates of Bar, for purchasing corn, to be sold at a cheap price to the poor, whenever it becomes dear. At the age of 90 he came to a fatal end, having set fire to his night-gown in smoking his pipe: he was burnt almost to death before he could get assistance; and died soon after, in 1766. He wrote several philosophical, political, and moral tracts, which were published under the title of *The Works of the Beneficent Philosopher*, in 4 vols 8vo. Paris, 1673.

STANLEY (Thomas), a very learned English writer in the 17th century, was the son of Sir Thomas Stanley of Cumberlow-Green in Herefordshire, knight. He was born at Cumberlow, and educated in his father's house, whence he removed to the university of Cambridge. He afterwards travelled; and, upon his return to England, prosecuted his studies in the Middle Temple. He married, when young, Dorothy, the eldest daughter of Sir John Enyon of Flowne, in Northamptonshire, baronet. He wrote, 1. A volume of Poems. 2. History of Philosophy, and Lives of the Philosophers. 3. A Translation of and Commentary on Eschylus; and several other works. He died in 1678.

STANNARIES, the mines and works where tin is dug and purified; as in Cornwall, Devonshire, &c.

STANNARY courts, in Devonshire and Cornwall, for the administration of justice among the tinners therein. They are held before the lord-warden and his substitutes, in virtue of a privilege granted to the workers in the tin-mines there, to sue and be sued only in their own courts, that they may not be drawn from their business, which is highly profitable to the public, by attending their law-suits in other courts. The privileges of the tinners are confirmed by a charter, 33 Edw. I. and fully expounded by a private statute, 50 Edw. III. which has since been explained by a public act, 16 Car. I. c. 15. What relates to our present purpose is only this: That all tinners and labourers in and about the stannaries shall, during the time of their working therein, *bona fide*, be privileged from suits of other courts, and be only pleaded in the stannary court in all matters, excepting pleas of land, life, and member. No writ of error lies from hence to any court in Westminster-hall; as was agreed by all the judges, in 4 Jac. I. But an appeal lies from the steward

Stanislaus

Stannary.

Dr John-

Stannum
||
Star.

steward of the court to the under warden; and from him to the lord-warden; and thence to the privy-council of the prince of Wales, as duke of Cornwall, when he hath had livery or investiture of the same. And from thence the appeal lies to the king himself, in the last resort.

STANNUM, TIN. See CHEMISTRY, n° 150, 203, 246, 285, 406.

STANZA, in poetry, a certain stated number of verses, generally containing a perfect sense, that ought to end with some lively and ingenious thought, or just and pertinent reflection.

- STAPLE, primarily signifies a public place or market, whither merchants, &c. are obliged to bring their goods to be bought by the people; as the Greve, or the places along the Seine, for sale of wines and corn, at Paris, whither the merchants of other parts are obliged to bring those commodities.

Formerly, the merchants of England were obliged to carry their wool, cloth, lead, and other like staple commodities of this realm, in order to utter the same by wholesale; and these staples were appointed to be constantly kept at York, Lincoln, Newcastle upon Tyne, Norwich, Westminster, Canterbury, Chichester, Winchester, Exeter, and Bristol; in each whereof a public mart was appointed to be kept, and each of them had a court of the mayor of the staple, for deciding differences, held according to the law-merchant, in a summary way.

STAR, in astronomy, a general name for all the heavenly bodies, which, like so many brilliant studs, are dispersed throughout the whole heavens.

The stars are distinguished, from the phenomena of their motion, &c. into fixed, and erratic or wandering stars: these last are again distinguished into the greater luminaries, viz. the sun and moon; the planets, or wandering stars, properly so called; and the comets; which have been all fully considered and explained under the article ASTRONOMY.

As to the fixed stars, or simply stars, they are so called, because they seem to be fixed, or perfectly at rest, and consequently appear always at the same distance from each other.

Falling STARS, in meteorology, fiery meteors which dart through the sky in form of a star. See ELECTRICITY, n° 39. and METEOR.

Twinkling of the STARS. See OPTICS, n° 20. et seq.

STAR, is also a badge of honour, worn by the knights of the garter, bath, thistle. See GARTER.

STAR of Bethlehem, in botany. See ORNITHOGALUM.

Court of STAR-CHAMBER, (*camera stellata*), a famous, or rather infamous, English tribunal, said to have been so called either from a Saxon word signifying to steer or govern; or from its punishing the *crimen stellionatus*, or cozenage; or because the room wherein it sat, the old council-chamber of the palace of Westminster, (Lamb. 148.) which is now converted into the lottery-office, and forms the eastern side of new palace-yard, was full of windows; or, (to which Sir Edward Coke, 4. Inst. 66. accedes), because *haphly* the roof thereof was at the first garnished with gilded stars. As all these are merely conjectures, (for no stars are now in the roof, nor are any said to have remained there fo

Star.

late as the reign of queen Elizabeth), it may be allowable to propose another conjectural etymology, as plausible perhaps as any of them. It is well known, that, before the banishment of the Jews under Edward I. their contracts and obligations were denominated in our ancient records *starra* or *starris*, from a corruption of the Hebrew word, *stetar*, a covenant. (*Tovey's Angl. Judaic.* 32. Selden. tit. of hon. ii. 34. *Uxor Ebraic.* i. 14.) These stars, by an ordinance of Richard the first, preserved by Hoveden, were commanded to be enrolled and deposited in chests under three keys in certain places; one, and the most considerable, of which was in the king's exchequer at Westminster: and no star was allowed to be valid, unless it were found in some of the said repositories. (*Memorand.* in *Scac' P. 6 Eduw. I.* prefixed to Maynard's year-book of Edw. II. fol. 8. Madox hist. exch. c. vii. § 4, 5, 6.) The room at the exchequer, where the chests containing these stars were kept, was probably called the *star-chamber*; and, when the Jews were expelled the kingdom, was applied to the use of the king's council, sitting in their judicial capacity. To confirm this, the first time the star chamber is mentioned in any record, it is said to have been situated near the receipt of the exchequer at Westminster: (the king's council, his chancellor, treasurer, justices, and other judges, were assembled *en la chambre des esteilles pres la receipt al Westminster.* Clauf. 41. *Eduw. III. m. 13.*) For in process of time, when the meaning of the Jewish *stars* were forgotten, the word *star-chamber* was naturally rendered in law-French, *la chambre des esteilles*, and in law-Latin *camera stellata*; which continued to be the style in Latin till the dissolution of that court.

This was a court of very ancient origin; but new-modelled by statutes 3 Hen. VII. c. 1. and 21 Hen. VIII. c. 20, consisting of divers lords spiritual and temporal, being privy counsellors, together with two judges of the courts of common-law, without the intervention of any jury. Their jurisdiction extended legally over riots, perjury, misbehaviour of sheriffs and other notorious misdemeanors, contrary to the laws of the land. Yet this was afterwards (as lord Clarendon informs us) stretched "to the asserting of all proclamations and orders of state; to the vindicating of illegal commissions, and grants of monopolies; holding for honourable that which pleased, and for just that which profited; and becoming both a court of law to determine civil rights, and a court of revenue to enrich the treasury: the council-table by proclamations enjoining to the people that which was not enjoined by the laws, and prohibiting that which was not prohibited; and the star-chamber, which consisted of the same persons in different rooms, censuring the breach and disobedience to those proclamations by very great fines, imprisonments, and corporal severities: so that any disrespect to any acts of state, or to the persons of statemen, was in no time more penal, and the foundations of right never more in danger to be destroyed." For which reasons, it was finally abolished by statute 16 Car. I. c. 10. to the general joy of the whole nation. See KING'S Bench. There is in the British Museum (Harl. MSS. Vol. I. n° 12.6.) a very full, methodical, and accurate account of the constitution and course of this court, compiled by,

Star,
Starch.

by William Hudfon of Gray's Inn, an eminent practitioner therein; a short account of the fame, with copies of all its processs, may also be found in 18 Rym. Foed. 192, &c.

STAR-Board, the right side of the ship when the eye of the spectator is directed forward.

STAR-Fish. See **ASTERIAS**.

STAR Shot, a gelatinous substance frequently found in fields, and supposed by the vulgar to have been produced from the meteor called a *falling-star*: but, in reality, is the half-digested food of herons, sea-mews, and the like birds; for these birds, when shot, have been found, when dying, to disgorge a substance of the same kind.

STAR-Stone, in natural history, a name given to certain extraneous fossil stones, in form of short, and commonly somewhat crooked, columns, composed of several joints, each resembling the figure of a radiated star, with a greater or smaller number of rays in the different species: they are usually found of about an inch in length, and of the thickness of a goose-quill. Some of them have five angles or rays, and others only four; and in some the angles are equi-distant, while in others they are irregularly so: in some also they are short and blunt, while in others they are long, narrow, and pointed; and some have their angles very short and obtuse. The several joints in the same specimen are usually all of the same thickness; this, however, is not always the case; but in some they are larger at one end, and in others at the middle, than in any other part of the body; and some species have one of the rays bifid, so as to emulate the appearance of a fix-rayed kind.

STARCH, a fecula or sediment, found at the bottom of vessels wherein wheat has been steeped in water, of which fecula, after separating the bran from it, by passing it through sieves, they form a kind of loaves, which being dried in the sun or an oven, is afterwards cut into little pieces, and so sold. The best starch is white, soft, and friable, and easily broken into powder. Such as require fine starch, do do not content themselves, like the starchmen, with refuse wheat, but use the finest grain. The process is as follows: The grain being well cleaned, is put to ferment in vessels full of water, which they expose to the sun while in its greatest heat; changing the water twice a-day, for the space of eight or twelve days, according to the season. When the grain bursts easily under the finger, they judge it sufficiently fermented. The fermentation perfected, and the grain thus softened, it is put, handful by handful, into a canvas-bag, to separate the flour from the husks; which is done by rubbing and beating it on a plank laid across the mouth of an empty vessel that is to receive the flour.

As the vessels are filled with this liquid flour, there is seen swimming at top a reddish water, which is to be carefully skimmed off from time to time, and clean water is to be put in its place, which, after stirring the whole together, is also to be strained through a cloth or sieve, and what is left behind put into the vessel with new water, and exposed to the sun for some time. As the sediment thickens at the bottom, they drain off the water four or five times, by inclining the vessel, but without passing it through the sieve. What remains at bottom is the starch, which

they cut in pieces to get out, and leave it to dry in the sun. When dry, it is laid up for use.

STARE, or **STARLING**. See **STURNUS**.

STATE of a **CONTOVERSY**. See **ORATORY**, n^o 20, &c.

STATES, or **ESTATES**, a term applied to several orders or classes of people assembled to consult of matters for the public good.

Thus *states-general* is the name of an assembly consisting of the deputies of the seven United Provinces. There are usually 30 in number, some provinces sending two, others more; and whatever resolution the *states-general* take, must be confirmed by every province, and by every city and republic in that province, before it has the force of a law. The deputies of each province, of what number soever they be, have only one voice, and are esteemed as but one person, the votes being given by provinces. Each province presides in the assembly in its turn, according to the order settled among them. *Guelderland* presides first, then *Holland*, &c.

States of Holland are the deputies of eighteen cities, and one representative of the nobility, constituting the *states* of the province of *Holland*: the other provinces have likewise their *states*, representing their sovereignty; deputies from which make what they call the *states-general*. In an assembly of the *states* of a particular province, one dissenting voice prevents their coming to any resolution.

STATIUS, (*Publius Papinius*), a celebrated Latin poet of the first century, was born at Naples, and was the son of *Statius*, a native of *Epirus*, who went to Rome to teach poetry and eloquence, and had *Domitian* for his scholar. *Statius* the poet also obtained the favour and friendship of that prince; and dedicated to him his *Thebais* and *Achilleis*; the first in twelve books, and the last in two. He died at Naples about the year 100. Besides the above poems, there are also still extant his *Sylvæ*, in five books; the style of which is purer, more agreeable, and more natural, than that of his *Thebais* and *Achilleis*.

STATUARY, a branch of sculpture, employed in the making of statues. See **SCULPTURE** and the next article.

Statuary is one of those arts wherein the ancients surpassed the moderns; and indeed it was much more popular, and more cultivated, among the former than the latter. It is disputed between statuary and painting, which of the two is the most difficult and the most artful.

Statuary is also used for the artificer who makes statues. *Phidias* was the greatest statuary among the ancients, and *Michael Angelo* among the moderns.

STATUE, is defined to be a piece of sculpture in full relief, representing a human figure. *Daviler* more scientifically defines statue a representation, in high relief and insulate, of some person distinguished by his birth, merit, or great actions, placed as an ornament in a fine building, or exposed in a public place, to preserve the memory of his worth. In strictness, the term statue is only applied to figures on foot, the word being formed from *statuira*, the size of the body.

Statues are formed with the chisel, of several matters, as stone, marble, plaster, &c. They are also cast

Stare
Statue.

Statue. cast of various kinds of metal, particularly gold, silver, brass, and lead. For the method of casting statues, see the article **FOUNDERY of Statues**.

Statues are usually distinguished into four general kinds. The first are those less than the life; of which kind we have several statues of great men, of kings, and of gods themselves. The second are those equal to the life; in which manner it was that the ancients, at the public expence, used to make statues of persons eminent for virtue, learning, or the services they had done. The third are those that exceed the life; among which those that surpassed the life once and a half were for kings and emperors; and those double the life, for heroes. The fourth kind were those that exceeded the life twice, thrice, and even more, and were called *colossifigs*. See **COLOSSUS**.

Every statue resembling the person it is intended to represent, is called *statua iconica*. Statues acquire various other denominations. 1. Thus, allegorical statue is that which, under a human figure, or other symbol, represents something of another kind; as a part of the earth, a season, age, element, temperament, hour, &c. 2. Curule statues, are those which are represented in chariots drawn by bigæ or quadrigæ, that is, by two or four horses; of which kind there were several in the circuses, hippodromes, &c. or in cars, as we see some, with triumphal arches on antique medals. 3. Equestrian statue, that which represents some illustrious person on horseback, as that famous one of Marcus Aurelius at Rome; that of king Charles I. at Charing-cross; King George II. in Leicester-Square, &c. 4. Greek statue, denotes a figure that is naked and antique; it being in this manner the Greeks represented their deities, athletes of the olympic games, and heroes: the statues of heroes were particularly called *Achilleian statues*, by reason of the great number of figures of Achilles in most of the cities of Greece. 5. Hydraulic statue, is any figure placed as an ornament of a fountain or grotto, or that does the office of a *jet d'eau*, a cock, spout, or the like, by any of its parts, or by any attribute it holds: the like is to be understood of any animal serving for the same use. 6. Pedestrian statue, a statue standing on foot; as that of king Charles II. in the Royal-Exchange, and of king James II. in the Privy-Gardens. 7. Roman statue, is an appellation given to such as are clothed, and which receive various names from their various dresses. Those of emperors, with long gowns over their armour, were called *statue paludate*; those of captains and cavaliers, with coats of arms, *thoracate*; those of soldiers with cuirasses, *loricate*; those of senators and augurs, *trabeate*; those of magistrates with long robes, *togate*; those of the people with a plain tunic, *tunicate*; and, lastly, those of women with long trains, *stolate*.

In repairing a statue cast in a mould, they touch it up with a chisel, graver, or other instrument, to finish the places which have not come well off: they also clear off the barbs, and what is redundant in the joints and projectures.

STATUTE, in its general sense, signifies a law, ordinance, decree, &c. See **LAW**, &c.

STATUTE, in our laws and customs, more immediately signifies an act of parliament made by the three estates of the realm; and such statutes are either ge-

neral, of which the courts at Westminster must take notice without pleading them; or they are special and private, which last must be pleaded.

STAY, a large strong rope employed to support the mast on the fore-part, by extending from its upper end towards the fore-part of the ship, as the shrouds are extended to the right and left, and behind it. See **MAST**, **RIGGING**, and **SHROUD**.

The stay of the fore-mast *a*, fig. 3. Plate CCLXXXVI. which is called the *fore-stay*, reaches from the mast-head towards the bowprit-end: the main-stay *b* extends over the forecable to the ship's stem; and the mizen-stay *c* is stretched down to that part of the main-mast which lies immediately above the quarter-deck: the fore-top-mast stay *d* comes also to the end of the bowprit, a little beyond the fore-stay: the main-top-mast stay *e* is attached to the head or hounds of the fore-mast; and the mizen-top-mast stay comes also to the hounds of the main-mast: the fore-top-gallant stay comes to the outer end of the jib-boom; and the main-top-gallant stay is extended to the head of the fore-top-mast.

STAY-Sail, a sort of triangular sail extended upon a stay. See **SAIL**.

STEAM, the smoke arising from water, or any other liquid, when considerably heated.

STEAM-Engine, an engine for raising water by means of fire.

The earliest account to be met with of the invention of this engine is in a book published by the marquis of Worcester in the year 1663, where he proposed the raising of great quantities of water by the force of fire, or by turning water into steam; and mentions an engine of that kind of his own contrivance which could raise a continual stream like a fountain 40 feet high, by the means of two cocks which were alternately and successively turned by a man to admit the steam, and to re-fill the vessel with cold water, the fire being continually kept up: for which reason this nobleman is generally looked upon as the first inventor of this engine; and though his method of applying the force of steam was certainly much different from the present, yet the water was raised by the same original power, which is the expansion of water into steam by fire. However, this invention not meeting with encouragement, probably owing to the confused state in which the public affairs were about that time, it was neglected, and lay dormant several years until one captain Savery having read the marquis of Worcester's books, several years afterwards, tried many experiments upon the force and power of steam; and at last luckily hit upon a method of applying it to raise water. This he had no sooner done, than he bought up and destroyed all the marquis's books that could be got, and then claimed the honour of this invention to himself, and obtained a patent for it, pretending to have discovered this secret of nature by such an accident as by experiment was found could not give him any such idea. He contrived an engine which, after many experiments, he brought to some degree of perfection, so as to raise water in small quantities: but he could not succeed in raising water a great height and in large quantities for the draining of mines; to effect which by his method, the steam required to be boiled to such a strength as would have

Stay
||
Steam.

burst all his vessels; so that he was obliged to be content with raising water a small height or in small quantities. The largest engine that he ever erected, was for the York-buildings company in London, for the supplying the inhabitants of the Strand and that neighbourhood with water. A draught and description of one of these engines is in Harris's Lexicon Technicum.

At the same time that captain Savery was employed in perfecting his engine, Dr Papinus of Marburg was contriving one on the same principles, which he describes in a small book published in 1707, intitled *Art nova ad aquam ignis adminiculo efficacissime elevandam*. Captain Savery's engine, however, was much completer than that propoed by Dr Papinus.

About the same time also one Monsieur Amontons of Paris was engaged in the same pursuit: but his method of applying the force of steam was different from those before-mentioned; for he intended it to drive or turn a wheel, which he called a *fire-mill*, which was to work pumps for raising water: but he never brought it to perfection. Each of these three gentlemen claimed the originality of the invention; but it is more than probable they all took the hint from the book published by the marquis of Worcester many years before.

In this imperfect state it continued without farther improvements until the year 1705, when Mr Newcomen and Mr Calley of Dartmouth in Southhamptonshire made several experiments to bring it to work with a piston and beam, as now used; in which, after much pains taken, they succeeded, and obtained a patent for the sole use of this invention, for 14 years. The first proposal they made for draining of mines by this engine was in the year 1711; but they were very coldly received by many persons in the south of England, who did not understand the nature of it. In 1712, they came to an agreement with the owners of a colliery at Griff in Warwickshire, where they erected an engine with a cylinder of 22 inches diameter. At first they were under great difficulties in many things; but by the assistance of some good workmen they got all the parts put together in such a manner as to answer their intention tolerably well: and this was the first engine of the kind erected in England. There was at first one man to attend the steam-cock, and another to attend the injection-cock; but they afterwards contrived a method of opening and shutting them by some small machinery connected with the working-beam. The next engine erected by these patentees was at a colliery in the county of Durham, about the year 1718, where one Mr Beighton was concerned; who, not approving of the intricate manner of opening and shutting the cocks by strings and catches as in the former engine, substituted the hanging-beam for that purpose as at present used, and likewise made some improvement in the pipes, valves, and some other parts of the engine.

In a few years afterwards these engines came to be better understood than they had been; and their advantages, especially in draining of mines, became more apparent: and from the great number of them erected, they received additional improvements from different hands, until they arrived at their present degree of perfection.

This engine, as now improved, is the most curious and compound machine of all those inventions which have been owing to modern philosophy; and is not only applicable to the raising of large quantities of water out of mines, and for the supplying of towns, &c. but to many other of the most necessary purposes for mankind.

The principles on which it acts are truly philosophical; and when all the parts of the machine are proportioned to each other agreeable to these principles, it never fails answering the intention of the engineer.

1. It has been proved in Pneumatics, that the pressure of the atmosphere upon a square inch at the earth's surface, is about 14.8 pounds avoirdupoise at a mean. And,

2. If a vacuum is made by any means in a cylinder, Theory: which has a moveable piston suspended at one end of a lever equally divided, the air will endeavour to rush in, and will press down the piston, with a force proportionable to the area of the surface, and will raise an equal weight at the other end of the lever.

3. Water may be rarefied near 14,000 times by being reduced into steam, the particles whereof are so strongly repellent, as to drive away air of the common density, only by a heat sufficient to keep the water in a boiling state: by increasing the heat, the steam may be rendered much stronger; but this requires great strength in the vessels to support it. This steam may again be condensed into its former state by a jet of cold water dispersed among it; so that 14,000 cubic inches of steam admitted into a cylinder, may be reduced into the space of one cubic inch of water only, by which means a vacuum is partly obtained.

4. Though the pressure of the atmosphere be about 14 $\frac{8}{10}$ pounds upon every square inch, yet on account of the friction of the several parts, the resistance from some air which is unavoidably admitted with the jet of cold water, and from some remainder of steam in the cylinder, the vacuum is very imperfect, and the piston does not descend with a force exceeding eight or nine pounds upon every square inch of its surface.

5. The gallon of water of 282 cubic inches weighs 10.2 pounds avoirdupoise, or a cubic foot 62.5 pounds. The piston being pressed by the atmosphere with a force proportionable to its area in inches, multiplied by about eight or nine pounds, depresseth that end of the lever, and raiseth a column of water in the pumps of equal weight at the other end, by means of the pump-rods suspended to it. When the steam is again admitted, the piston rises and the pump-rods sink; and when that steam is condensed, the pump-rods again lift; and so alternately as long as the engine works.

It has been observed above, that the piston does not descend with a force exceeding eight or nine pounds upon every square inch of its surface; but by reason of accidental frictions and alterations in the density of the air, it will be the safest method, in calculating the power of the cylinder, to allow something less than eight pounds for the pressure of the atmosphere upon every square inch, viz. seven pounds ten ounces; and it being allowed that the gallon of water of 282 cubic inches weighs 10.2 pounds avoirdupoise, from these premises the dimensions of the cylinder, pumps, &c. for any fire-engine, may be deduced as follows:

Sup-

Suppose c = the cylinder's diameter in inches.

p = the pump's ditto.

f = the depth of the pit in fathoms.

g = the gallons drawn by a stroke of six feet or one fathom.

h = the hogheads drawn per hour.

s = the number of strokes per minute.

Then $c^2 \times .7854$ = area of the cylinder, which multiplied by 7.64 pound, the air's pressure on a square inch, we have $6c^2$ for the power of any cylinder in pounds average.

And, $p^2 \times .7854 \times 72$ =, the gallons contained in one fathom of any pump = $.2005p^2$; which multiplied by f fathoms, we have $.2005p^2f$ for the gallons contained in any number of fathoms of any pump.

Also, $.2005p^2f \times 10.2$ pound, the weight of one gallon, we have $2.0451p^2f$ = the weight in pounds of the column of water which is to be raised by the power of the cylinder.

But as a sufficient allowance was made in the power of the cylinder, by estimating it at 7.64 pound only, instead of 8 pound, the fraction of .0451 in the weight of the column of water may be safely omitted; whence we shall have $6c^2 = 2p^2f$ by the latter equation; and by the same mode $.2p^2 = \frac{p^2}{5} = g$ by the former.

Or if, instead of six pounds for the pressure of the air on each circular inch of the cylinder, it be supposed a pound, we shall then have $ac^2 = 2p^2f$; and substituting $5g$ in the place of p^2 , it will be, $ac^2 = 10gf$. And farther, $\frac{63b}{60s} = g$; whence $\frac{1.05b}{s} = \frac{p^2}{5}$.

From a comparison of these equations, the following theorems are derived, which will determine the size of the cylinder and pumps of any steam-engine capable of drawing a certain quantity of water from any assigned depth, with the pressure of the atmosphere on each circular inch of the cylinder's area.

A TABLE OF THEOREMS for the reader computing of the Powers of a Fire-engine.

| | | | | |
|---|-----------------------------|------------------------|--------------------------|---------------------------|
| 1 | $c = \sqrt{\frac{p^2f}{3}}$ | $\sqrt{\frac{5gf}{3}}$ | $\sqrt{\frac{2p^2f}{a}}$ | $\sqrt{\frac{1.75bf}{s}}$ |
| 2 | $p = \sqrt{\frac{3c^2}{f}}$ | $\sqrt{\frac{5g}{f}}$ | $\sqrt{\frac{ac^2}{2f}}$ | $\sqrt{\frac{5.25b}{s}}$ |
| 3 | $f = \frac{3c^2}{p^2}$ | $\frac{3c^2}{5g}$ | $\frac{c^2a}{10g}$ | $\frac{c^2s}{1.75b}$ |
| 4 | $g = \frac{p^2}{5}$ | $\frac{3c^2}{5f}$ | $\frac{c^2a}{10f}$ | $\frac{1.05b}{s}$ |
| 5 | $a = \frac{2p^2f}{c^2}$ | $\frac{10gf}{c^2}$ | $\frac{5gf}{.5c^2}$ | $\frac{10.5bf}{sc^2}$ |
| 6 | $b = \frac{sp^2}{5.25}$ | $\frac{gs}{1.05}$ | $\frac{c^2s}{1.75}$ | $\frac{ac^2s}{10.5f}$ |
| 7 | $s = \frac{1.75bf}{c^2}$ | $\frac{5.25}{p^2}$ | $\frac{1.05b}{g}$ | $\frac{10.5bf}{ac^2}$ |

VOL. X.

In this Table there are four particular values of each letter, which render it more extensively useful than it would have been upon a less scale, because sometimes one value is more convenient for finding the unknown letter or quantity than another; as will be seen in the following examples, in which, to avoid repetitions, it is supposed that the pressure of the atmosphere is six pounds upon a circular inch of the piston, and that the engine goes at the rate of 12 strokes, 6 feet long each, in a minute.

EXAMPLES of the use of the TABLE.

1. Required the size of the cylinder to work a pump of 12 inches diameter, 30 fathoms deep. *Per theorem 1.* $c = \sqrt{\frac{p^2f}{3}}$; therefore $\sqrt{\frac{12 \times 12 \times 30}{3}} = c = 38$ inches.

2. Required the size of the pump that a cylinder of 38 inches diameter can work at 30 fathoms deep. *Per theorem 2.* $p = \sqrt{\frac{3c^2}{f}}$; therefore $\sqrt{\frac{38 \times 38 \times 3}{30}} = p = 12$ inches.

3. Required the depth that a 36-inch cylinder will work a pump of 10 inches diameter. *Per theorem 3.* $f = \frac{3c^2}{p^2}$; therefore $\frac{36 \times 36 \times 3}{10 \times 10} = f = 39$ fathoms.

4. Required the number of gallons drawn at a six-foot stroke per last-mentioned cylinder and pumps. *Per theorem 4.* $g = \frac{p^2}{5}$; therefore $\frac{10 \times 10}{5} = 20$ gal. = g .

5. Required the pressure of the atmosphere on a cylinder of 36 inches, which works a pump 10 inches diameter, 39 fathoms deep. *Per theorem 5.* $a = \frac{2p^2f}{c^2}$; therefore $\frac{10 \times 10 \times 39 \times 2}{36 \times 36} = a = 6$ pounds.

6. Required the hogheads delivered per hour by a pump of 16 inches diameter, at 12 strokes per minute. *Per theorem 6.* $b = \frac{sp^2}{5.25}$; therefore $\frac{16 \times 16 \times 12}{5.25} = b = 585$ hogheads.

7. Required the number of strokes per minute an engine must make to raise 585 hogheads per hour by a 16-inch pump. *Per theorem 7.* $s = \frac{5.25b}{p^2}$; therefore $\frac{585 \times 5.25}{16 \times 16} = s = 12$ strokes.

By these examples it is evident that the quantity sought is discoverable (by the help of the theorems) by one operation only, which without them might have taken several. But it often happens in practice, that an engine has to draw several pumps of different diameters from different depths; in which case the operations will be somewhat different from those above, as will be seen in the following example.

8. Let it be required to find the diameters of the cylinder and pumps to draw 520 hogheads per hour from 30 fathoms deep, 450 hogheads per hour from 20 fathoms deep, and 80 hogheads per hour for the jackhead from 10 fathoms deep, allowing the engine to make 12 six-foot strokes per minute, and the air's pressure 6 pounds upon each circular inch of the piston.

41 K

PER

Per theor 2. $p = \sqrt{\frac{5 \cdot 25}{s}}$; therefore $\sqrt{\frac{520 \times 5 \cdot 25}{12}}$
 $= 15$, the first pump $= x$.

Per ditto, $\sqrt{\frac{450 \times 5 \cdot 25}{12}} = 14$, the 2d pump $= y$.

Per ditto, $\sqrt{\frac{80 \times 5 \cdot 25}{12}} = 6$, the 3d pump $= z$.

Then, per theor. 1. $c = \sqrt{\frac{p^2 f}{3}}$, if the water was to

be raised in one column from a certain depth; but it being in three columns of various dimensions, it is evident from the question, that the power of the cylinder must be a counterpoise to the weight of all these columns; and putting x, y, z , for the three pumps, instead of p , the equation will be $c = \sqrt{\frac{x^2 f + y^2 f + z^2 f}{3}}$, which is $\sqrt{\frac{11030}{3}} = 60.6$

inches, the cylinder's diameter. If there had been a greater number of pumps, the size of the cylinder might have been found in the same manner, by substituting the sum of their squares instead of p^2 in the theorem.

It is the practice of some engineers to allow a longer stroke than six feet; and, although the advantages of it are rather problematical, if that be supposed, for instance, a z feet stroke; then, instead of $p = \sqrt{58}$, and $g = \frac{p^2}{s}$ in the table of theorems, we shall have $p = \sqrt{\frac{58 \times 60}{z}}$, and $g = \frac{p^2}{5 \times 6}$.

On the following page is given a Table, calculated from the foregoing theorems, of the powers of cylinders from 30 to 70 inches diameter; and the diameter and lengths of pumps which those cylinders are capable of working, from a six-inch bore to that of 20 inches, together with the quantity of water drawn per stroke and per hour; allowing the engine to make 12 strokes of 6 feet per minute.

EXPLANATION of the TABLE.

The first column on the left is the diameter of the cylinders from 30 inches to 70. The first line of numbers at the top is the diameters of pumps from 6 to 20 inches; and the numbers in the common angle of meeting are the fathoms in depth which the cylinder is capable of working with any of these pumps. The right-hand column gives the power of the cylinder in pounds, to which it stands opposite, likewise the weight of the columns of water in the same line. Thus the first sum, 5400 pounds, is the power of a 30-inch cylinder; it is also the weight of water contained in 75 fathoms of 6-inch pumps, 55 fathoms of 7 inches diameter, 42 fathoms of 8 inches, 33 fathoms of 9 inches, &c.

The quantity in gallons drawn by a six-foot stroke,

or the quantity contained in one fathom of any of the pumps, is expressed in the lowest line but one; any quantity in this line multiplied by 10.2 will give the weight in pounds of one fathom, if wanted. The lowest line of figures is the number of hogheads drawn in an hour by each pump respectively, when the engine goes 12 strokes per minute.

EXAMPLES of the Use of the TABLE.

1. Required the size of the cylinder to work a pump of 12 inches diameter 30 fathom deep.

Under 12 inches, the diameter of the pump, find the fathoms 30, (or the nearest number to it); and on the same line in the first column is 38 inches, the diameter of the cylinder.

2. Required the size of the pump that a cylinder of 38 inches diameter can work at 30 fathoms deep.

Find 38, the cylinder's diameter in the first column; then in the line from it look for 30 fathoms, or the nearest number to it; and where that is found, the diameter of the pump will be found above: thus 30 fathoms has 12 inches for the pump's diameter.

3. Required the depth that a 36-inch cylinder will work a pump of 10 inches diameter.

Find 36 in the side-column, and 10 in the upper line; and in the common angle of meeting is 39, the fathoms required.

4. Required the number of gallons drawn per stroke by the last-mentioned cylinder and pumps.

Under the diameter 10 of the pump, and in the lowest line but one, is 20, the number of gallons drawn per stroke.

5. Required the hogheads delivered per hour by a 12-inch pump.

Under 12, the pump's diameter, in the lowest line of figures, is 328, the hogheads delivered per hour.

6. Required the diameter of the cylinder and pumps to draw 520 hogheads per hour from 30 fathoms deep, 450 hogheads per hour from 20 fathoms deep, and 80 hogheads per hour from 10 fathoms deep.

In this question take the nearest numbers in the Table: thus 513 hogheads per hour is the nearest to 520, and above it find the fathoms 29, which is nearest to 30; then at the head of that column is 15 inches for the size of the largest pump, and in the right-hand column, opposite 29, is 12,696 lb. the weight of that water; viz. Pump, 15 inches. Weight, 12,696

In the same manner find pump 14 inch. 7776

Also pump 6 inch. 800

The sum is the weight of the whole, 21272

Then, by looking in the last column amongst the powers of cylinders, the nearest number to 21,272 is 21,600; and opposite to it, in the first column, is 60 inches, the diameter of a cylinder capable of working those three pumps.

TABLE.

TABLE of the Power and Effects of STEAM-ENGINES, allowing 12 strokes of 6 feet long each *per* minute, and the Pressure of the Air 7lb. 10oz. *per* square Inch.

We shall now describe the several parts of an engine, and exemplify the application of the foregoing principles in the construction of one of the completest of the modern engines. See Plate CCLXXXIII. fig. 1.

A, Represents the fire-place under the boiler, for the boiling of the water, and the ash-hole below it.

B, The boiler, filled with water about three feet above the bottom, made of iron plates.

C, The steam-pipe through which the steam passes from the boiler into the receiver.

D, The receiver, a close iron vessel, in which is the regulator or steam-cock, which opens and shuts the hole of communication each stroke.

E, The communication-pipe betwixt the receiver and the cylinder; it rises 5 or 6 inches up, in the inside of the cylinder bottom, to prevent the injected water from descending into the receiver.

F, The cylinder, of cast iron, about 10 feet long, bored smooth in the inside; it has a broad flanch in the middle on the outside, by which it is supported when hung in the cylinder-beams.

G, The piston, made to fit the cylinder exactly: it has a flanch rising 4 or 5 inches upon its upper surface, betwixt which and the side of the cylinder a quantity of junk or oakum is stuffed, and kept down by weights, to prevent the entrance of air or water and the escaping of steam.

H, The chain and piston shank by which it is connected to the working-beam.

II, The working-beam or lever: it is made of two or more large logs of timber, bent together at each end, and kept at the distance of 8 or 9 inches from each other in the middle by the gudgeons, as represented in the Plate. The arch-heads, II, at the ends, are for giving a perpendicular direction to the chains of the piston and pump-rod.

K, The pump-rod which works in the sucking-pump L, and draws the water from the bottom of the pit to the surface.

M, A cistern, into which the water drawn out of the pit is conducted by a trough, so as to keep it always full; and the superfluous water is carried off by another trough.

N, The jack-head pump, which is a sucking-pump wrought by a small lever or working-beam, by means of a chain connected to the great beam or lever near the arch *g* at the inner end, and the pump-rod at the outer end. This pump commonly stands near the corner of the front of the house, and raises the column of water up to the cistern O, into which it is conducted by a trough.

O, The jack-head cistern for supplying the injection, which is always kept full by the pump N: it is fixed so high as to give the jet a sufficient velocity into the cylinder when the cock is opened. This cistern has a pipe on the opposite side for conveying away the superfluous water.

PP, The injection-pipe, of 3 or 4 inches diameter, which turns up in a curve at the lower end, and enters the cylinder bottom: it has a thin plate of iron upon the end *a*, with 3 or 4 adjustable holes in it, to permit the jet of cold water from the jack-head cistern to fly up against the piston and condense the steam each stroke, when the injection-cock is open. *a*, A valve upon the upper end of the injection-pipe within the

cistern, which is shut when the engine is not working, to prevent any waste of the water. *f*, A small pipe which branches off from the injection-pipe, and has a small cock to supply the piston with a little water to keep it air-tight.

Q, The working plug, suspended by a chain to the arch *g* of the working-beam. It is usually a heavy piece of timber, with a slit vertically down its middle, and holes bored horizontally through it, to receive pins for the purpose of opening and shutting the injection and steam cocks as it ascends and descends by the motion of the working-beam.

h, The handle of the steam-cock or regulator. It is fixed to the regulator by a spindle which comes up through the top of the receiver. The regulator is a circular plate of brass or cast iron, which is moved horizontally by the handle *h*, and opens or shuts the communication at the lower end of the pipe E within the receiver. It is represented in the Plate by a circular dotted line.

i, The spanner, which is a long rod or plate of iron for communicating motion to the handle of the regulator; to which it is fixed by means of a slit in the latter, and some pins put through to fasten it.

k, The vibrating lever, called the *Z*, having the weight *k* at one end and two legs at the other end. It is fixed to an horizontal axis, moveable about its centre-pins or pivots *m*, by means of the two shanks *o* *p* fixed to the same axis, which are alternately thrown backwards and forwards by means of two pins in the working plug; one pin on the outside depressing the shank *o*, throws the loaded end *k* of the *Z* from the cylinder into the position represented in the plate, and causes the leg *l* to strike against the end of the spanner; which forcing back the handle of the regulator or steam-cock, opens the communication, and permits the steam to fly into the cylinder. The piston immediately rising by the admission of the steam, the working-beam II rises; which also raises the working-plug, and another pin which goes through the slit raises the shank *p*, which throws the end *k* of the *Z* towards the cylinder, and, striking the end of the spanner, forces it forward, and shuts the regulator or steam-cock.

q, The lever for opening and shutting the injection-cock, called the F. It has two toes from its centre, which take betwixt them the key of the injection-cock. When the working-plug has ascended nearly to its greatest height, and shut the regulator, a pin catches the end *q* of the F and raises it up, which opens the injection-cock, admits a jet of cold water to fly into the cylinder, and, condensing the steam, makes a vacuum; then the pressure of the atmosphere bringing down the piston in the cylinder, and also the plug-frame, another pin fixed therein catches the end of the lever in its descent, and, by pressing it down, shuts the injection-cock, at the same time the regulator is opened to admit steam, and so on alternately; when the regulator is shut the injection is open, and when the former is open the latter is shut.

R, The hot well. A small cistern made of planks, which receives all the waste water from the cylinder.

S, The sink-pit, to convey away the water which is injected into the cylinder each stroke. Its upper end is even with the inside of the cylinder bottom, its lower end has a lid or cover moveable on a hinge, which

which serves as a valve to let out the injected water, and shuts close each stroke of the engine, to prevent the water being forced up again when the vacuum is made.

T, The feeding pipe, to supply the boiler with water from the hot well. It has a cock to let in a large or small quantity of water as occasion requires, to make up for what is evaporated; it goes nearly down to the boiler bottom.

U, Two gage-cocks, the one larger than the other, to try when a proper quantity of water is in the boiler: upon opening the cocks, if one give steam and the other water, it is right; if they both give steam, there is too little water in the boiler; and if they both give water, there is too much.

W, A plate which is screwed on to a hole in the side of the boiler, to allow a passage into the boiler for the convenience of cleaning or repairing it.

X, The steam-clack or puppet-valve, which is a brass valve on the top of a pipe opening into the boiler, to let off the steam when it is too strong. It is loaded with lead, at the rate of one pound to an inch square; and when the steam is nearly strong enough to keep it open, it will do for the working of the engine.

f, The snifting valve, by which the air is discharged from the cylinder each stroke which was admitted with the injection, and would otherwise obstruct the due operation of the engine.

tt, The cylinder-beams; which are strong joists going through the house for supporting the cylinder.

v, The cylinder-cap of lead, soldered on the top of the cylinder, to prevent the water upon the piston from flashing over when it rises too high.

w, The waste-pipe which conducts the superfluous water from the top of the cylinder to the hot-well.

xx, Iron bars, called the *catch-pins*, fixed horizontally through each arch-head, to prevent the beam descending too low in case the chain should break.

yy, Two strong wooden sgrings to weaken the blow given by the catch-pins when the stroke is too long.

zz, Two friction-wheels, on which the gudgeon or centre of the great beam is hung; they are the third or fourth part of a circle, and move a little each way as the beam vibrates. Their use is to diminish the friction of the axis, which, in so heavy a lever, would otherwise be very great.

When this engine is to be set to work, the boiler must be filled about three or four feet deep with water, and a large fire made under it; and when the steam is found to be of a sufficient strength by the puppet-clack, then by thrusting back the spanner, which opens the regulator or steam-cock, the steam is admitted into the cylinder, which raises the piston to the top of the cylinder, and forces out all the air at the snifting valve; then by turning the key of the injection-cock, a jet of cold water is admitted into the cylinder, which condenses the steam and makes a vacuum; and the atmosphere then pressing upon the piston, forces it down to the lower part of the cylinder, and makes a stroke by raising the column of water at the other end of the beam. After two or three strokes are made in this manner, by a man opening and shutting the cocks to try if they be right, then the pins may be put into the pin-holes in the working plug,

and the engine left to turn the cocks of itself; which it will do with greater exactness than any man can pretend to do.

There are in some engines different methods of shutting and opening the cocks than in the one above described, but perhaps none better adapted to the purpose; and as the principles on which they all act are originally the same, any difference in the mechanical construction of the small machinery will have no influence of consequence upon the total effect of the grand machine.

The furnace or fire-place should not have the bars so close as to prevent the free admission of fresh air to the fire, nor so open as to permit the coals to fall through them; for which purpose two inches or thereabouts is sufficient for the distance betwixt the bars. The size of the furnace depends upon the size of the boiler; but in every case the ash-hole ought to be capacious to admit the air, and the greater its height the better. If the flame is conducted in a flue or chimney round the outside of the boiler, or in a pipe round the inside of it, it ought to be gradually diminished from the entrance at the furnace to its egress at the chimney; and the section of the chimney at that place should not exceed the section of the flue or pipe, and should also be somewhat less at the chimney-top.

The boiler or vessel in which the water is rarefied by the force of fire, may be made of iron-plates, cast iron, or such other materials as can withstand the effects of the fire, and the elastic force of the steam. It may be considered as consisting of two parts; the upper part which is exposed to the steam, and the under part which is exposed to the fire. The form of the latter should be such as to receive the full force of the fire in the most advantageous manner, so that a certain quantity of fuel may have the greatest possible effect in heating and evaporating the water; which is best done by making the sides cylindrical, and the bottom a little concave, and then conducting the flame by an iron flue or pipe round the inside of the boiler beneath the surface of the water, before it reach the chimney. For, by this means, after the fire in the furnace has heated the water by its effect on the bottom, the flame heats it again by the pipe being wholly included in the water, and having every part of its surface in contact with it; which is preferable to carrying it in a flue or chimney round the outside of the boiler, as a third or a half of the surface of the flame only could be in contact with the boiler, the other being spent upon the brick-work. This cylindrical lower part may be less in its diameter than the upper part, and may contain from four to six feet perpendicular height of water in it.

The upper part of the boiler is best made hemispherical, for resisting the elasticity of the steam; yet any other form may do, provided it be of sufficient strength for the purpose. The quick going of the engine depends much on the capaciousness of the boiler-top; for if it be too small, it requires the steam to be heated to a great degree, to increase its elastic force so much as to work the engine. If the top is so capacious as to contain eight or ten times the quantity of steam used each stroke, it will require no more fire to preserve its elasticity than is sufficient to keep the water in a proper state of boiling; this, therefore, is the

the best size for a boiler-top. If the diameter of the cylinder be c , and works a six-foot stroke, and the diameter of the boiler supposed b , then $200c^2 = b^2$, or

$$b = \sqrt{200c^2}.$$

The effect of the injection in condensing the steam in the cylinder, depends upon the height of the reservoir and the diameter of the adjutage. If the engine makes a six-foot stroke, then the jackhead cistern should be twelve feet perpendicular above the bottom of the cylinder or the adjutage. The size of the adjutage may be from one to two inches in diameter; or if the cylinder be very large, it is proper to have three or four holes rather than one large one, in order that the jet may be dispersed the more effectually over the whole area of the cylinder. The injection-pipe, or pipe of conduct, should be so large as to supply the injection freely with water: if the injection-pipe be called p , and the diameter of the adjutage a , then

$$4a^2 = p^2, \text{ and } a^2 = \frac{p^2}{4}.$$

Mr Watt's improved engine.

Mr James Watt of Birmingham having lately obtained a patent for an improvement of the steam-engine above-described, we shall give an account of this improvement, and point out in what the advantage of it consists.

The cylinder, or steam-vessel, A, of this engine, (see Plate CCLXXIII. fig. 2.) is shut at bottom and open at top, as usual; and is included in an outer cylinder or case BB, of wood or metal, covered with materials which transmit heat slowly. This case is at a little distance from the cylinder, and is shut at both ends; the cover C has a hole in it through which the piston-rod E slides; and near the bottom is another hole F, by which the steam from the boiler has always free entrance into this case or outer cylinder, and by the interstice GG between the two cylinders has access to the upper side of the piston HH. To the bottom of the inner cylinder A is joined a pipe I, with a cock or valve K, which is opened and shut when necessary, and forms a passage to another vessel L called a *condenser*, made of thin metal. This vessel is immersed in a cistern M full of cold water, and is contrived in such a manner as to expose a very great surface externally to the water, and internally to the steam. It is also made air-tight, and has pumps N wrought by the engine, which keep it always exhausted of air and water.

Both the cylinders A and BB being filled with steam, the passage K is opened from the inner one to L the condenser, into which the steam rushes with violence by its elasticity, because that vessel is exhausted; but it no sooner enters it, than coming into contact with the cold matter of the condenser, it is reduced to water, and the vacuum still remaining, the steam continues to rush in until the inner cylinder A below the piston is left empty. The steam which is above the piston ceasing to be counteracted by that which was below it, acts upon the piston HH, and forces it to descend to the bottom of the cylinder, and so raises the bucket of the pump by means of the lever. The passage K between the inner cylinder and the condenser is then shut, and another passage O is opened, which permits the steam to pass from the outer cylinder, or from the boiler into the inner cylinder under the piston; and then the superior weight

of the bucket and pump-rods pulls down the outer end of the lever or great beam, and raises the piston, which is suspended to the inner end of the same beam.

The advantages that accrue from this construction are, first, that the cylinder being surrounded with the steam from the boiler, is kept always uniformly as hot as the steam itself, and is therefore incapable of destroying any part of the steam which should fill it, as the common engines do. Secondly, the condenser being kept always as cold as water can be procured, and colder than the point at which it boils *in vacuo*, the steam is perfectly condensed and does not oppose the descent of the piston; which is therefore forced down by the full power of the steam from the boiler, which is somewhat greater than that of the atmosphere.

In the common fire-engines, when they are loaded to seven pounds upon the inch, and are of a middle size, the quantity of steam which is condensed in restoring to the cylinder the heat which it had been deprived of by the former injection of cold water, is about one full of the cylinder, besides what really it required to fill that vessel; so that twice the full of the cylinder is employed to make it raise a column of water equal to about seven pounds for each square inch of the piston: or, to take it more simply, a cubic foot of steam raises a cubic foot of water about eight feet high, besides overcoming the friction of the engine, and the resistance of the water to motion.

In the improved engine, about one full and a fourth of the cylinder is required to fill it, because the steam is one-fourth more dense than in the common engine. This engine raises a load equal to 12 pounds and a half upon the square inch of the piston; and each cubic foot of steam of the density of the atmosphere, raises one cubic foot of water 22 feet high.

STEATITES, in the history of fossils, a name given by late authors to a substance called in English *soap-earth*. Dr Woodward much recommends it as a substance for making porcelain; and repeated trials of it have been made since his time, and some of them very lately; in all which it has afforded the finest earthen-ware ever made with us, and promises fair, with good management, for the equalling any in the world. It is dug in many parts of Devonshire and Cornwall, and the neighbouring counties; the cliff of the Lizard-point is almost wholly composed of it, and the adjacent little islands abound with it; and from all these places it might be brought, at a small expence, in any quantities. It is known from all other earths by these characters: it is composed of extremely fine particles; and is of a firm, equal, and regular texture, and a great weight. It is very firm and hard as it lies in the earth; but when it has been some time exposed to the air, it becomes almost of a stony hardness. It is of a perfectly fine, smooth, and glossy surface, softer to the touch than any other species of earth, and does not at all adhere to the tongue, or stain the fingers in handling; but, drawn along a rough surface, as a piece of cloth, or the like, it marks it with a fine and even white line. In colour it is a clear white, veined and variegated very beautifully with purple of different degrees of deepness; and is of so fine a structure of parts, that when cut into thin pieces it is in some degree transparent. It makes

no effervescence with acids; and burns to a pure white, even in its purple parts. This substance is found to contain in great quantity the fine white earth called *magnesia alba*.

STEATOMA, a kind of encysted tumour, consisting of a matter like suet or lard, soft, without pain, and without discolouring the skin.

STEEL, a very hard and fusible kind of iron.

Stahl, Cramer, and all good chemists, justly consider steel as an improved iron, which is possessed of a larger quantity of inflammable principle, so necessary to all metals, and which really contains fewer heterogeneous, and more metallic, parts than an equal bulk of iron. We shall be convinced of this truth by a description and explanation of the methods of converting iron into steel, and by examining the characteristic properties of steel.

Steel may be made by fusion or by cementation. The first method is used to convert iron into steel immediately from the ore. All ores of iron are not used indifferently for this purpose; because some of these, which are therefore called *ores of steel*, are much fitter than others to furnish good steel; and the steel extracted from them is called *natural steel* (A).

The other method of making steel consists in choosing the best forged iron, or that which is most malleable, whether it be hot or cold; and impregnating this iron with a larger portion of inflammable principle, by cementation alone, without fusion.

To understand well these methods of making steel, we must attend to two essential properties of iron. The first is, that of all metals it is the most difficultly fusible; and that therefore, although, in the melting of its ores, its fusion be much assisted by the sulphureous parts of the ore itself; yet, as these parts are always expelled as much as is possible, iron never enters into so thin and perfect a fusion as the other metals.

The second property of iron to which we ought to attend is, that the earth of this metal is capable of

combining with the inflammable principle, and of being metallised without fusion.

These things being premised, it happens, in consequence of the former property, that, in the first fusion of ores of iron, we obtained only a hard and brittle iron, both from the sulphureous parts from which this iron is not entirely disengaged, and from the presence of a greater or less quantity of earthy matters, which are either unmetallic; or which, if they be ferruginous, have not been metallised, from want of immediate contact with the phlogiston of the fuel.

We may easily perceive that these earthy parts, unmetallic or not metallised, cannot be entirely separated from the perfect iron, because the fusion is not sufficiently thin for that purpose: but in proportion as the iron is deprived of sulphur, its fusion becomes more and more difficult, and we are obliged to have recourse to another expedient than fusion to disengage it from its earthy parts, which in the first melting remain intercepted betwixt the metallic parts. This expedient is the forge. The impure iron intended to be rendered malleable is to be heated red-hot, and struck by a very heavy hammer.

This perculsion, that iron softened by heat sustains, presses strongly, and folders or welds together the metallic parts, which alone are capable of uniting together; and obliges the unmetallic parts, which are incapable of uniting with the metal, to separate. By this operation these unmetallic parts are pressed between the parts of the iron, and driven by degrees to the surface of the metal, from which they are detached in form of dust and scales. This treatment, which is a kind of kneading of the iron, is to be repeated till it has acquired the proper degree of purity and ductility.

The operations by which steel is to be extracted from its ores are essentially the same as those employed for iron; but they differ from them in being much more exact; that an iron still purer, more filled with phlogiston,

(A) Steel is made sometimes directly from the ore, but more frequently from crude or cast iron. These methods of making steel are not known in England; but are practised in Sweden and other parts of Europe. The process for making steel from cast-iron is thus described by Swedenborgius, as it is performed in Dalecarlia.

The ore from which the crude iron to be converted into steel is obtained is of a good kind. It is black, friable, and composed of many small grains; and it produces very tough iron. The conversion into steel is made upon a forge-hearth, something smaller than common. The sides and bottom are made of cast-iron. The tuyere is placed, with very little inclination, on one of the side-plates. The breadth of the fire-place is 14 inches; its length is greater. The lower part of the tuyere is six one-half inches above the bottom. In the interior part of the fire-place, there is an oblong opening for the flowing of the superfluous scoria. The workmen first put scoria on the bottom, then charcoal and powder of charcoal, and upon these the cast-iron run or cut into small pieces. They cover the iron with more charcoal, and excite the fire. When the pieces of iron are of a red-white, and before they begin to melt, they stop the bellows, and carry the mass under a large hammer, where they break it into pieces of three or four pounds each. The pieces are again brought to the hearth, and laid within reach of the workman, who plunges some of them into the fire, and covers them with coal. The bellows are made to blow slowly till the iron is liquified. Then the fire is increased; and when the fusion has been long enough continued, the scoria are allowed to flow out; and at that time the iron hardens. The workman adds more of the pieces of crude iron, which he treats in the same manner, and so on a third and a fourth time, till he obtains a mass of steel of about a hundred pounds, which is generally done in about four hours. This mass is raised and carried to the hammer, where it is forged, and cut into four pieces, which are further beat into square bars four or five feet long. When the steel is thus forged, it is thrown into water, that it may be easily broken; for it is yet crude and coarse-grained. The steel is now carried to another hearth similar to the former, and there broken in pieces. These pieces are laid regularly in the fire-place, first two parallel, upon which seven or eight others are placed across, then a third row across the second, in such a manner that there is space left between those of the same row. The whole is then covered with charcoal, and the fire is excited. In about half or three quarters of an hour the pieces are made hot enough, and are then taken from the fire, one by one, to the hammer, to be forged into little bars from half a foot to two feet long, and while hot, are thrown into water to be hardened. Of these pieces 16 or 20 are put together, so as to make a bundle, which is heated and welded, and afterwards forged into bars four inches thick, which are then broken into pieces of convenient length for use.

Steel.

giston, and better disengaged from its earthy parts, may be obtained.

To succeed in this intention, much smaller quantities must be fused at once than when iron is to be extracted from its ore. Pieces of the first fusion are to be put into crucibles filled and covered with charcoal, and exposed to a violent heat excited by strong bellows. These pieces are to be well fused, and kept in fusion a longer or shorter time, according to the nature of the ore; after which they are to be forged, as iron is; but always in much smaller pieces, and till they are become perfectly ductile both when hot and when cold. Nothing then remains but to temper the steel, of which we shall presently speak.

In these operations, which are to be several times repeated, the iron that is changed into steel must evidently be much better purified, and furnished with a much greater quantity of inflammable principle, than in the smeltings and fusions of large quantities of iron. As the masses of metal are small in these operations for the procuring of steel, and as they are surrounded with a much larger proportion of charcoal, the fusion is not only more complete, by which the separation of the earthy unmetallic parts is much promoted; but also a greater number of ferruginous parts are well metallized; and as all these parts of iron are in more intimate contact with the charcoal, which is capable of supplying them with inflammable principle, they receive the whole quantity of this principle with which they can unite.

The same observation may be applied to the operation of the forge practised upon smaller masses; for the heterogeneous parts are much more easily and copiously pressed out of small masses than great.

This exact purification of iron, by which it is converted into steel, must evidently be attended with considerable loss, or diminution, from the separation of all its heterogeneous parts. This diminution amounts to nearly one half of the weight of the iron. This great loss does not proceed altogether from the separation of heterogeneous parts; for in all the operations used for this separation, some part of the metal is always destroyed and burnt, although all possible precautions are taken to diminish this inconvenience, by securing the melted or red-hot metal from the contact of external air as much as is possible.

Artificial steel is made without fusion from iron ready forged. The chief point to be attended to in the making of the best artificial steel, is to choose the iron which is most perfect and most malleable either when it is hot or cold; which quality always shows that the iron is well purified. It is first to be forged into plates or bars, rather small than large, according to the works for which it is intended; and it is then to be cemented with matters capable of giving to it much inflammable principle. The matters which compose this cement vary according to the uses of different manufacturers. They are all good, provided they contain no sulphur, or vitriolic acid, which might form sulphur during the operation; because sulphur, having much affinity with iron, would certainly unite with this metal, would entirely or partly fuse it, and would, by reducing it to a mineral or pyritous state, give to it qualities very different from those which good steel ought to have.

Steel.

The matters which enter into the composition of the cement for steel, are the coals of animal or vegetable substances, mixed with ashes, calcined bones, and other matters of this kind. Mr Cramer proposes these two following receipts of cements for steel, which appear to be very good.

Take one part of powder of charcoal, half a part of wood-ashes, and mix them very well together. Or,

Take two parts of charcoal, moderately pulverized: one part of bones, horns, hair or skins of animals, burnt in close vessels to blackness, and powdered; half a part of wood-ashes; and mix them well together.

When steel is to be made, the bars of iron are to be placed vertically in a cylindrical crucible, which ought to be three inches higher than the bars, and into which a stratum of the cement of about the thickness of a finger has been previously put and pressed down. The bars ought to be about an inch distant from each other, and from the sides of the crucible. The interstices and crucible are then to be filled with cement, so that the bars shall be covered with about the thickness of two inches at least. The crucible, previously covered with a lid which fits it exactly, and which must be carefully luted with clay mixed with sand, is to be placed in a furnace where an equal fire is to be kept, so that the crucible shall be red-hot during eight or ten hours: the iron will then be found to be converted into steel, which will be so much better as the iron employed was of a better quality: it then only requires to be tempered. We may observe, that in this operation the iron suffers no diminution of weight, and no scoria appear upon its surface, as Mr Cramer remarks. By the sole addition, therefore, of a new quantity of phlogiston, the iron acquires the quality of steel. Thus, if this iron contained some parts of martial earth which was not metallized, by the cementation they are metallized, and the iron or steel are thereby improved: but if the iron contained some earthy unmetallic parts, they are not separated by this operation, because the metal has not been fused: and as the best forged iron which is usually sold, is never so well purified from these extraneous matters, as that which is converted into steel in the great works for procuring steel from the ore of iron; hence, in general, artificial steel made by cementation is not so perfect as that made by fusion.

We may observe, that, in the cementation above described, the iron combines with a part of the phlogiston of the cement, without fusion; which effect proceeds from a peculiar property of the earth of iron, by which it is capable of combining with the inflammable principle, and of being metallized without fusion, which is, nevertheless, necessary for the reduction of all other metallic earths.

The steel which has received only the above-mentioned preparations differs from iron in its colour, which is more dark and brown; in its grain, which is finer and closer; in possessing a greater ductility, flexibility, and softness; but the great difference of steel from iron, which renders it more valuable for many purposes and arts, is the extreme hardness it acquires by being tempered.

This operation is very simple. It consists in making steel red-hot, and then in plunging it suddenly in cold water. In an instant all the qualities of this steel

Plate CCLXXIII.
STEAM-ENGINE.

Fig. 2.

Fig. 1.

Steel.

are changed by this tempering; so that from being very ductile and soft, it becomes so hard and so stiff, that it is no longer capable of being cut by the file; but is itself capable of cutting or piercing very hard bodies: that it does not yield to the hammer; but may be sooner broken in pieces like a flint, than be extended. It is sonorous, brittle, very elastic, and capable of acquiring the most lively and most beautiful polish, as we see in finely-wrought toys of steel.

The use of this metal is very extensive for numberless convenient and necessary utensils of all sorts, of which without it we should absolutely be deprived: but what renders its use still more general is, that we can diversify at pleasure its hardness and ductility, by varying the temper. The hotter the steel is when tempered, and the colder the water into which it is plunged, the greater hardness it acquires; but, at the same time, it becomes so much more brittle. This very hard temper is necessary for certain tools designed to cut very hard bodies. On the contrary, the less hot the steel is when tempered, and the hotter the water is in which it is tempered, the less hard it becomes, and also the greater ductility it retains; and hence many tools may be made of it fit for cutting bodies moderately hard, which tools are less liable to have their points broken or their edges notched, than if they were made of a harder steel.

No other general rule can be given for the tempering of steel than that we have mentioned. The proper degree of heat is always relative to the use to which the tools to be made of this steel are to be applied.

Another very convenient property of steel is, that after it has been tempered, it may be again untempered and softened to any degree that we think proper; for which purpose we have only to heat it more or less, and to let it cool slowly. By this method we may soften the hardest-tempered steel.

As the temper is a very essential point with regard to steel, and that the best is in general that which gives the greatest hardness, and destroys the least of the ductility of the metal, various substances are used into which steel to be tempered is plunged. Such are rust, oil, urine; water impregnated with foot, with sal ammoniac, or with other salts. These particular methods are the bases of many secrets in different manufactures; their advantages cannot be ascertained without a very accurate and continued examination. Very interesting researches remain to be made on this subject.

Steel is usually fold tempered, because, in many manufactures of it, the custom is to temper it as soon as it is made, probably that the purchasers of it may be the better able to judge of its quality. When this steel is to be used, it must be untempered, that it may be extended, filed, and receive the form intended to be given to it; after which each workman tempers it again in his manner. But we also find amongst merchants English steel in small bars, which is not tempered, and which is very good.

Well-polished plates of steel, put on a gentle fire of charcoal, acquire different colours on their surface, and pass successively through several shades, as they become hotter, in the following order: white, yellow, orange, purple, violet, and lastly blue, which disap-

Vol. X.

pears and leaves a water-colour, if the steel has been heated too much or too long. These different shades mark the degree of heat or of annealing applied to different tools or utensils. The most generally used shade is the blue, such as that given to steel-springs.

One of the most important properties of steel is the magnetic quality, which it is capable of acquiring much better than iron. Good mariners compasses cannot be made without needles of steel.

From what has been said, we may judge that steel is much better purified iron than any other, impregnated with a larger quantity of inflammable principle, and hardened by the temper. Some celebrated natural philosophers, but who were not chemists, have advanced, that steel was only iron which still retained something of its mineral nature, and that its state was intermediate betwixt that of cast-iron and soft forged iron. But this opinion is manifestly erroneous. They have been deceived by the hardness and brittleness of cast-iron, which are nearly as great as in steel. But these qualities proceed from a remaining part of the mineralising substances, which leave it a pyritous character, very different from that of true steel; since this can only be hardened by the temper, and since in the preparation of it all sulphureous matter must be carefully avoided. The mistake of these authors proceeded from their ignorance of the inflammable principle, the properties of which have been so well explained by the illustrious Stahl, and from their being led into an error by the old chemists, who perpetually confounded phlogiston, or the purest and simplest inflammable principle of all bodies, with sulphur, with sulphureous matters, and with most other inflammable compounds.

Steel may be unmade, or reduced to the state of iron, by a management similar to that by which it is made, that is, by cementation. But the cement used for this purpose must be composed of substances entirely free from inflammable matter, and rather capable of absorbing it, as calcareous earth and quicklime are. By a cementation then with these matters, continued during eight or ten hours, steel is reduced to the state of iron.

Stahl considers it as an undecided question, whether steel be more fusible than iron, and says, that the workmen cannot decide it from the violence of fire necessary to melt either of them. He believed, with reason, that this question might be decided by melting these metals in the focus of a burning speculum. Mr Macquer says, that by this method he found steel much more fusible than iron. This greater fusibility of steel can be only attributed to the greater quantity of phlogiston united with it, as phlogiston is in general the cause of the fusibility of metals.

By conversion of iron into steel, this metal acquires a closer, more compact, and finer grained texture, greater hardness, elasticity, tenacity, density, sonorousness, and disposition to receive the magnetic property; and, as some say, an increase of weight. It is also rendered less liable to rust by exposure to air; and less liable to emit sparkles when heated. The colours or irises which steel acquires by exposure to heat, and which are marks by which workmen know when any acquired heat is given, are not peculiar to steel and iron, but may also be produced by the same means on all

Steel.

Steel.

other calcinable metals. These colours proceed from a calcination gradually advancing on that part of the metals which is exposed to air. And as the particles of metals in their different degrees of calcination are possibly of different sizes, so they must acquire (according to Sir Isaac Newton's theory, which shows that the colours of bodies depend on the size of their integrant parts) different reflective powers, and exhibit changes of colours.

Steel may be made by fusion from the ore, or by cementation of forged iron with inflammable matters. Anciently, steel is said to have been made by immersing forged iron during some time in melted crude iron. Forged iron may also be changed into steel, as Wallerius affirms, by immersing in melted scoria; or by fusion with black flux, glass-gall, or borax; or by strewing sea-salt upon heated iron, and extinguishing it in dung.

Various opinions are formed concerning the cause of the difference between iron and steel. The most general opinion attributes this difference to the presence of a larger quantity of phlogiston in the latter than in the former. Some authors, attending chiefly to the method of conversion by fusion, consider that operation only as a purification of the iron from earthy and heterogeneous particles, and steel merely as a more pure and perfect iron. Others, observing some similitude in the texture of steel to certain kinds of cast-iron, and the hardness of both these, without attending to their essential differences, have imagined that the state of steel was intermediate betwixt that of cast and that of forged iron. Lastly, some metallurgists maintain, that the conversion of iron into steel is effected, not by absorption of phlogiston, but by expulsion of sulphurous or acid particles. To support this opinion, they observe, 1. That steel is less disposed than iron to rust; the cause of rust being, as they think, an acid contained in iron. 2. That steel emits fewer sparkles under the hammer than iron, which sparkles are found to be most frequent in iron abounding with sulphur, as in red-short iron. 3. That iron may be converted into steel by cementation with alkaline salts, capable of attracting the acid and sulphur. 4. That in the preparation of steel by fusion, the metal is rather exposed to a dissipation of its inflammable parts and burnt, than further phlogistified; and that this operation is accordingly called by workmen the *burning of steel*.

In the preparation of steel by fusion, probably much of the earthy matters contained in the iron may be separated, and any contained acid or sulphur may be burnt or dissipated. But the conversion of steel into iron by cementation with absorbent earths, in which operation no acid or sulphur can be absorbed by the metal, shows that the difference between iron and steel does not consist in the presence of an acid or of sulphur in the iron, but rather in the presence of some substance in the steel, which the inflammable cementing substance can give to it, and of which absorbent earths can deprive it. This substance has been generally believed to be phlogiston: by the addition of which the metal acquires a new texture, together with the hardness, elasticity, and other peculiar properties of steel.

The affinities and medicinal virtues of steel are the same as those of iron. See IRON.

Salt of STEEL. See CHEMISTRY, n° 146.

STEEL-YARD. See BALANCE.

STEELE (Sir Richard), was born about the year 1676 in Ireland; in which kingdom one branch of the family was possessed of a considerable estate in the county of Wexford.—His father, a counsellor at law in Dublin, was private secretary to James Duke of Ormond: but he was of English extraction; and his son, while very young, being carried to London, he put him to school at the Charter-house, whence he was removed to Merton College in Oxford. Our author left the university, which he did without taking any degree, in the full resolution to enter into the army. This step was highly displeasing to his friends; but the ardour of his passion for a military life rendered him deaf to any other proposal. Not being able to procure a better station, he entered as a private gentleman in the horse-guards, notwithstanding he thereby lost the succession to his Irish estate. However, as he had a flow of good-nature, a generous openness and frankness of spirit, and a sparkling vivacity of wit, these qualities rendered him the delight of the soldiery, and procured him an ensign's commission in the guards. In the mean time, as he had made choice of a profession which set him free from all the ordinary restraints in youth, he spared not to indulge his inclinations in the wildest excesses. Yet his gaieties and revels did not pass without some cool hours of reflection; and in these it was that he drew up his little treatise intitled *The Christian Hero*, with a design, if we may believe himself, to be a check upon his passions. For this use and purpose it had lain some time by him, when he printed it in 1701, with a dedication to Lord Cutts, who had not only appointed him his private secretary, but procured for him a company in Lord Lucas's regiment of Fusiliers. The above religious piece injuring his reputation among his gay companions, he endeavoured to enliven his character by writing that excellent comedy the *Funeral*.

This play procured him the regard of King William, who resolved to give him some essential marks of his favour; and though, upon that prince's death, his hopes were disappointed, yet, in the beginning of Queen Anne's reign, he was appointed to the profitable place of Gazetteer. He owed this post to the friendship of Lord Halifax and the Earl of Sunderland, to whom he had been recommended by his school-fellow Mr Addison. That gentleman also lent him an helping hand in promoting the comedy called *The Tender Husband*, which was acted in 1704 with great success. But his next play, *The Lying Lover*, found a very different fate. Upon this rebuff from the stage, he turned the same humorous current into another channel; and early in the year 1709, he began to publish the *Tatler*; which admirable paper was undertaken in concert with Dr Swift. His reputation was perfectly established by this work; and, during the course of it, he was made a commissioner of the stamp-duties in 1710. Upon the change of the ministry the same year, he sided with the duke of Marlborough, who had several years entertained a friendship for him; and upon his Grace's dismissal from all employments in 1711, Mr Steele addressed a letter of thanks to him for the services done to his country. However, as our author still continued to hold his place in the stamp-office.

Steel,
Steel.

Steele.

office under the new administration, he forbore entering with his pen upon political subjects; but, adhering more closely to Mr Addison, he dropt the *Tatler*, and afterwards, by the assistance chiefly of that steady friend, he carried on the same plan, under the title of *The Spectator*. The success of this paper was equal to that of the former; which encouraged him, before the close of it, to proceed upon the same design in the character of the *Guardian*. This was opened in the beginning of the year 1713, and was laid down in October the same year. But in the course of it his thoughts took a stronger turn to politics: he engaged with great warmth against the ministry; and being determined to prosecute his views that way by procuring a seat in the house of commons, he immediately removed all obstacles thereto. For that purpose, he took care to prevent a forcible dismissal from his post in the stamp-office, by a timely resignation of it to the Earl of Oxford; and at the same time gave up a pension, which had been till this time paid him by the queen as a servant to the late prince George of Denmark. This done, he wrote the famous *Guardian* upon the demolition of Donkirk, which was published Aug. 7. 1713; and the parliament being dissolved the next day, the *Guardian* was soon followed by several other warm political tracts against the administration. Upon the meeting of the new parliament, Mr Steele having been returned a member for the borough of Stockbridge in Dorsetshire, took his seat accordingly in the house of commons; but was expelled thence in a few days after, for writing the close of the paper called the *Englishman*, and one of his political pieces intitled the *Crisis*. Presently after his expulsion, he published proposals for writing the history of the duke of Marlborough; at the same time he also wrote the *Spinster*; and, in opposition to the *Examiner*, he set up a paper called the *Reader*, and continued publishing several other things in the same spirit till the death of the queen. Immediately after which, as a reward for these services, he was taken into favour by her successor to the throne king George I. He was appointed surveyor of the royal stables at Hampton-Court, governor of the royal company of comedians, put into the commission of the peace for the county of Middlesex, and in 1715 received the honour of knighthood. In the first parliament of that king, he was chosen member for Boroughbridge in Yorkshire; and, after the suppression of the rebellion in the north, was appointed one of the commissioners of the forfeited estates in Scotland. In 1718, he buried his second wife, who had brought him a handsome fortune and a good estate in Wales; but neither that, nor the ample additions lately made to his income, were sufficient to answer his demands. The thoughtless vivacity of his spirit often reduced him to little shifts of wit for its support; and the project of the Fish-pool this year owed its birth chiefly to the projector's necessities. The following year he opposed the remarkable peerage bill in the house of commons; and, during the course of this opposition to the court, his licence for acting plays was revoked, and his patent rendered ineffectual, at the instance of the lord chamberlain. He did his utmost to prevent so great a loss; and finding every direct avenue of approach to his royal master effectually barred against him by his powerful adver-

sary, he had recourse to the method of applying to the public, in hopes that his complaints would reach the ear of his sovereign, though in an indirect course, by that canal. In this spirit he formed the plan of a periodical paper, to be published twice a-week, under the title of the *Theatre*; the first number of which came out on the 2d of January 1719-20. In the mean time, the misfortune of being out of favour at court, like other misfortunes, drew after it a train of more. During the course of this paper, in which he had assumed the feigned name of *Sir John Edgar*, he was outrageously attacked by Mr Dennis, the noted critic, in a very abusive pamphlet, intitled *The Character and Conduct of Sir John Edgar*. To this insult our author made a proper reply in the *Theatre*.

While he was struggling with all his might to save himself from ruin, he found time to turn his pen against the mischievous South-Sea scheme, which had nearly brought the nation to ruin in 1720; and the next year he was restored to his office and authority in the play-house in Drury-Lane. Of this it was not long before he made an additional advantage, by bringing his celebrated comedy called the *Conscious Lovers* upon that stage, where it was acted with prodigious success; so that the receipt there must have been very considerable, besides the profits accruing by the sale of the copy, and a purse of 500 l. given to him by the king, to whom he dedicated it. Yet notwithstanding these ample recruits, about the year following, being reduced to the utmost extremity, he sold his share in the play-house; and soon after commenced a law-suit with the managers, which in 1726 was determined to his disadvantage. Having now again, for the last time, brought his fortune, by the most heedless profusion, into a desperate condition, he was rendered altogether incapable of retrieving the loss, by being seized with a paralytic disorder, which greatly impaired his understanding. In these unhappy circumstances, he retired to his seat at Llanganor near Caermarthen in Wales, where he paid the last debt to nature on the 21st of September 1729, and was privately interred, according to his own desire, in the church of Caermarthen. Among his papers were found the manuscripts of two plays, one called *The Gentlemen*, founded upon the eunuch of Terence, and the other intitled *The School of Action*, both nearly finished.

Sir Richard was a man of undissimble and extensive benevolence, a friend to the friendless, and, as far as his circumstances would permit, the father of every orphan. His works are chaste and manly. He was a stranger to the most distant appearance of envy or malevolence; never jealous of any man's growing reputation; and so far from arrogating any praise to himself from his conjunction with Mr Addison, that he was the first who desired him to distinguish his papers. His greatest error was want of economy; however, he was certainly the most agreeable, and (if we may be allowed the expression) the most innocent, rake that ever trod the rounds of indulgence.

STEPPLE, an appendage erected generally on the western end of churches, to hold the bells. Steeples are denominated from their form, either spires or towers: the first are such as ascend continually diminishing either conically or pyramidally; the latter are mere parallelopipeds, and are covered a-top platform-

Steele.
Steeples.

Steerage,
Steering.

STEERAGE, on board a ship, that part of the ship next below the quarter-deck, before the bulk-head of the great cabin where the steersman stands, in most ships of war. See **STEERING**.

STEERING, in navigation, the art of directing the ship's way by the movements of the helm; or of applying its efforts to regulate her course when she advances.

The perfection of steering consists in a vigilant attention to the motion of the ship's head, so as to check every deviation from the line of her course in the first instant of its motion; and in applying as little of the power of the helm as possible. By this she will run more uniformly in a straight path, as declining less to the right and left; whereas, if a greater effort of the helm is employed, it will produce a greater declination from the course, and not only increase the difficulty of steering, but also make a crooked and irregular track through the water. See **HELM**.—The helmsman should diligently watch the movements of the head by the land, clouds, moon, or stars; because, although the course is in general regulated by the compass, yet the vibrations of the needle are not so quickly perceived, as the fallies of the ship's head to the right or left, which, if not immediately restrained, will acquire additional velocity in every instant of their motion, and demand a more powerful impulse of the helm to reduce them; the application of which will operate to turn her head as far on the contrary side of her course.—The phrases used in steering a ship vary according to the relation of the wind to her course. Thus, if the wind is fair or large, the phrases used by the pilot or officer who superintends the steerage, are *port, starboard, and steady*. The first is intended to direct the ship's course farther to the right; the second is to guide her farther to the left; and the last is designed to keep her exactly in the line whereon she advances, according to the course prescribed. The excess of the first and second movement is called *hard-a-port*, and *hard-a-starboard*; the former of which gives her the greatest possible inclination to the right, and the latter an equal tendency to the left.—If, on the contrary, the wind is foul or scant, the phrases are *luff, thus, and no nearer*: the first of which is the order to keep her close to the wind; the second, to retain her in her present situation; and the third, to keep her falls full.

In a ship of war, the exercise of steering the ship is usually divided amongst a number of the most expert sailors, who attend the helm in their turns; and are

accordingly called *timoneers*, from the French term *timonier*, which signifies "helmsman." The steerage is constantly supervised by the quarter-masters, who also attend the helm by rotation. In merchant-ships every seaman takes his turn in this service, being directed therein by the mate of the watch, or some other officer.—As the safety of a ship, and all contained therein, depend in a great measure on the steerage or effects of the helm, the apparatus by which it is managed should often be diligently examined by the proper officers. Indeed, a negligence in this important duty appears almost unpardonable, when the fatal effects which may result from it are duly considered.

STEGANIUM. See **SLATE**.

STEGANOGRAPHY, the art of secret writing, or of writing in ciphers, known only to the persons corresponding. See **CIPHER**.

STELLATE, among botanists, expresses leaves which grow not less than six at a joint, and are arranged like the rays of a star.

STELLIONATE, in the civil law, a kind of crime committed by a fraudulent bargain, where one of the parties sells a thing for what it is not; as if I sell an estate for my own which belongs to another, or convey a thing as free and clear which is already engaged to another, or put off copper for gold, &c.

STEM, in botany, that part of a plant arising out of the root, and which sustains the leaves, flowers, fruits, &c. By washing and rubbing the stems of trees their annual increase is promoted; for the method of doing which, see the article **TREE**.

Stem of a Ship, a circular piece of timber into which the two sides of a ship are united at the fore-end: the lower end of it is scarfed to the keel, and the bowsprit rests upon its upper end. The stem is formed of one or two pieces, according to the size of the vessel; and as it terminates the ship forward, the ends of the wales and planks of the sides and bottom are let into a groove or channel, in the middle of its surface, from the top to the bottom; which operation is called *rabiting*. The outside of the stem is usually marked with a scale, or division of feet, according to its perpendicular height from the keel. The intention of this is to ascertain the draught of water at the fore-part, when the ship is in preparation for a sea-voyage, &c. The stem at its lower end is of equal breadth and thickness with the keel, but it grows proportionally broader and thicker towards its upper extremity. See **SHIP-BUILDING**.

S T E N O G R A P H Y;

Or, SHORT-HAND WRITING.

Plate
ECLXXV.

THE most essential properties of short-hand are expedition and legibility. Any scheme which does not possess a sufficient degree of the first has no title to the name of *Short-hand*; and if the last is wanting, let the method in other respects be what it will, it is good for nothing. The scheme here proposed has a very considerable degree of both, and is also more regular and beautiful than any other.

The characters are all supposed to be written in a

space between two parallel lines. Such letters as are perpendicular or diagonal are intended to fill the whole space; but the natural place of horizontal characters is at the top of the space, except when it is otherwise directed by the following rules.

On Plate CCLXXIV. No 1. you have the letters of the alphabet, and words expressed by them when they stand alone. Thus the first *b* signifies *be* or *by*; the second, *but* or *put*. Horizontal characters, or such as belong

Stegani-
um
||
Stem.

Plate
CCLXXV.

belong to that class, as *d, m, n*, &c. are double; the first standing at the top of the space, as *d*, which then signifies *do* or *doings*; the other *d* is set at the bottom of the space, and stands for *would* or *doing*. *m, n, s*, and *x*, have three places in the space, at the top, in the middle, and at the bottom. Example: *m* at the top is *them*, *me*, *my*, or *am*; the connection will readily distinguish which of these words is meant. The second *k* being a horizontal character, has one place at the top of the space, when it expresses *can*, *come*, or *comings*; and another at the bottom, when it is put for *common* or *commonly*. N. B. The first column contains all the characters used in this short-hand; those in No 4. being no more than natural and obvious contractions of some of them. Where two characters are employed to express one letter, that one is to be chosen occasionally which will make the most easy and natural joining. Beginners will be ready to choose that character which does not join easily; but let not this discourage them, for a little practice will remove this difficulty. The first *l* must always be begun at the bottom; but *r* either at the top or bottom of the space, as occasion may require.

No 2. is a list of prepositions, and No 3. is a list of terminations; of which afterwards. No 4. contains some double and triple consonants, which are contracted according to the rules afterwards laid down.

All unnecessary angles must be avoided in joining the characters, as in No 5. The horizontal *k* must not follow a character drawn upward, nor *x* one that is drawn downward, as in No 6. Many of the letters may be contracted as in No 7. *bn, gm, gn, gr, kr, mv*; and double letters are wrote as in No 8. *bb, dd, kk, mm, nn, ss*. N. B. No letter is to be considered as doubled unless a vowel intervenes; as *mnemon*, write *mnmon*; *babble*, *bbb*; *candid*, *cnnd*. No 9. contains another method of doubling letters, by dividing them with a small stroke behind; as *ff, rr, tt, br, bt, hf, lt, pr, chf*. Consonants may be also doubled by making one of them only half the usual size, as in No 10. *btr, brr, ffr, ffr, ffr, lrr, ltr, ttr, rrr, rrt, rtt, wrr, wrr*.

Letters of the same organ may be changed, for the sake of more easy joining; as *b* for *p*, *f* for *v*, *k* for *g* or *c* hard, *ks* for *x*, *ch* for *sh*, *k* for hard *ch*; and also *t* for *th*, and *vice versa*. This is the reason why our alphabet has no *z*, because *k* or *s* stands for it; and likewise why it has no *s*, because *t* will express it. These exchanges are intended only to take place in the middle and end of words, except *g*; for we may write *kalfy, kite*, for *qualify, quite*; but *k* is always used for hard *c*, *s* for *c* soft, and *s* for *z*. *f* is never wrote for *w*, only for *v*.

No 11. shows the method of joining the letters to one another, and needs no explanation. *b* is always omitted in the middle and end of words; and if a vowel follows, it may be left out even in the beginning, as *Jevva*, or even *Jova*, *unmour* or *unmor*. *y* is never wrote except in the beginning of words; but *beyond, behind*, may be expressed as in No 12. A compound word may be disjoined, as *steel yard*. *t* is sometimes used for *th*, as No 13. *lengthen*. The second *th* is never to be joined to the first *l* or *r* when standing by themselves; but it may be joined to *y* and *g*, as in No 14. *youth, quoth*. At the end of a word *f* or *v* may be joined thus, No 15. *be, to, do, &c.* and *wt what, wn when*; which last is

distinguished from *wad*, which is joined at the bottom of the *w*.

The stroke dividing two letters may sometimes be supplied by the preceding character, as *ffr, kpt*, No 16. but the dividing stroke may frequently be omitted in words of many syllables, as *confutite*; and the same liberty may soon be taken with words that are shorter; *spst* with *r* only half the usual length, may be *spedator*, No 17. As *t* is sometimes used for *th, thr* or *thire* may be wrote as in No 18. *bthr* as in No 19. and *btr* or *better*, as in No 20.

OF SPELLING.—The general rule is, "Spell as you pronounce;" for *chaife, haife*; *laugh, laf*; *draught, draft*; *though, tho*; *debt, det*; *phycic, fyfick*; *schism, ffsm*; *foreign, foren*; *writing, riting*; *high, hi*; *honest, onest*; *psalm, sam*; *friendship, frinsfp*. *g* is dropt in such words as *strength, t* in *setch*; *act, cct, iet*, may be wrote by *k*, and their plurals by *ks*. *t* at the end of a word with *p* before it may be dropt. In general, let the word be as much contracted as possible: after a little practice, the learner will find this very easy, and farther rules will be necessary.

If *p* ends a word, write the second *p*; but if *pf* or *bf*; then use the first *p*; if *bt* or *pt*, use the second *b* as a final character.

OF VOWELS.—They are expressed by a dot in different situations, as in No 21. where *i, m, n*, and *s*, have dots placed both before and after them, to show the different vowels. But as the position of the dots is fully exemplified in No 22. it is unnecessary to give a particular description. When a vowel is to be placed between two consonants, *a, e, i*, follow the first, *o* and *u* go before the last; see No 22.: but advantage may be taken of the place of *i*, so that by changing it different words may be expressed, as *kite, quite*, No 23. When two perpendicular characters are separated by the dividing stroke, *a* and *e* go to the first, *i* in the middle, *o* and *u* to the last part of the character; as No 24. *bat, bet, bit, bot, but*. Diphthongs are to be expressed by the vowel whose sound is most prevalent: as *ai, au, by a; oi by i; ou by o; oo by u*. *w* is never a vowel, for it is always dropt at the end of words.

The following rules show when vowels ought to be expressed, and when not.

In general, no more than one vowel ought to be written in any word, excepting in such words as *idea, ide*. 1st. The initial vowel of a monosyllable must be expressed as in *add, apt, elf, ill*. 2^{dly}. The final vowel (if there is no initial) must be wrote in monosyllables; *few, bow, pay*, write *fiu, bo, pa*. 3^{dly}. No short vowel is to be expressed in any word whatever. 4^{thly}. A long vowel must be wrote in a monosyllable, except in such common words as *both, life, sake*. 5^{thly}. A word of more than one syllable must have its final vowel expressed thus, *aply, empty, concisely, ptly, empy, knisly*. 6^{thly}. A word of more than one syllable must have its long vowel expressed (if it has no final), as *spual* for *spiritual*, *dmir* for *admire*. 7^{thly}. A word of two syllables, having no final nor long vowel, must have its initial vowel wrote, as *akrn* for *acorn*, *img* for *image*. 8^{thly}. If a word have three or more syllables without either long or final vowel, write no vowel at all; thus, *mbleth, embellish*. When the prepositions *in, im*, are followed by *n, m*, the initial vowel must be expressed, *imdsf, immodest, untrl, unnatural*. When the plural

or possessive *s* follows a final vowel, the vowel must not be omitted; as *follicle*, *rallies*, No 25. In writing after a speaker, though you should leave out more vowels than the above rules direct, they may be inserted afterwards when you have more leisure.

OF PREPOSITIONS.—They are always to be wrote separate from the rest of the word. Such as are horizontal may be placed in the middle or at the bottom of the space, but never at the top. The perpendicular and horizontal are made shorter by one-third than their usual length, and are placed at the bottom of the space. No vowel must at any time be joined to a preposition, but must always be prefixed to the following consonant; as *conive*, No 26. If *s* follows a preposition, and is used as a dividing stroke, the preposition may be joined to it; as *insult*, No 29. Such letters as are not employed as prepositions may be made prepositions at large; as *gentleman*, *gentlewoman*, *gingerbread*, *landlord*, No 27. Compound words may be joined or disjoined at pleasure; as *coachman*. In the list of prepositions No 2, the first *n* signifying *anti*, &c. is placed in the middle of the space; and the other, signifying *um*, &c. at the bottom. *s* has three places; when it signifies *fatis*, *super*, it stands at the top of the space, and is the only preposition which has a place at the top.

OF TERMINATIONS.—They may be made the usual size, and may therefore fill the whole space: the termination *ings* is always placed at the top, and *ing* at the bottom. *tion*, in No 3, has five places, according to the vowel which goes before it, as *ation*, *etion*, &c.: but if a consonant goes before it, that consonant is left out, and *tion*, *tion*, is put in the preceding vowel's place; as for *invention*, we write *invetion*; *transfection*, *transfation*; *distinction*, *distiction*; *adoption*, *adotion*; *presumption*, *presution*. Let *tion*, *tion*, be put in the preceding vowel's place, to horizontal as well as perpendicular characters: example, *ascension*, No 30. If one termination follows another, the last must be written at length, as *possibility*; with or without the dividing stroke, *testamentary*, No 31. If a preposition and termination compose the whole of a word, one of them must be wrote at length, whichever the writer pleases. *Comical*, *transfition*, are wrote both ways in No 32. *N. B.* Prepositions and terminations must never be used in writing monosyllables.

Plate CCLXXV. No 33, contains the compound prepositions *concom*, *contradict*, *decom*, No 34. *discom* or *discon*, *disin* or *disinter*, *disfatis*, *incon* or *incon*, *indis* or *undis*, No 35. *insigni*, *inpro*, *insuper* or *unsatis*, *unpro*, *intrans* or *untrans*, No 36. *incircum* or *uncircum*, *incontro* or *uncontro*, *misinter* or *misunder*, *miscom* or *miscon*, *mispre*. No 37. *recom* or *recon*, *repre*, *uninter*, *interpre*, *misinterpre*. The reader will observe, that these compound prepositions are all made up of such as are more simple, and are such as any person would naturally be led to form for his own use; on which account they can be no burden to the memory. *N. B.* In these examples, and every where else, where two or more words are coupled together by the conjunction *or*, there is but one character to express them in the Plate.

No 38, contains examples of prepositions and terminations in their formation of words, *contradict*, *circumstance*, *external*, *recompense*. No 39. *selfishness*, *remember*, *blamable*, *repentition*. No 40. *discontentment*, *un-*

comfortable, *conical*, *omnipotent*. No 41. *Antichrist*, *interpreter*, *undermine*, *contradistinction*. No 42. *competent*, *supereminently*, *magnitude*, *property*. No 43. *transferable*, *withstand*, *discompose*, *disinterested*.

ABBREVIATING RULES. 1st, Such words as are usually abbreviated in long hand may be abbreviated in short: as *Dr*, *Doctor*; *admir*, *administrator*; *e'er*, *ever*; *e'er*, *over*; *e'en*, *even*; *e'entide*, *eventide*; *e'er-take*, *overtake*; *e'ery*, *every*; as in No 44. Poetic contractions may also be used: as *morn*, *morning*; *trump*, *trumpet*; *e'en*, *evening*; No 45. But there are some contractions in long-hand, which are not to be imitated in short: we write *he will*, not *he'll*; *will not*, not *won't*; *cannot*, not *can't*. 2^d, A dot variously applied to a character, so as not to interfere with the vowels places, may be made a mark of abbreviation: thus, if it is placed where the character terminates, it may be the mark of a substantive singular or verb; as *t*, *d*, *s*, and *u*, in No 47. If it is placed at the beginning of the character, it will denote the substantive-plural; as in No 48. The adjective has a mark above the character towards the left-hand; and the participle-perfect a small perpendicular stroke towards the right-hand of the character: both these are exemplified in No 49. The adverb is a dot towards the left-hand below; as in No 50. The participle in *ing* is an oblique stroke, like the third part of our *r*, placed towards the right-hand below, No 51. The participle in *ings*, is the same stroke placed at the top of the space, No 52. In No 53, these marks of abbreviation are illustrated, where *d* with the substantive-dot denotes *advice* or *advise*; with the plural-dot, *advices*; with the participle-perfect dot, *advised*; with the adverb-dot, *advisedly*; with the participle in *ing*, *advising*; its plural *advisings*, and the adjective *advisable*. No 54. exemplifies the same thing with letter *s*; which, with the substantive-mark, signifies *service* or *serve*; and, with the other dots, *services*, *served*, *serviceably*, *serving*, *servings*, *serviceable*: and in No 55. *s* with the substantive or verb mark expresses *triumph*; and, with the other dots, *triumphs*, *triumphed*, *triumphantly*, *triumphing*, *triumphings*, *triumphant*. This use of the dot is only intended to abbreviate such words in a sentence as the connection will readily suggest by this hint; that is, in such cases as, if a person were writing long-hand, he would contract some word in a sentence by writing only the first letter of the word with a dash after it, as a sufficient expression for the word: and in every subject there are some leading words which cannot be mistaken though they are thus contracted, for the connection will immediately decipher them. In following a speaker, it may be sufficient to use the substantive mark only; but if time will permit, it is better to use them all. In order that these marks may be easily applied, let it be observed, that if a word ends in *s*, the substantive-plural mark may be used. If it ends in *ed*, use the participle-perfect mark: if in *ly*, use the adverb mark: if in *ing* or *ings*, use these marks respectively; only *ing* and *ings* are not to be used in writing monosyllables. If a word ends in none of these, use the substantive or adjective mark at pleasure. A list of words may be formed by the help of this mark, and committed to memory; each individual may adapt the list to his own profession, by making choice of such words as frequently occur, and would

be too long if wrote by any other rule. From No 56. to No 61. a lift is given of such words as may suit the divine; the lawyer or physician may easily change these for others more suited to their respective professions. No 56. contains *blss* or *blessing*, *believe* or *belief*, *difficulty*, *doctrine*, *advantage*, *divide* or *division*. No 57. frequent or frequency, *godliness*, *justice*, *glory* or *glorify*, *goodness*, *humanize* or *humanity*. No 58. *covet* or *covetousness*, *consider* or *consideration*, *consequence*, *liberality*, *lament* or *lamentation*, *mortality*, *member*. No 59. *nature*, *engage* or *engagement*, *present* or *presence*, *part*, *qualify* or *qualification*, *repent* or *repentance*, *spirit*. No 60. *sense*, *temper*, *world*, *exemplify* or *example*, *except* or *exception*, *youthfulness*, *cheerfulness*. No 61. *change*, *shame*, *thank*, *charity*, *cheat*, *grace*, *Christian*, *thoughtfulness*. In completing this list, that adjective, adverb, &c. should be chosen which bears the greatest resemblance to the substantive in its consonants. Nos 62. 63. 64. and 65. exemplify the manner of completing the list in the word *divide*. No 62. contains *divide*, *dividing*, *dividing*, *divided*, *divisible*, *divisibly*. No 63. *divider*, *dividend*. No 64. *indivisible*, *undivided*, *individual*, *individuality*. No 65. *divisibility*, *indivisibility*, *indivisibleness*. Where there is no angle at which the dot may be placed, a small line is drawn through the character at the part where the dot should stand, as in *dividend* in No 63. In these examples both prepositions and terminations are applied, which makes the method of carrying this list to a great extent sufficiently plain. 3d. Some words may be abbreviated by writing the preposition with the following consonant and mark of contraction; as, *She ruined her camp*—with *rouge*. *He presents comp*—s, and *thanks for your favours*. *They are so alike that it is difficult to dist*—between them, No 66. 4th. Other words may be contracted by writing the vowel following the consonant, instead of the mark of contraction. As *competition* or *β*, as *circumstance* in No 67. But if the word is plural, the plural mark must not be omitted. 5th. Words of more than one consonant may have their termination expressed by the mark of contraction; as, *reasonableness*, *hardness*, *different*, *fairly*, as in No 68. If the termination of a plural substantive is dropped, the plural mark must be set at the beginning of a word; as *exhortations*, No 69. But the termination must never be omitted if a long vowel goes before it, as *employment*. In many cases the termination is so evident, that no expression need be made for it, as in these examples: *He was very closely engage in business*; *We had entertain them very elegantly*; *They were walk in the fields*. The terminations of the second and third persons of verbs may be always omitted; as, *speak for speakst*, *teach for teacheth*.—6th. Many words may be expressed by their first vowel and consonant following; as in No 70. *Abroad*, *about*, *after*. No 71. *often*, *action*, *according* or *accordingly*, *occasion*. No 72. *Almost*, *always*, *immediately*, *impossible*. No 73. *Into*, *only*, *unto*, *apart*. No 74. *Open*, *acquaint*, *afide*, *these*. No 75. *This*, *those*, *thus*, *utmost*. No 76. *Extremely*, *excessively*. Observe that *these* and *this* are wrote in the middle of the space, *those* and *thus* at the bottom. This list of words, contained in Nos 70, 71, &c. may be increased as the learner improves in the writing; and leading words may be wrote by this rule as well as by the mark of contrac-

tion, always taking care that they be such as the connection will readily discover. Other words may be expressed by their first consonant and vowel following; as in No 77. *Before*, *become*, *hardly*, *likewise*. No 78. *Likely*, *many*, *perpetual* or *perpetually*, *peculiar* or *peculiarly*, *real* or *really* or *reality*. No 79. *Every*, *something*, *sometimes*, *since*. Something is wrote in the middle of the space; *sometimes* and *since* are both placed at the bottom.—7th. The beginnings and endings of some words will be sufficient to express them; as in No 80. *University*, *banishment*, *curiosity*, *arbitrary*: And if the first character is horizontal, it may be placed at the bottom; as in No 81. *University*, *civility*. In these two last numbers *university* is differently expressed; that in No 80. may be put for the word *unity*.—8th. The first consonant and termination of a word may often be a sufficient expression for it; as in No 82. *punishment*.—9th. The first and last consonant may signify a whole word in these cases following. If the characters are both horizontal, place them at the bottom of the space; as, *certain*, *concern*, No 83.: or join them by an angle, as, *doctor*, *master*, No 83.: or join them in an unusual manner; as, *former*, *proper* or *pleasure*, *character*, *harbour*: or, lastly, write them separately the one above the other; as, *between*, *returns*, *retreat*, in No 85. And words wrote by this 9th rule may have any necessary augment joined to them; as, *Returns*, *delivered*, *murdering*, in No 86. Many common words may be abbreviated by writing the first and last consonants, the one above the other: thus, *between*, *former*, *neither*, *unless*, in No 87.; and *perhaps*, *seldom*, *further*, in No 88.—10th. Repetition is to be expressed by placing so many dots at the bottom of the word, to be repeated as there are repetitions of it; thus, *Holy*, *holy*, *holy*, No 89. Or if a whole sentence is repeated, draw a line under the whole repetition, and place dots at the end for as many times as it is repeated. *The temple of the Lord*, *the temple of the Lord*, *the temple of the Lord*, No 90.

These rules ought to be used sparingly at first; as they grow familiar, they may be used more extensively.

No 91. contains characters for figures, distinguished from other characters by a small oblique stroke placed before them. No 92. is an illustration of the joining of such characters, in the various combinations of figures; but if the learner chooses, he may make use of common figures. No 93. shows how dots may be placed for the comma, semicolon, colon, and period; but proportional spaces may be left in the writing instead of them. No 94. are marks of reference, which the reader may vary at his pleasure.

GENERAL SPECIMEN, (Plate CCLXXV.) “How frequently is the honesty and integrity of a man disposed of by a smile or a shrug?—How many good and generous actions have been sunk into oblivion by a distrustful look,—or stamped with the imputation of proceeding from bad motives, by a mysterious and feigning whisper?”

“Look into companies of those whose gentle natures should disarm them,—we shall find no better account.—How large a portion of charity is sent out of the world by distant hints,—nodded away, and cruelly winked into suspicion by the envy or those who are
passed

passed all temptation of it themselves?—How often does the reputation of a helpless creature bleed by a report—which the party who is at the pains to propagate it, beholds with much pity and fellow-feeling,—that she is heartily sorry for it,—hopes in God it is not true? however, as archbishop Tillotson wittily observes upon it, is resolved, in the mean time, to give the report her pangs, that at least it may have fair play to take its fortune in the world—to be believed or not, according to the charity of those into whose hands it shall happen to fall?

“So fruitful is this vice in variety of expedients, to satiate as well as disguise itself. But if these smoother weapons cut so fore—what shall we say of open and unblushing scandal—subjected to no caution—tied down to no restraints? If the one, like an arrow shot in the dark, does nevertheless so much secret mischief—this, like the pestilence which rageth at noon-day, sweeps all before it, levelling without distinction the good and the bad; a thousand fall beside it, and ten thousand on its right hand—they fall—so rent and torn in this tender part of them, so unmercifully butchered, as sometimes never to recover either the wounds or the anguish of heart—which they have occasioned.—

“But there is nothing so bad which will not admit of something to be said in its defence.

“And here it may be asked—Whether the inconveniences and ill effects which the world feels—from the licentiousness of this practice—are not sufficiently counterbalanced by the real influence it has upon mens lives and conduct?—That if there was no evil-speaking in the world, thousands would be encouraged to do ill, and would rush into many indecours, like a horse into the battle, were they sure to escape the tongues of men.

“That if we take a general view of the world—we shall find, that a great deal of virtue—at least of the outward appearance of it, is not so much from any fixed principle, as the terror of what the world will

say, and the liberty it will take upon the occasions we shall give.

“That if we descend to particulars, numbers are every day taking more care to be well spoken of, than what would actually enable them to live so as to deserve it.

“That there are many of both sexes who can support life well enough without honour or chastity, who, without reputation (which is but the opinion which the world has of the matter), would hide their heads in shame, and sink down in utter despair of happiness.

“No doubt the tongue is a weapon which does chastise many indecours which the laws of men will not reach,—and keeps many in awe, whom conscience will not; and where the case is indisputably flagrant, the speaking of it in such words as it deserves, scarce comes within the prohibition.—In many cases it is hard to express ourselves so as to fix a distinction betwixt opposite characters—and sometimes it may be as much a debt we owe to virtue, and as great a piece of justice, to expose a vicious character, and paint it in its proper colours, as it is to speak well of the deserving, and describe his particular virtues. And indeed, when we inflict this punishment upon the bad, merely out of principle, and without indulgences to any private passion of our own—’tis a case which happens so seldom, that one might venture to except it.

“However, to those who in this objection are really concerned for the cause of virtue, I cannot help recommending what would much more effectually serve her interest, and be a sure token of their zeal and attachment to her. And that is—in all such plain instances where it seems to be duty to fix a distinction betwixt the good and the bad—to let their actions speak it instead of their words, or at least to let them both speak one language. We all of us talk so loud against vicious characters, and are so unanimous in our cry against them—that an unexperienced man, who only trusted his ears, would imagine the whole world was in an uproar about it.”

Stenoro-
phonic
||
Stephens.

STENTOROPHONIC TUBE, a speaking-trumpet; thus called from Stentor, a person mentioned by Homer. See ACOUSTICS, n° 26.

STEPHANUS (Byzantines), an able grammarian, who lived in the 5th or 6th century. He wrote a Dictionary, in which he made a great number of observations, borrowed from mythology and history, which showed the origin of cities and colonies, of which we have nothing remaining but a mean abridgment, by Hermolaus the grammarian; but from that work the learned have received great light; and Sigonius, Casaubon, Scaliger, Salmassius, &c. have employed themselves in illustrating it.

STEPHEN, king of England. See ENGLAND, n° 107, &c.

STEPHEN, or *St Stephen's Day*, a festival of the Christian church, observed on the 26th of December, in memory of the first martyr St Stephen.

STEPHENS, the name of a family of printers to whom the world is obliged for the most correct and beautiful editions of the best classic authors, the Greek ones particularly.

HENRY Stephens, the first distinguished person of

S T E

his name, was a Frenchman, and one of the best printers of his time. He died in 1520.

ROBERT Stephens, his second son, was still more eminent in this art than his father. He was born at Paris in 1503; and applied so assiduously to letters in his youth, that he very early acquired a perfect knowledge in the Latin, Greek, and Hebrew tongues. In 1521, the year after his father's death, his mother was married to Simon de Colines, in Latin *Colineus*; who by this means came into the possession of Henry Stephens's printing-house, carried on the business till his death in 1547, and is well known for the neatness and beauty of his Italic character. In 1522, when Robert was 19 years of age, he was charged with the management of his father-in-law's press: and the same year came out, under his inspection, a New Testament in Latin; which gave such offence to the Paris divines, that they threatened to have it burnt and him banished. He appears to have set up for himself soon after, for there are books of his printing so early as 1526. He married Perette, the daughter of Badius, another eminent printer: she was a learned woman, and of great use to her husband in correcting

Stephens.

ting Latin works. He had, besides, in his house ten or twelve correctors of different nations; and nothing but Latin was spoken in his family. In 1539, Francis I. named him his printer; and ordered ancient manuscripts to be fought after for him. The aversion which the doctors of the Sorbonne had conceived against him on account of the Latin New Testament in 1522, revived in 1532, when he printed his great Latin Bible. Francis protected him: but this king dying in 1547, he withdrew to Geneva; where he embraced Calvinism. Here he lived in intimacy with Calvin, Beza, Rivet, and others, whose works he printed; and died in 1559. This eminent artist valued himself so much upon the accuracy of his Latin impressions, that he offered a reward to the discoverer of any fault in them. Robert, like the rest of his family, was not only a printer, but also a writer: his *Theaurus Lingue Latine* is a work of immense learning, and in high repute.

CHARLES Stephens, younger brother of the preceding, wrote and printed many useful and valuable works. He was born about the year 1504, and became perfectly skilled in Greek and Latin literature. He studied physic, and took a doctor's degree at Paris; but this did not hinder him from following the profession of his father, and being printer to the king. He was, however, more eminent as an author than a printer; having written upwards of thirty works upon various subjects. He died at Paris in 1564; leaving behind him a very learned daughter.

HENRY Stephens, eldest son of ROBERT, was born at Paris in 1528, and became the most learned of all his learned family. He was esteemed, after the death of Budæus, the best Greek scholar of his time. It seems to have been about the year 1546 when his father took him into business; yet, before he could think of fixing, he resolved to travel into foreign countries, to examine libraries, and to connect himself with learned men. He went into Italy in 1547, and staid there two years; and returned to Paris in 1549, when he subjoined some Greek verses, made in his youth, to a folio edition of the New Testament in Greek, which his father had just finished. In 1550, he went over to England; and in 1551 to Flanders, where he learned the Spanish tongue of the Spaniards, who then possessed those countries, as he had before learned the Italian in Italy. On his return to Paris, he found his father preparing to leave France: it is not known whether he accompanied him to Geneva; but if he did, it is certain that he returned immediately after to Paris, and set up a printing house. In 1554, he went to Rome, visiting his father at Geneva as he went; and the year after, to Naples. He returned to Paris, by the way of Venice, in 1556. This was upon business, committed to him by the government. Then he settled to printing in good earnest, and gave the world most beautiful and correct editions of all the ancient Greek and other valuable writers. He called himself at first *Printer of Paris*; but, in 1558, took the title of *Printer to Ulric Fugger*, a very rich German, who allowed him a considerable pension. He was at Geneva in 1558, to see his father, who died the year after; and he married in 1560. Henry III. of France was very fond of Stephens, sent him to Switzerland in search of ma-

nuscripts, and gave him a pension. He took him to court, and made him great promises: but the troubles which accompanied the latter part of this king's reign, not only occasioned Stephens to be disappointed, but made his situation in France so dangerous, that he thought it prudent to remove, as his father had done before him, to Geneva. He bestowed great labour and expence on compiling his *Theaurus Lingue Græcæ*, to the impoverishment of his family: for though the work is highly esteemed to this day by the learned, yet these being but few, the demand from them did not reimburse him; and, to add to his misfortune, Scapula his servant treacherously extracted the most useful parts, and published an epitome, which destroyed the sale of the *Theaurus*. He died in 1598; leaving a son, Paul, and two daughters, one of whom had espoused the learned Casaubon in 1586.

PAUL Stephens, the son of Henry, was well skilled in the Greek and Latin tongues. He carried on the business of printing for some time at Geneva: but his press had greatly degenerated from the beauty of that at Paris; and he afterwards sold his types to Chouet, another printer. He died at Geneva in 1627, aged 60 years; leaving a son,

ANTHONY; who, quitting the religion of his father for that of his ancestors, quitted also Geneva, and returned to Paris the place of their original. Here he was some time printer to the king; but managing his affairs ill, he was obliged to give all up, and to have recourse to an hospital, where he died blind in 1674, aged 80.—In him terminated the family of eminent printers, after it had flourished for five generations; and it should be observed, that there were other sons in the three first generations, who followed the art, and acquired great, though inferior, reputation.

STEREOGRAPHIC PROJECTION, is the projection of the circles of the sphere on the plane of some one great circle, the eye being placed in the pole of that circle. See PROJECTION.

STERILITY, the quality of a thing that is barren, in opposition to fertility. It has been asserted by many authors, that all monsters produced by a mixture of different species of animals, such as mules, are barren; but this does not hold universally, even with the mule, which is the instance most generally adduced. See MULE.

Sterility in women sometimes happens from a miscarriage, or violent labour injuring some of the genital parts; but one of the most frequent causes is the suppression of the menstrual flux.—There are other causes, arising from various diseases incident to those parts; by which the uterus may be unfit to receive or retain the male seed;—from the tubæ fallopianæ being too short, or having lost their cretvice power; in either of which cases no conception can take place:—from universal debility and relaxation; or a local debility of the genital system; by which means, the parts having lost their tone or contractile power, the semen is thrown off immediately *post coitum*:—from imperforation of the vagina, the uterus, or the tubæ; or from diseased ovas, &c. Hence medical treatment can only avail in cases arising from topical or universal debility, in correcting irregularities of the menstrual flux, or in removing tumours, cicatrices, or constrictions of the passage, by the art of surgery.

STERLING, (*Sterlingum*), was the epithet for silver money current within this kingdom, and took name from this: That there was a pure coin stamped first in England by the Easterlings, or merchants of East Germany, by the command of king John; and Hoveden writes it *Esterlings*. Instead of the pound sterling, we now say to many pounds of lawful English money: but the word is not wholly disused, for though we ordinarily say lawful money of England, yet in the mint they call it *Sterling money*; which is meant to denote the certain degree of fineness which ought to be retained in the respective coins.

STERN, the posterior face of a ship; or that part which is represented to the view of a spectator, placed on the continuation of the keel behind, as exhibited in Plate CCLXXVII. fig. 1, 2, 3, 4.

The stern, fig. 1. is terminated above by the taffarel, and below by the counters: It is limited on the sides by the quarter-pieces; and the intermediate space comprehends the galleries and windows of the different cabins.

This figure exhibits the stern of a 74-gun ship.

A, the keel, with *a* the false keel beneath it.

AB, the stern-post.

C, the rail which determines the height of the counters.

DD, the upper and lower quarter-galleries, with their balustrades and windows.

E, the quarter-pieces: and PFP, the taffarel.

KGK, the lower counter, with HH, its gun-ports.

G, the rail which separates the lower counter from the second or upper counter; which last is included between G and C.

KK, the wing-transom.

LL, the deck-transom.

M, N, O, first, second, and third transoms; the 4th, 5th, and 6th transoms are placed immediately under these: and that which lies between the wing and deck-transoms, is called the *filling transom*.

OMLK P, the direction of the fashion-piece, whose upper part is expressed by the dotted lines KP.

Q, the cove, a sort of arched canopy, serving as a roof to the stern-gallery.

RQR, the screen bulk-head, or partition, containing the cabin-windows.

RSSR, the balustrade of the stern-gallery, with SS, the foot-pace-rail, which determines the height of its floor, or platform.

SCS, the ward-room windows.

T, the lower finishing of the quarter gallery.

Fig. 2. exhibits a stern-view of a 60 gun ship, with the curve of the frame-timbers on one side, and the disposition of all the planks of the bottom on the other side.

Fig. 3. represents a stern view of a French man of war of 70 guns.

Fig. 4. is a stern for a first or second rate: accordingly it is furnished with a middle apartment between the ward-room and the captain's cabin. This apartment is also furnished with galleries on the stern and quarter. The other parts of it are described in the explanation of fig. 1. See also the article **QUARTER**.

Stern-Fast, a rope used to confine the stern of a ship or boat to any wharf or jetty-head, &c.

Stern-Post, a long straight piece of timber erected

on the extremity of the keel, to sustain the rudder and terminate the ship behind.

This piece, which is expressed by B in the pieces of the hull, Plate CCLXV. fig. 3. ought to be well secured and supported; because the ends of all the lower planks of the ship's bottom are fixed in a channel, cut on its surface; and the whole weight of the rudder is sustained by it.

The dimensions of the stern-post, or the proportional breadth and thickness in the different parts of its height, are geometrically delineated in the quarter and stern of a 74 gun ship, Plate CCLIV. fig. 1. and CCLXXVII. fig. 1. being expressed in both by AB. It is usually marked like the stern, with a scale of feet from the keel upwards, in order to ascertain the draught of water at that part of the vessel.

The difficulty of procuring a stern-post of sufficient breadth in one piece, has introduced the practice of fixing an additional piece behind it, which is strongly bolted to the former. The hinges, which support the rudder, are accordingly fixed to this latter, which is also tenanted into the keel, and denominated the *back of the post*. It is half the breadth of the stern-post at the keel, but diminishes gradually towards the upper end, where it is one-third narrower.

The stern-post is strongly attached to the keel by a knee, G, Plate CCLXV. fig. 3. of which one branch extends along the keel, being scarfed and bolted to the dead-wood, and fore-locked under the keel; whilst the other branch inclines upwards, and corresponds with the inside, or fore-part of the stern-post; to which it is also bolted in the same manner.

Stern-Sheets, that part of a boat which is contained between the stern and the aftmost, or hindmost, seat of the rowers. It is generally furnished with benches to accommodate the passengers. See **BOAT**.

STERNA, a genus of birds, of the order of anseres. There are seven species, three of which are British, viz. 1. The *hirundo*, or great tern, weighs four ounces one-quarter: the length is fourteen inches; the breadth thirty: the bill and feet are of a fine crimson; the former tipped with black, straight, slender, and sharp-pointed: the crown, and hind part of the head, black: the throat, and whole under-side of the body, white: the upper part, and the coverts of the wings, a fine pale grey: the tail consists of twelve feathers; the exterior edges of the three outmost are grey, the rest white: the exterior, on each side, is two inches longer than the others: in flying, the bird frequently closes them together, so as to make them appear one slender feather. These birds frequent the sea-shores, banks of lakes and rivers: they feed on small fish, and water-insects; hovering over the water, and suddenly darting into it, catch up their prey. They breed among small tufts of rushes; and lay three or four eggs, of a dull olive colour, spotted with black. All the birds of this genus are very clamorous.

2. The lesser tern, called by Linnaeus *larus minutus*, weighs only two ounces five grains; length eight inches and a half; the breadth nineteen and a half. The bill is yellow, tipped with black: the forehead and cheeks white: from the eyes to the bill is a black line: the top of the head and hind part black: the breast, and under side of the body clothed with feathers so closely set together, and of such an exquisite rich gloss, and so fine a white, that

STERN.

Sterno
||
Stetin.

that no fatin can be compared to it: the back and wings of a pale grey: the tail short, less forked than that of the former, and white: the legs yellow: the irides dusky.—These two species are very delicate, and seem unable to bear the inclemency of the weather on our shores during winter; for we observe they quit their breeding places at the approach of it, and do not return till spring. The manners, haunts and food of this are the same with those of the former; but these are far less numerous.

3. The stilpice, or black tern, is of a middle size between the first and second species. The usual length is ten inches; the breadth twenty-four; the weight two ounces and a half. The head, neck, breast, and belly, as far as the vent, are black; beyond is white: the male has a white spot under its chin: the back and wings are of a deep ash-colour: the tail is short and forked; the exterior feather on each side is white; the others ash-coloured: the legs and feet of a dusky red. Mr Ray calls this a *clown-footed gull*; as the webs are depressed in the middle, and form a crescent. These birds frequent fresh waters; breed on their banks, and lay three small eggs of a deep olive-colour, much spotted with black. They are found during spring and summer in vast numbers in the Fens of Lincolnshire; make an incessant noise, and feed as well on flies as water-insects and small fish. Birds of this species are seen very remote from land. Kalm saw flocks of hundreds in the Atlantic Ocean, midway between England and America; and a later voyager saw one 240 leagues from the Lizard, in the same ocean.

STERNO-HYOIDEUS, in anatomy. See there, *Table of the Muscles*.

STERNUM, in anatomy. See there, n° 36.

STERNUTATIVE, or STERNUTATORY, a medicine proper to produce sneezing. Sternutatives are of two kinds, gentle and violent. Of the first kind are betony, sage, marjoram, tobacco, and the whole fashionable tribe of snuffs. Of the latter kind are euphorbium, white hellebore, pellitory, &c. Sternutatives operate by their sharp pungent parts vellicating the inner membrane of the nose, which is exceeding sensible, and occasioning the serous matter contained in the glands of the nose, and in several sinuses situated in the base of the cranium and of the os frontis, to be expelled.

STETIN, or STETTIN, a sea-port town of Germany, in the circle of Upper Saxony, and capital of Hither Pomerania, with the title of a duchy, and a cattle. It had long a famous school, which the wars of Germany never disturbed. The ancient dukes of Pomerania resided here; and it was taken by the elector of Brandenburg in 1676, but given to Sweden by the treaty of Nimeguen. In 1713, it submitted to the allies; and then the said elector was put in possession again of this important place, which is a bulwark to the Marche of Brandenburg: and the fortifications have been greatly improved. It is now a flourishing place, and carries on a considerable trade. It is seated on the river Oder, 80 miles north of Francfort, and 70 north by east of Berlin. E. Lon. 14. 58. N. Lat. 53. 27. The duchy is 125 miles in length; and borders upon Mecklenburg, and partly upon Brandenburg. The breadth is from 17 to 25 miles, and it is

divided by the river Oder into two parts.

STEW, a small kind of fish-pond, the peculiar office of which is to maintain fish, and keep them in readiness for the daily use of the family, &c.

STREWS, (from the French *flaves*, i. e. *therme, balneum*), are those places which were permitted in England to women of professed incontinency, and that for hire would prostitute their bodies to all comers; so called, because dissolute persons are wont to prepare themselves for venereous acts by bathing; and hot baths were by Homer reckoned among the effeminate sort of pleasures. These stews were suppressed by King Henry VIII. about the year 1546.

STEWARD, (*senescallus*, compounded of the Saxon *steda*, i. e. "room;" or *stead* and *weard*, "a ward" or "keeper,") an officer appointed in another's stead or place, and always taken for a principal officer within his jurisdiction. Of these there are various kinds. The greatest officer under the crown is the lord high-steward of England, an office that was anciently the inheritance of the earls of Leicester, till forfeited by Simon de Mountfort to king Henry III. But the power of this officer is so very great, that it has not been judged safe to trust it any longer in the hands of a subject, excepting only *pro hac vice*, occasionally: as to officiate at a coronation, at the arraignment of a nobleman for high-treason, or the like. During his office, the steward bears a white staff in his hand; and the trial, &c. ended, he breaks the staff, and with it his commission expires. There is likewise a lord-steward of the king's household, who is the chief officer of the king's court, has the care of the king's house, and authority over all the officers and servants of the household, except such as belong to the chapel, chamber, and stable.

STEWARD, an officer in a ship of war, appointed by the purser to distribute the different species of provisions to the officers and crew; for which purpose he is furnished with a mate and proper assistants.

Court of the Lord High STEWARD of Great Britain, is a court instituted for the trial of peers indicted for treason or felony, or for misprison of either. The office of this great magistrate is very ancient, and was formerly hereditary, or at least held for life, or *dum bene se gesserit*: but now it is usually, and hath been for many centuries past, granted *pro hac vice* only; and it hath been the constant practice (and therefore seems now to have become necessary) to grant it to a lord of parliament, else he is incapable to try such delinquent peer. When such an indictment is therefore found by a grand jury of freeholders in the King's bench, or at the assizes before the justices of *oyer and terminer*, it is to be removed by a writ of *certiorari* into the court of the lord high-steward, which has the only power to determine it. A peer may plead a pardon before the court of King's bench, and the judges have power to allow it, in order to prevent the trouble of appointing an high-steward merely for the purpose of receiving such plea: but he may not plead in that inferior court any other plea, as guilty or not guilty of the indictment, but only in this court; because, in consequence of such plea, it is possible that judgment of death might be awarded against him. The king, therefore, in case a peer be indicted of treason, felony,

Stew
||
Steward.

Steward.

lony, or misprision, creates a lord high-steward *pro hac vice* by commission under the great seal; which recites the indictment so found, and gives his Grace power to receive and try it *secundum legem et consuetudinem Angliæ*. Then when the indictment is regularly removed by writ of *certiorari*, commanding the inferior court to certify it up to him, the lord high-steward directs a precept to a serjeant at arms, to summon the lords to attend and try the indicted peer. This precept was formerly issued to summon only 18 or 20 selected from the body of the peers; then the number came to be indefinite; and the custom was for the lord high-steward to summon as many as he thought proper, (but of late years not less than 23), and that those lords only should sit upon the trial; which threw a monstrous weight of power into the hands of the crown, and this its great officer, of selecting only such peers as the then predominant party should most approve of. And accordingly, when the earl of Clarendon fell into disgrace with Charles II. there was a design formed to prorogue the parliament, in order to try him by a select number of peers; it being doubted whether the whole house could be induced to fall in with the views of the court. But now, by statute 7 W. III. c. 3. upon all trials of peers for treason or misprision, all the peers who have a right to sit and vote in parliament shall be summoned at least 20 days before such trial, to appear and vote therein; and every lord appearing shall vote in the trial of such peer, first taking the oaths of allegiance and supremacy, and subscribing the declaration against popery.

During the session of parliament, the trial of an indicted peer is not properly in the court of the lord high-steward, but before the court last mentioned of our lord the king in parliament. It is true, a lord high-steward is always appointed in that case to regulate and add weight to the proceedings: but he is rather in the nature of a speaker *pro tempore*, or chairman of the court, than the judge of it; for the collective body of the peers are therein the judges both of law and fact, and the high-steward has a vote with the rest in right of his peerage. But in the court of the lord high-steward, which is held in the recess of parliament, he is the sole judge of matters of law, as the lords triors are in matters of fact; and as they may not interfere with him in regulating the proceedings of the court, so he has no right to intermix with them in giving any vote upon the trial. Therefore, upon the conviction and attainder of a peer for murder in full parliament, it hath been holden by the judges, that in case the day appointed in the judgment for execution should lapse before execution done, a new time of execution may be appointed by either the high court of parliament during its sitting, though no high-steward be existing, or, in the recess of parliament, by the court of king's-bench, the record being removed into that court.

It has been a point of some controversy, whether the bishops have now a right to sit in the court of the lord high-steward to try indictments of treason and misprision. Some incline to imagine them included under the general words of the statute of king William, "all peers who have a right to sit and vote in parliament:" but the expression had been much clear-

er, if it had been "all lords," and not "all peers;" for though bishops, on account of the baronies annexed to their bishoprics, are clearly lords of parliament, yet their blood not being ennobled, they are not universally allowed to be peers with the temporal nobility: and perhaps this word might be inserted purposely with a view to exclude them. However, there is no instance of their sitting on trials for capital offences, even upon impeachments or indictments in full parliament, much less in the court we are now treating of; for indeed they usually withdraw voluntarily, but enter a protest, declaring their right to stay. It is observable, that, in the 11th chapter of the constitutions of Clarendon, made in parliament 11th Hen. II. they are expressly excused, rather than excluded, from sitting and voting in trials, when they come to concern life or limb: *episcopi, sicut ceteri barones, debent interesse iudicii cum baronibus, quousque perveniantur ad diminutionem membrorum, vel ad mortem*. And Becket's quarrel with the king hereupon was not on account of the exception, (which was agreeable to the canon law), but of the general rule, that compelled the bishops to attend at all. And the determination of the house of lords in the earl of Danby's case, which hath ever since been adhered to, is consonant to these constitutions; "that the lords spiritual have a right to stay and sit in court in capital cases, till the court proceeds to the vote of guilty or not guilty." It must be noted, that this resolution extends only to trials in full parliament; for to the court of the lord high-steward (in which no vote can be given, but merely that of guilty or not guilty) no bishop, as such, ever was or could be summoned: and though the statute of king William regulates the proceedings in that court, as well as in the court of parliament, yet it never intended to new-model or alter its constitution; and consequently does not give the lords spiritual any right, in cases of blood, which they had not before. And what makes their exclusion more reasonable is, that they have no right to be tried themselves in the court of the lord high-steward, and therefore surely ought not to be judges there. For the privilege of being thus tried depends upon nobility of blood rather than a seat in the house, as appears from the trials of popish lords, of lords under age, and (since the Union) of the Scots nobility, though not in the number of the sixteen; and from the trials of females, such as the queen consort or dowager, and of all peeresses by birth; and peeresses by marriage also, unless they have, when dowagers, disparaged themselves by taking a commoner to their second husband.

STEWART in Scots law. See LAW, N^o clviii. 5.

STIBIUM, a name for ANTIMONY.

STIGMA, a brand, or impression with a hot iron; a mark of infamy. See STIGMATIZING.

STIGMA, in botany, the summit or top of the style, accounted by the sexualists the female organ of generation in plants, which receives the fecundating dust of the tops of the stamina, and transmits its vapour or effluvia through the style into the heart of the seed-bud, for the purpose of impregnating the seeds.

STIGMATA, the apertures in different parts of the bodies of insects, communicating with the tracheæ or air-vessels, and serving for the office of respiration.

Steward

Stigmata.

Stigmata
Stillingfleet.

STIGMATA, in antiquity, certain marks impressed on the left shoulders of the soldiers when lifted.

STIGMATIZING, among the ancients, was inflicted upon slaves as a punishment, but more frequently as a mark to know them by: in which case, it was done by applying a red-hot iron marked with certain letters to their foreheads, till a fair impression was made; and then pouring ink into their furrows, that the inscription might be the more conspicuous. Stigmatizing, among some nations, was, however, looked upon as a distinguishing mark of honour and nobility.

STILE. See STYLE.

STILL-BOTTOMS, in the distillery, a name given by the traders to what remains in the still after working the wash into low wines. These bottoms are procured in the greatest quantity from the malt-wash, and are of so much value to the distiller in the fattening of hogs, &c. that he often finds them one of the most valuable articles of the business.

STILLINGFLEET (Edward), bishop of Worcester, was the son of Samuel Stillingfleet gentleman, and was born at Cranborn in Dorsetshire in 1635. He was educated at St John's College, Cambridge; and having received holy orders, was, in 1657, presented to the rectory of Sutton in Nottinghamshire. By publishing his *Origines Sacrae*, and other works, he soon acquired such reputation, that he was appointed preacher of the Rolls Chapel; and in January 1665 was presented to the rectory of St Andrew's, Holborn. He was afterwards chosen lecturer at the Temple, and appointed chaplain in ordinary to king Charles II. In 1668, he took the degree of doctor of divinity; and was soon after engaged in a dispute with those of the Romish religion, by publishing his discourse concerning the idolatry and fanaticism of the church of Rome, which he afterwards defended against several antagonists. In 1680 he preached at Guildhall chapel a sermon on Phil. iii. 16. which he published under the title of *The Mischief of Separation*; and this being immediately attacked by several writers, he in 1683 published his *Unreasonableness of Separation*. In 1685 appeared his *Origines Britannicae*, or the Antiquities of the British Church, in folio. During the reign of king James II. he wrote several tracts against popery, and was prolocutor of the convocation, as he had likewise been under king Cha. II. After the Revolution he was advanced to the bishopric of Worcester, and was engaged in a dispute with the Socinians, and also with Mr Locke; in which last contest he is generally thought to have been unsuccessful. He died at Westminster in 1699, and was interred in the cathedral of Worcester, where a monument was erected to his memory by his son. Dr Stillingfleet wrote other works besides those here mentioned, which, with the above, have been reprinted in 6 vols. folio.

STILLINGFLEET (Benjamin), an ingenious naturalist, was grandson of the preceding. His father Edward was fellow of St John's College in Cambridge, F. R. S. M. D. and Gresham professor of physic: but marrying in 1692, he lost his lucrative offices and his father's favour; a misfortune that affected both himself and his posterity. However, going into orders, he obtained, by his father's means, the living of Newton-Butts, which he immediately exchanged for

thofe of Wood-Norton and Swanton in Norfolk. He died in 1708.

Benjamin, his only son, was educated at Norwich school; which he left in 1720, with the character of an excellent scholar. He then went to Trinity-College in Cambridge, at the request of Dr Bentley, the master, who had been private tutor to his father, domestic chaplain to his grandfather, and much indebted to the family. Here he was a candidate for a fellowship, but was rejected by the master's influence. This was a severe and unexpected disappointment, and but little alleviated afterwards by the Doctor's apology, that it was a pity that a gentleman of Mr Stillingfleet's parts should be buried within the walls of a college.

Perhaps, however, this ingratitude of Dr Bentley was not of any real difference to Mr Stillingfleet. By being thrown into the world, he formed many honourable and valuable connections. He dedicated some translations of Linnæus to the late lord Lyttelton, partly, he says, from motives of private respect and honour. The present lord Barrington gave him, in a very polite manner, the place of the master of the barracks at Kensington; a favour to which Mr Stillingfleet, in the dedication of his Calendar of Flora to that nobleman, alludes with equal politeness, as well as with the warmest gratitude. His Calendar of Flora was formed at Stratton in Norfolk in the year 1755, at the hospitable feat of his very worthy and ingenious friend Mr Marham, who had made several observations of that kind, and had communicated to the public his curious observations on the growth of trees. But it was to Mr Wyndham of Felbrig in Norfolk that he appears to have had the greatest obligations; he travelled abroad with him, spent much of his time at his house, and was appointed one of his executors (Mr Garrick was another), with a considerable addition to an annuity which that gentleman had settled upon him in his lifetime.

Mr Stillingfleet's genius seems, if we may judge from his works, to have led him principally to the study of natural history; which he prosecuted as an ingenious philosopher, an useful citizen, and a good man. In this walk of learning he mentions, as his friends, Dr Watson, Mr (now Dr) Solander, Mr Hudson, Mr Price of Foxley, and some others; to whom may be added the ingenious Mr Pennant. Nor can we omit the flattering mention which the late Mr Gray makes of him in one of his letters, dated from London in 1761: "I have lately made an acquaintance with this philosopher, who lives in a garret here in the winter, that he may support some near relations who depend upon him. He is always employed, consequently (according to my old maxim) always happy, always cheerful, and seems to me a very worthy honest man. His present scheme is to send some persons, properly qualified, to reside a year or two in Attica, to make themselves acquainted with the climate, productions, and natural history of the country, that we may understand Aristotle, Theophrastus, &c. who have been Heathen Greek to us for so many ages; and this he has got proposed to lord Bute, no unlikely person to put it in execution, as he is himself a botanist."

Mr Stillingfleet published a volume of miscellaneous tracts, which is in much esteem, and does
great

stimulating great honour to his head and heart. They are chiefly translations of some essays in the *Amnitates Academicæ*, published by Linnæus, interperfed with some observations and additions of his own. In this volume he shows alfo a taste for claffical learning, and entertains us with fome elegant poetical effufions of his own. But his Essay on Conversation, published in the first volume of Dodfley's Collection of Poems, entitles him to a diftinguished rank among our English poets. This poem is addreffed to Mr Wyndham, with all that warmth of friendship which diftinguishes Mr Stillingfleet. As it is chiefly didactic, it does not admit of fo many ornaments as fome compositions of other kinds. However, it contains much good fenfe, shows a considerable knowledge of mankind, and has feveral passages that in point of harmony and eafy verification would not difgrace the writings of our moft admired poets. Here more than once Mr Stillingfleet shows himfelf ftill fore for Dr Bentley's cruel treatment of him; and towards the beautiful and moral clofe of it (where it is fuppofed he gives us a sketch of himfelf), feems to hint at a mortification of a more delicate nature, which he is faid to have fuffered from the other fex.

Stipulation.

To thefe difappointments it was perhaps owing that Mr Stillingfleet neither married nor went into orders. His London refidence was at a fadler's in Piccadilly; where he died in 1771, aged above 70, leaving feveral valuable papers behind him. He was buried in St James's church, without the flightest monument of his having exifted.

STIMULATING, a property in bodies by which they vellicate, and caufe vibrations and inflections of the fibres of the nerves, and a greater derivation of nervous fluid into the parts affected. Stimulants produce pain, heat, rednefs, &c.

STIMULI, in botany, a species of armature or offensive weapon, with which fome plants, as nettle, caffada, acalypha, and tragia, are furnished. Their ufe, fays Linnæus, is by their venomous punctures to keep off naked animals that would approach to hurt them.

STING, an apparatus in the bodies of certain insects, in form of a little fpear, ferving them as a weapon of offence.

STING-Ray, in ichthyology. See **RAYA**.

STINK-POT, an earthen jar or fhell, charged with powder, grenades, and other materials of an offensive and fuffocating fmell. It is frequently ufed by privateers, in the western ocean, in the attack of an enemy whom he defigns to board; for which purpose it is furnished with a lighted fufe, at the opening or touch-hole. See **BOARDING**.

STIPEND, among the Romans, fignifies the fame with tribute; and hence *stipendarii* were the fame with *tributarii*.

STIPEND, in Scots law. See **LAW**, N^o cliv. 12, 13.

STIPULA, in botany, one of the fulcra or props of plants, defined by Linnæus to be a fcale, or fmall leaf, flationed on each fide the bafe of the foot-ftalks of the flower and leaves, at their first appearance, for the purpose of fupport. Elmgren reftricts it to the foot-ftalks of the leaves only.

STIPULATION, in the civil law, the act of stipulating, that is, of treating and concluding terms

and conditions to be inserted in a contract. Stipulations were anciently performed at Rome, with abundance of ceremonies; the first whereof was, that one party should interrogate, and the other answer, to give his confent, and oblige himfelf. By the ancient Roman law, nobody could stipulate but for himfelf; but as the Tabelliones were public fervants, they were allowed to stipulate for their mafers; and the notaries fucceeding the Tabelliones, have inherited the fame privilege.

STIRIA, a province of Germany, in the circle of Aultria, with the title of a duchy. It is bounded on the north by the archduchy of Aultria, on the east by Hungary, on the fouth by Carniola, and on the west by Carinthia and the archbifhopric of Saltzburg; being 125 miles in length, and 17 in breadth. It is faid to contain 22 cities, 95 towns, 338-castles, 15 convents, and 200,000 inhabitants. Though it is a mountainous country, yet there is a great deal of land fit for tillage, and the foil is fo good, that the inhabitants never were in want of corn. It contains mines of very good iron; whence the arms made here are in great efteem. The women differ greatly from the Aultrians, and are very plain and downright. They have all fwellings on their throats, called *bronchoceler*. The men are alfo very fimple, and are very zealous worshippers of the Virgin Mary. They delight to fit at home in the chimney-corner, never troubling their heads about foreign affairs. The chief town is Graz.

STIRLING, a town of Scotland, fituated on the river Forth, thirty miles north-west of Edinburgh, in W. Long. 3. 50. N. Lat. 56. 12. It is alfo called *Sterling*, and *Striveling*; from the former of which Boethius faifely derives the name *Sterling money*; becaufe, fays he, Olseit, a Saxon prince, after the overthrow of the Scots, eftablished here a mint. The name of *Striveling* is faid to have been derived from the frequency of ftrifes or conflicts in the neighbourhood. The town contains about 4000 inhabitants. It has a manufacture of tartans and fhalleons, and employs about 30 looms in that of carpets. The great ftreet is very broad. In it is the tolbooth, where is kept the standard for the wet meafures of Scotland. The other ftreets are narrow and irregular.—Stirling is in miniature a re-femblance of Edinburgh; being built on a rock of the fame form, with a fortrefs on the fummit. The origin of the caftle is unknown. The rock of Stirling was ftrongly fortified by the Picts, amongst whom architecture and feveral other ufeul arts had made a considerable progrefs. As it lay in the extremities of their kingdom, the poffeffion of it was the occafion of frequent contentts betwixt them and their neighbours the Scots and Northumbrians; each of whose dominions did, for fome time, terminate near it.

When the Scots, under Kenneth II. overthrew the Pictish empire near the middle of the ninth century, they endeavoured to obliterate every memorial of that people. They not only gave new names to provinces and towns, but, with all the rage of barbarians, demolished many magnificent and ufeul edifices which had been reared up by them, and this fortrefs among the reft. It was, however, foon rebuilt, though upon an occafion not very honourable to the Scots.

Upon the death of Kenneth II. in 855, his brother Donald V. mounted the throne of Scotland. In the begin-

Stiria,
Stirling.

Stirling.

beginning of his reign the kingdom was invaded by Obrecht and Ella, two Northumbrian princes, who, uniting their forces with the Cumbrian Britons, and a number of Picts, who upon their expulsion from their native country had taken refuge in England, advanced to Jedburgh, where Donald encountered them; and, after a fierce and bloody battle, obtained a complete victory: but, having taken up his station in Berwick, in supine security, the Northumbrians, informed of the careless posture in which the Scottish army lay, surprised them by a hasty march, dispersed them, and made a prisoner of the king. Pursuing the advantage they had gained, they marched northward, and subdued all before them to the Frith of Forth and the town of Stirling. But the forlorn situation of the Scots, without a king and without an army, obliging them to sue for peace, they obtained it, upon condition that they should pay a sum of money for the ransom of the king, and yield up all their dominions upon the south side of the Forth to the conquerors.

The Northumbrians taking possession of the territories ceded to them by this treaty, rebuilt the castle of Stirling, and planted it with a strong garrison, in order to preserve their new conquests, upon the frontiers of which it was situated. Our authorities also inform us, that they erected a stone-bridge over the Forth, upon the summit of which a cross was raised, with the following inscription in monkish rhyme.

*Anglos a Scottis separat crux ista remotis;
Armis hic stant Bruti, Scotti stant hic, cruce tuti.*

Which is thus translated by Bellenden.

I am free marche, as passengeris may ken,
To Scottis, to Britonis, and to Inglismen.

None of the ancient English historians mention this conquest. The whole story, as well as the inscription, wears much of a monkish garb; yet its authenticity is not a little confirmed by the arms of the town of Stirling, upon which is a bridge, with a cross, and the last line of the above Latin distich is the motto around it.

We must not, however, imagine, that in those times that fortrefs bore any resemblance to the present structure, which is adapted to the use of fire-arms. Its size and form probably resembled those castles which, under the feudal constitution, the English and Scottish barons used to erect upon their estates for dwelling-houses; and which, in those barbarous ages, they found necessary to fortify for their defence, not only against foreign invaders, but often against the attacks of their own neighbours. It is directly such a Gothic figure as this which represents the *Castrum Strivelense* upon the arms of Stirling.

This fortrefs, after it had continued in the possession of the Northumbrian Saxons about 20 years, was, together with the whole country upon the south side of the Forth, restored to the Scots, upon condition of their assisting the Saxons against their turbulent invaders the Danes. Upon the arms of Stirling are two branches of a tree, to represent the *Nemus Strivelense*; but the situation and boundaries of that forest, which was probably a wing of the Caledonian, cannot be ascertained. Upon the south of Stirling, vestiges of a forest are still discernible for several miles. Banks of natural timber still remain in the castle-park, at

Murray's wood, and near Nether Bannockburn; and stumps of trees, with much brushwood, are to be seen in all the adjacent fields.

When Kenneth III. received intelligence of the Danes having invaded his dominions, he appointed the castle of Stirling to be the place of rendezvous for his army; and he marched from thence to the battle of Luncarty, where he obtained a victory over those rovers, in the end of the 10th century.

In the 12th century, this castle is spoken of as a place of great importance, and one of the strongest fortresses in the kingdom. In 1174, a calamity, not unusual amongst the Scottish monarchs, befel William, who at that time occupied the throne. He was taken prisoner in an unsuccessful expedition which he made into England; and, after having been detained 12 months in captivity, was released, upon stipulating to pay a large sum of money for his ransom; and, until payment thereof, delivering into the hands of the English the four principal fortresses in the kingdom, which in those days were Stirling, Edinburgh, Roxburgh, and Berwick. This was the first great ascendant that England obtained over Scotland; and indeed, the most important transaction which had passed between these kingdoms since the Norman conquest.

Though the Scottish monarchs, in their frequent perambulations thro' the kingdom, often visited Stirling, and held their courts for some time in the castle; yet it did not become a royal residence till the family of Stuart mounted the throne, and it was from different princes of this family that it received its present form. It was the place of the nativity of James II.; and, when raised to the throne, he frequently kept his court in it. It is well known to have been the place where that prince perpetrated an atrocious deed, the murder of William earl of Douglas, whom he stabbed with his own hand. The royal apartments were at that time in the north-west corner of the castle, and are now the residence of the major. The room where the murder was committed still goes by the name of *Douglas's room*. See SCOTLAND, n^o 304, 305.

James III. contracting a fondness for the castle on account of its pleasant situation, made it the chief place of his residence, and added several embellishments to it. He built within it a magnificent hall, which in those days was deemed a noble structure, and is still entire. It now goes by the name of the *parliament house*, having been designed for the accommodation of that supreme court. It is covered with an oak-roof of exquisite workmanship, which is very little decayed, though it hath stood near 300 years. James also erected a college of secular priests in the castle, which he called the *chapel-royal*, and which proved one cause of his own ruin. As the expences necessary for maintaining the numerous officers of such an institution were considerable, he annexed to it the revenues of the rich priory of Coldingham in the Merse, which at that time happened to become vacant. This priory had for a long time been holden by persons connected with the family of Hume; and that family, considering it as belonging to them, strongly opposed the annexation. The dispute seems to have lasted several years; for one parliament had passed a vote, annexing the priory to the chapel-royal, and a subsequent one enacted a statute prohibiting

Stirling.

every.

Stirling. every attempt that was contrary or prejudicial to that annexation.

James V. was crowned in the castle of Stirling; and the palace, which is the chief ornament of it, was the work of that prince. This is a stately and commodious structure, all of hewn stone, with much statuary work upon it. It is built in form of a square, with a small court in the middle, in which the king's lions are said to have been kept; and hence it still goes by the name of the *lions den*. The palace contains many large and elegant apartments; the ground-story is now converted into barrack-rooms for the soldiers of the garrison; the upper affords a house for the governor, with lodgings for some of the subaltern officers.

Opposite to the palace, upon the north, stands an elegant chapel, which was built by James VI. for the baptism of his son prince Henry in 1594. In this chapel is preserved the hull of a large boat, which that whimsical monarch caused to be built and placed upon carriages, in order to convey into the castle the provisions for that solemnity.

A strong battery, with a tier of guns pointing to the bridge over the Forth, was erected during the reignty of Mary of Lorraine, mother to queen Mary. It is called the *French battery*, probably because constructed by engineers of that nation. The last addition was made to the fortifications in the reign of queen Anne. Formerly they reached no farther than the old gate, upon which the flag-staff now stands; but in that reign they were considerably enlarged upon the side towards the town; and barracks, which are bomb-proof, with several other conveniences for a siege, were erected.

Upon the south-west of the castle lies a large park inclosed with a stone-wall, called the *king's park*, where the court used to divert themselves with hunting of the deer which were kept in it. At the east end of the park lay the royal gardens; vestiges of the walks and parterres, with a few stumps of fruit-trees, are still visible; but by long neglect, and the natural wetness of the soil, the place is now little better than a marsh. In the gardens is a mount of earth in form of a table, with benches of earth around it, where, according to tradition, the court sometimes held *fetes champêtres*. In the castle-hill is an hollow, comprehending about an acre of ground, and having all the appearance of an artificial work, which was used for joustings, tournaments, and other feats of chivalry.

Northward of the castle lies the Govan-hill; in the middle of which is a small mount called *Hurly Haaky*, upon which duke Murdoch and his two sons were executed for treasonable practices in the reign of James I.

The prospect from the castle is most delightful as well as extensive, being greatly beautified, especially upon the east, by the windings of the Forth; which are so many, that though the distance by land, from the bridge of Stirling to Alloa, is only four miles, it is said to be 24 by water. As this river generally runs upon plain ground, it rolls its stream in so slow and silent a manner, that what Silius Italicus saith of the Ticinus is applicable to it, if, instead of *lucenti* in that poet, we should for once read *luteo*; for the clay-banks, together with the tide, which flows above Stirling, render the Forth perpetually muddy:

*Vix credas labi, ripis tam mitis apaci
Sonniferam ducit luteo gurgite lympham.*

Stirling.

The lordship and castle of Stirling were a part of the usual dowry of the queens of Scotland, at least after the family of Stuart came to the throne, in which they were invelted at their marriage.

Robert lord Erskine was appointed governor of the castle by king David II. and the office continued in that family till 1715.

This fortress hath been the scene of many transactions. Being by its situation considered as a key to the northern parts of the kingdom, the possession of it hath been always esteemed of great importance to those who fought to be masters of Scotland. In the space of little more than forty years, the English were four times in possession of it, and as often was it wrested from them by the Scots. In 1296, Edw. I. enraged at John Baliol's renunciation of his allegiance to him, marched into Scotland with a great army, and carried all before him. Stirling being deserted by its garrison, made no defence at all. But the English dominion in Scotland was never of long duration, being usually lost by revolutions as quick as those by which it was acquired. In 1298, the Scots, recovering their spirits, drove the invaders out of most parts of the kingdom; and laying siege to this castle, soon forced the garrison to a capitulation. This revolution obliged Edward again to assemble an army, and to march into Scotland; and, amongst his other feats, he invested the castle of Stirling, and besieged it with his whole train of artillery. It was commanded by William Oliphant, a brave officer, who held it out three months. So vigorous a defence so provoked Edward, that he ordered two pair of gallows to be erected, and proclamation to be made in the audience of the garrison, that if they did not surrender against a certain day, every man of them should be hanged without mercy: they surrendered before the day prefixed, but rather from want of provisions than fear of Edward's menaces. They were not, however, so far reduced as not to be able to make an honourable capitulation: but the souls of conquerors have seldom been found to be so great as their names; instead of punctually observing the articles of the capitulation, the English monarch treated the garrison with great inhumanity.

After the celebrated victory at Rosling in 1303, the Scots again laid siege to this fortress. After a short defence, the garrison was obliged to capitulate for want of provisions, and the command of it was given to Oliphant its former governor. That same year, however, Edward began to besiege it; but was not able to reduce it till after a siege of more than 12 months. This was the most memorable siege that it ever underwent. Having been unsuccessful the first campaign, Edward was obliged to lead his army into winter-quarters; but during the recess, he made formidable preparations for resumming the siege early in the spring. He stripped all the lead from several roofs in St Andrew's to supply his battering machines, which, as soon as the season of the year was proper for action, he planted against the walls, and summoned the governor to surrender, but without effect. Upon which he collected all his artillery, and furiously battered the walls with stones, as we are told,

of

Stirling. of 200 pounds weight, which made wide breaches in them; but the governor still refused to yield. His defence was so vigorous, that numbers of the besiegers perished by arrows and stones shot from the engines of the castle. So intent was Edward upon the reduction of the place, that he exposed his own person to great danger. An arrow from the castle had killed him outright, if he had not been protected by the goodness of his armour. Holding up the weapon, he threatened to hang the man who shot it, and resolved upon a general assault. By this time, the reiterated attacks of the besiegers had made great breaches in the walls; and the garrison was diminished, as to consist of only 28 persons, and these extremely weakened with watching and fatigue: apprehending, therefore, that a general assault would overpower them, they offered to capitulate.

Some of the Scottish historians affirm, that a capitulation was signed and sealed; but that Edward, in direct violation thereof, sent the governor prisoner to England, where he remained several years in confinement.

In the spring of the year 1314, Edward Bruce, brother to king Robert, laid siege to it; but on account of the vigorous defence made by Moubray the governor, he found himself obliged to abandon the enterprise. Only, by a treaty between them, it was agreed, that if no relief came from England before a fixed time, the garrison should surrender to the Scots. The fate of the detachment of cavalry sent from the English camp, under the conduct of lord Clifford, to the relief of the garrison, has been related under the article SCOTLAND, n° 159. After the great victory at Bannockburn, the place surrendered to Robert, who treated the garrison with a humanity of which none of the Edwards had set an example.

In 1333, this castle yielded to the Baliol party; and, according to some accounts, it was at that time dismantled, probably by orders from the English king, who had learned, by the experience of his grandfather, how dangerous a weapon it would prove if it should again come into the possession of the Scots: but in 1335 it was rebuilt by the orders of that monarch, and planted anew with a strong garrison. Soon after the reparation, the Brucean party, recovering strength by supplies from France, attempted the reduction of it; but it was relieved by Edward in person. Next year the siege was renewed and raised again by that monarch; but in 1341 the Scots, under Sir William Douglas, conducted the siege with such indefatigable industry, that the garrison was forced to capitulate, though upon honourable terms.

The last reduction of this fortress by siege was in 1651. When Cromwell followed king Charles II. into England before the battle of Worcester, he left General Monk behind to complete the conquest of Scotland, which he soon accomplished. Upon his arrival at Stirling, he planted his batteries in the churchyard, and upon some eminences adjoining; and in a short time made himself master of the castle. The impression made by the bullets of the besiegers are still visible upon the walls of several buildings in the castle. The marks of those shot by the besieged also still remain upon the steeple of the church; some of the corner-stones of which have been broken by them.

VOL. X.

By this conquest Monk became master of the principal registers of the kingdom; which, upon the surrender of the castle of Edinburgh the year before, had been carried to Stirling. He sent them to England by Cromwell's orders, to be lodged in the Tower, where they remained until the restoration of Charles in 1660, when, by the orders of that monarch, they were packed up in no less than 50 hogheads, to be carried back to Scotland; but the ship in which they were being cast away in a storm near Berwick, they were all irrecoverably lost. This calamity, together with that which befel our more ancient records by the malicious policy of Edward I. hath involved the Scottish history in great obscurity, and obliges us to remain in ignorance and uncertainty with respect to many important transactions of the nation. In 1746, the castle, defended by general Blackney, resisted the utmost efforts of the rebels.

STIRLINGSHIRE, a county of Scotland, of which Stirling is the capital. It extends 20 miles in length and 12 in breadth; being bounded on the west by part of Lennox and Clydesdale; on the east, by Clackmannanshire, the river Forth, and part of Lothian; on the south-east, by Lothian; and on the north, by Monticith. The face of the country is open and agreeable, diversified by hill and dale, well watered with streams and rivers; the principal of which is the Forth, rising in the neighbourhood of an high mountain called *Ben-Lomond*, and, running eastward, forms the frith of Edinburgh. The southern part is hilly, affording plenty of game, and pasturage for sheep, horses, and black cattle. The eastern part is fertile, producing plentiful harvests of corn, and great abundance of coal. Lead-ore is found in different parts of the shire; and the rivers abound with pike, trout, and salmon.

STIRRUP, in the manege, a rest or support for the horseman's foot, serving to keep him firm in his seat, and to enable him to mount.

Stirrups are allowed to be a modern invention: Menage observes, that St Jerom is the first author who mentions them. Matthiolus relates, that the Turks have a knack of poisoning their stirrups, with so subtle and penetrating a poison, that it makes its way through the boots, and kills the rider. F. le Comte tells us, that the Tartars ride cross-legged, and with their stirrups exceedingly short.

STOBEÆUS (John), a laborious Greek writer, who lived at the end of the fourth century, composed many works, of which there are only his Collections remaining, and even these are not as he composed them; many things being inserted by later authors. This work contains many important sentiments collected from the ancient writers, poets, and philosophers.

STOCK, in gardening, &c. the stem or trunk of a tree.

Stock-Broker. See BROKER and STOCKS.

Stock-Jobbing, the art or mystery of trafficking in the public stocks or funds. See STOCKS.

STOCKHOLM, the capital of Sweden, is situated in the province of Upland. It derives its name from *stock*, "wood;" and *holm*, an "island;" alluding to the timber used in building the city. It is situated on a cluster of small islands, and the houses are founded upon piles. Including the two suburbs, one of which

Stockholm. stands on the peninsula of Toren, and the other in Athundria. The town is as large and populous as Bristol. Here the king usually resides, and here the estates always assemble. The island on which the greatest part of Stockholm stands, is surrounded by two branches of a river that runs with great rapidity out of the lake Mælar; and over each of these arms there is a wooden bridge: from the city, the eye is regaled with the prospect of the lake on one side, and the sea on the other. The sea-water is here potable, the freshness being owing to the great quantity which the lake discharges. The castle or palace is a spacious building, without taste or magnificence, furnishing lodging-room not only to the royal-family: but likewise to the greater part of the officers belonging to the household. It likewise comprehends the national or supreme court of justice, the colleges of war, chancery, treasury, and commerce; a chapel, armoury, library, and office for the public records; but the greater number of inferior officers and servants belonging to the court, are, with the foot-guards, quartered on the burghers. The castle, and all the stately edifices in the kingdom, are covered with copper. The palace of the nobility, in which this order sits during the session of the diet, is an elegant building, adorned on the outside with marble statues and columns, and on the inside with painting and sculpture. This and three other palaces stand on the banks of the lake, and are built on the same model, so as to compose an uniform piece of architecture. The bank, built at the expence of the city, is a noble edifice, and joins with many sumptuous houses belonging to the nobility in exhibiting a splendid appearance. The houses of the burghers are generally built of brick in the city; but in the suburbs they are commonly made up of timber, and therefore very subject to conflagrations. These houses are often framed in Finland, according to the plan and dimensions prescribed: from thence they are transported in pieces to Stockholm by water, and there set up by the carpenters. These wooden habitations, if kept in proper repair, will last 30 or 40 years, and are deemed warmer, neater, and more healthy, than those of brick or stone. To prevent the danger of conflagrations, the city is divided into 12 wards. In each of these there is a master and four assistants, who forthwith repair to the place where the fire breaks out; and all porters and labourers are obliged to range themselves under the master of the ward to which they belong. A fire-watch patrols the streets by night, to give warning or assistance as it may be wanted; and a centinel is maintained in the steeple of every church, to toll the bell on the first appearance of any such accident. The police of Stockholm is entirely subjected to the regulations of the grand governor, assisted by a deputy and bailiff of the castle. This city is the staple of Sweden, to which all the commodities of the kingdom are brought for exportation, and where almost all the imports from abroad are deposited. The port or haven formed by the lake Mælar, is large enough to contain 1000 sail of shipping; and furnished with a key or wharf about an English mile in length, to which the vessels may lie with their broadsides. The greatest inconveniences attending this situation are, the distance from the sea, which is not within less than 10

miles of the town; the want of tides; and the winding of the river, which is remarkably crooked. It opens into the Baltic; and the entrance, which is dangerous and rocky, the Swedes have secured with two small forts: within, it is perfectly safe and commodious. The northern suburbs are remarkable for the king's gardens, and for the great number of artificers who have chosen their habitations in this quarter. In the fourth-ern suburbs the Muscovite commodities are sold; and here is a magnificent exchange where the merchants daily assemble. The two warlike monarchs, Gustavus Adolphus and Charles Gustavus, are buried in chapels belonging to the church of Redderholm, which formerly belonged to the Cordeliers, and is still known by the name of *Clooster-kirk*. E. Long. 19. 30. N. Lat. 59. 20.

STOCKING, that part of the clothing of the leg and foot which immediately covers their nudity, and screens them from the cold, &c. Anciently, the only stockings in use were made of cloth, or of milled fluffs sewed together; but since the invention of knitting and weaving stockings of silk, wool, cotton, thread, &c. the use of cloth stockings is quite out of fashion. The modern stockings, whether woven or knit, are a kind of plexuses, formed of an infinite number of little knots called *stitches*, *loops*, or *masses*, intermingled in one another.—Knit stockings are wrought with needles made of polished iron or brass wire, which interweave the threads, and form the masses the stocking consists of. This operation is called *knitting*; the invention whereof is commonly attributed to the Scots, on this ground, that the first works of this kind came from thence. It is added, that it was on this account that the company of stocking-knitters established at Paris in 1527, took for their patron St Fiacre, who is said to be the son of a king of Scotland.—Woven stockings are ordinarily very fine; they are manufactured on a frame, or machine of polished iron, the structure and apparatus whereof are exceedingly ingenious. The English and French have greatly contested the honour of the invention of the stocking-loom; but we are assured, whatever pretensions the French claim to this invention, that the same was certainly devised by William Lee, of St John's College, Cambridge, in the year 1589, though it is true, that he first made it public in France, after despairing of success in his own country.

STOCKTON upon Tees, a town of England in the county of Durham, about 16 miles south of the city of Durham. It is now a port of considerable trade; though, at the Restoration, it was a despicable village, the best house in which could hardly boast of any thing better than clay-walls and a thatched roof. About 40 years ago it sent out in one year 75 vessels for the port of London; and the trade is much increased since.

STOCKS, or PUBLIC FUNDS in England. By the word *stock* was originally meant, a particular sum of money contributed to the establishing a fund to enable a company to carry on a certain trade, by means of which the person became a partner in that trade, and received a share of the profit made thereby, in proportion to the money employed. But this term has been extended farther, though improperly, to signify any sum of money which has been lent to the governa-

Stocking
||
Stocks.

government, on condition of receiving a certain interest till the money is repaid, and which makes a part of the national debt. As the security both of the government and of the public companies is esteemed preferable to that of any private person, as the stocks are negotiable and may be sold at any time, and as the interest is always punctually paid when due; so they are thereby enabled to borrow money on a lower interest than what could be obtained from lending it to private persons, where there must be always some danger of losing both principal and interest.

But as every capital stock or fund of a company is raised for a particular purpose, and limited by parliament to a certain sum, it necessarily follows, that when that fund is completed, no stock can be bought of the company; though shares already purchased may be transferred from one person to another. This being the case, there is frequently a great disproportion between the original value of the shares and what is given for them when transferred: for if there are more buyers than sellers, a person who is indifferent about selling will not part with his share without a considerable profit to himself; and, on the contrary, if many are disposed to sell, and few inclined to buy, the value of such shares will naturally fall, in proportion to the impatience of those who want to turn their stock into specie.

These observations may serve to give our readers some idea of the nature of that unjustifiable and dishonest practice called *stock-jobbing*, the mystery of which consists in nothing more than this. The persons concerned in that practice, who are denominated *stock-jobbers*, make contracts to buy and sell, at a certain distant time, a certain quantity of some particular stock: against which time they endeavour, according as their contract is, either to raise or lower such stock, by raising rumours and spreading fictitious stories, in order to induce people either to sell out in a hurry, and consequently cheap, if they are to deliver stock, or to become unwilling to sell, and consequently to make it dearer, if they are to receive stock.

The persons who make these contracts are not in general possessed of any real stock: and when the time comes that they are to receive or deliver the quantity they have contracted for, they only pay such a sum of money as makes the difference between the price the stock was at when they made the contract, and the price it happens to be at when the contract is fulfilled; and it is no uncommon thing for persons not worth 100l. to make contracts for the buying or selling 100,000l. stock. In the language of Exchange Alley, the buyer in this case is called the *Bull*, and the seller the *Bear*.

Besides these, there are another set of men, who, though of a higher rank, may properly enough come under the same denomination. These are your great monied men, who are dealers in stock, and contractors with the government whenever any new money is to be borrowed. These indeed are not fictitious, but real buyers and sellers of stock; but, by raising false hopes or creating groundless fears, by pretending to buy or sell large quantities of stock on a sudden, by using the fore-mentioned set of men as their instruments, and other like practices, are enabled to raise or lower the stocks one or two *per cent.* at pleasure.

However, the real value of one stock above another, on account of its being more profitable to the proprietors, or any thing that will really, or only in imagination, affect the credit of company, or endanger the government, by which that credit is secured, must naturally have a considerable effect on the stocks. Thus, with respect to the interest of the proprietors, a share in the stock of a trading company which produces 5l. or 6l. *per cent. per annum* must be more valuable than an annuity with government-security, that produces no more than 3l. or 4l. *per cent. per annum*; and consequently such stock must sell at a higher price than such an annuity. Though it must be observed, that a share in the stock of a trading-company producing 5l. or 6l. *per cent. per annum*, will not fetch so much money at market as a government annuity producing the same sum; because the security of the company is not reckoned equal to that of the government, and the continuance of their paying so much *per annum* is more precarious, as their dividend is, or ought to be, always in proportion to the profits of their trade.

As the prices of the different stocks are continually fluctuating above and below par; so, when a person who is not acquainted with transactions of that nature, reads in the papers the prices of stocks, where bank-stock is marked perhaps 127l. India ditto 134l. 134½. South-Sea ditto 97½, &c. he is to understand that a 100l. of those respective stocks fell at such a time for those several sums.

In comparing the prices of the different stocks one with another, it must be remembered, that the interest due on them from the time of the last payment, is taken into the current price; and the seller never receives any separate consideration for it, except in the case of India bonds, where the interest due is calculated to the day of the sale, and paid by the purchaser over and above the premium agreed for. But as the interest on the different stocks is paid at different times, this, if not rightly understood, would lead a person, not well acquainted with them, into considerable mistakes in his computation of their value; some always having a quarter's interest due on them more than others, which makes an appearance of a considerable difference in the price, when in reality there is none at all. Thus, for instance, old South Sea annuities fell at present for 85½ l. or 85 l. 10 s. while new South-Sea annuities fetch only 84½ l. or 84 l. 15 s. though each of them produce the same annual sum of 1. 3 *per cent.* but the old annuities have a quarter's interest more due on them than the new annuities, which amounts to 15 s. the exact difference. There is, however, one or two causes that will always make one species of annuities sell somewhat lower than another, though of the same real value; one of which is, the annuities making but a small capital, and there not being for that reason so many people at all times ready to buy into it as into others, where the quantity is larger; because it is apprehended, that whenever the government pays off the national debt, they will begin with that particular species of annuity the capital of which is the smallest.

A stock may likewise be affected by the court of chancery; for if that court should order the money, which is under their direction, to be laid out in any

particular stock, that stock, by having more purchasers, will be raised to a higher price than any other of the like value.

By what has been said, the reader will perceive how much the credit and interest of the nation depends on the support of the public funds. While the annuities and interest for money advanced is there regularly paid, and the principal infused by both prince and people (a security not to be had in other nations), foreigners will lend us their property, and all Europe be interested in our welfare; the paper of the companies will be converted into money and merchandize, and Great Britain can never want cash to carry her schemes into execution.

In other nations, credit is founded on the word of the prince, if a monarchy; or that of the people, if a republic: but here, it is established on the interests of both prince and people; which is the strongest security: for however lovely and engaging honesty may be in other respects, interest, in money-matters, will always obtain confidence; because many people pay great regard to their interest, who have but little veneration for virtue. See the article FUNDS.

STOCKS, a frame erected on the shore of a river or harbour, whereon to build shipping. It generally consists of a number of wooden blocks, ranged parallel to each other, at convenient distances, and with a gradual declivity towards the water.

STOCKS, a wooden machine to put the legs of offenders in, for the securing of disorderly persons, and by way of punishment in divers cases, ordained by statute, &c.

STOICS, a sect of ancient philosophers, the followers of Zeno, thus called from the Greek *στοα*, which signifies a "porch or portico," in regard Zeno used to teach under a portico or piazza.

To the praise of the Stoics in general, it must be confessed, that, less intent than other philosophers upon frivolous and often dangerous speculations, they devoted their studies to the clearing up of those great principles of morality which were the firmest supports of society; but the driness and stiffness that prevailed in their writings, as well as in their manners, disgusted most of their readers, and abundantly lessened their utility. Zeno's chief followers, among the Greeks, were Lucippus, Cleanthes, Chrysippus, Diogenes Babylonius, Antipater, Panzeius, Posidonius, and Epictetus; among the Romans, Cato, Varro, Cicero, Seneca, the emperor Antoninus, &c. The Stoics cultivated logic, physics, metaphysics, &c. but especially ethics. The principles of their dogmata of the former kinds, are, That there are certain catalepsias or comprehensions, called *innate ideas* or *principles*, naturally found in the mind; that God is the seminal cause of the universe; and, with the Platonists, that the world is an animal, by reason of God's inhabiting and informing every part thereof; that nature is an artificial fire tending to generation; and that the world is at last to be destroyed by a conflagration. As for the morality of the Stoics, it was couched much in paradoxes; as, that a wise man is void of all passions or perturbation of mind; that pain is no real evil, but that a wise man is happy in the midst of torture, is always the same, and is always joyful; that there is none else free; that none else ought to be esteemed

king, magistrate, poet, or philosopher; that all wise men are great men; that they are the only friends or lovers; that nothing can happen to them beyond their expectations; that all virtues are insensibly connected together; that all good things are equal, and equally to be desired; that goodness admits of no increase or diminution. They own but one God, whom they however call by various names, as *Fate, Jupiter, &c.* by which they did not mean various things, but various powers and relations of the same thing. Providence they expressed under the name *Fate*, which Chrysippus defines to be a natural series or composition of things mutually following each other, by an immutable nexus or tie, fixed from all eternity. They held the immortality of the soul.

STOLBERG, a small town of Germany, in the circle of Upper Saxony, and territory of Thuringia, of which it is the capital place. It is seated among the mountains, 8 miles north-west of Leipzig. E. Long. 11. 12. N. Lat. 51. 46.

STOLE, a sacerdotal ornament wore by the Romish parish-priests over their surplice, as a mark of superiority in their respective churches; and by other priests over the alb, at celebrating of mass, in which case it goes across the stomach; and by deacons, over the left-shoulder, scarf-wise: when the priest reads the gospel for any one, he lays the bottom of his stole on his head. The stole is a broad swath, or slip of stuff, hanging from the neck to the feet, with three crosses thereon.

Groom of the STOLE, the eldest gentleman of his Majesty's bed-chamber, whose office and honour it is to present and put on his majesty's first garment, or shirt, every morning, and to order the things in the chamber.

STOMACH, in anatomy. See ANATOMY, n^o 352. STOMACHIC, medicines that strengthen the stomach and promote digestion, &c.

Stomachic corroboratives are such as strengthen the tone of the stomach and intestines; among which are carminatives, as the roots of galangals, red gentian, zedoary, pimpinella, calamus aromaticus, and arum. Of barks and rinds, those of canella alba, cassia, citrons, Seville and China oranges, &c. Of spices, pepper, ginger, cloves, cinnamon, cardamoms, and mace.

STONEHIVE, or STONEHAVEN, a small town in the county of Merns, in Scotland, 12 computed miles south from Aberdeen. It was built in the time of Charles II. and stands at the foot of some high cliffs, in a small bay, with a rocky bottom, opening a little in one part, so that small vessels may find admittance but only at high water. A pier laps over this harbour from the north side to secure them after their entrance. The town contains about 800 inhabitants. The manufactures are sail-cloths and Osna-burghs, knit worsted and thread stockings.

STONES, in natural history, are defined to be essentially compound fossils, not inflammable, nor soluble in water or oil, nor at all ductile: found in continued strata, or beds, of great extent: formed either of a congeries of small particles, in some degree resembling sand, and lodged in a smoother cementitious matter; or else of this cementitious matter, and the gritt or sand-like particles, running together into one smooth

smooth mafs; or, finally, of granules cohering by contact, without any cementitious matter among them; or composed of crystal or spar, usually debafed by earth, and often mixed with talc and other extraneous particles.

Of this class of fossils there are three orders; and under these, eight genera.

The first order comprehends all the coarse, harfh, and rough stones, of a lax texture, and composed of a visible grit, resembling fand in form, and usually immersed in a cementitious matter, and of little natural brightness; scarce capable of any polish, and naturally moulder away in form of powder from the tools of the workmen. The genera of this order are two, viz. the amnochista and psaduria; the former of which constitute our grey and rough flates; and the latter comprehends most of the stones used in building, particularly Portland stone.

The second order consists of stones moderately fine, of a more compact and even texture, scarce distinguishable construction, and affording no fand-like particles to the view; of some natural brightness, capable of a tolerable polish, and flying off from the tools of the workmen in form of small chips. Under this order are comprehended the iuxpexia and flegania.

The third order consists of stones of a very fine substance and elegant structure, naturally of a great brightness, and capable of an elegant polish; composed of granules of various shapes and sizes, but usually flatish, sometimes more sometimes less distinct; and, in some species, running together into uniform masses, but never lodged in any cementitious substance. Of this order are the marbles, alabasters, porphyries, and granites.

For the Origin and Formation of STONES, M. Tournefort, on his return from the east in the year 1702, proposed to the Royal Academy a new theory.—On a curious survey of the famous labyrinth of Crete, he observed, that several people had engraven their names in the living rock whereof its walls are formed; and, what was very extraordinary, the letters whereof they consisted, instead of being hollow, as they must have been at first (being all cut with knife-points), were prominent, and stood out from the surface of the rock like so many basso-relievo's. This is a phenomenon no otherwise accountable for than by supposing the cavities of the letters filled insensibly with a matter issuing from out of the substance of the rock, and which even issued in greater abundance than was necessary for filling the cavity. Thus is the wound made by the knife healed up, much as the fracture of a broken bone is consolidated by a callus formed of the extravasated nutritious juice which rises above the surface of the bone; and this resemblance is the more just, as the matter of the letters was found whitish, and the rock itself greyish. Something very like it is observed in the barks of trees, wherein letters have been cut with the knife; so that the poet had reason to say, that the characters grew as the trees themselves grew: *Crescent illas, crescentis amores*.—M. Tournefort supports his opinion by similar causes apparently formed in several other stones, which had reunited after by accident they had been broken.—From these observations it follows, that there are stones which grow in the quarries, and of consequence that are fed; that

the same juice which nourishes them serves to rejoin their parts when broken, just as in the bones of animals and the branches of trees when kept up by bandages; and in a word; that they vegetate.

M. Tournefort examines several kinds of stones, and finds them under the same necessity of feed. The immense quantity of flints wherewith the Crau of Arles is covered, he uses as an argument in behalf of this theory. The country there, for 20 miles round, is full of roundish flints, which are still found in equal abundance to whatever depth you dig. M. Peirese, who first proposed the generation of stones by means of seeds, (though he took the word *feed* in a very different sense from M. Tournefort), first brought this extraordinary campagne as a proof thereof. In effect, how could so many similar flints be formed? There is no saying they are coeval with the world, without asserting at the same time that all the stones in the earth were produced at once; which were to go directly contrary to the observations above-mentioned.

Among the seeds of stones, M. Tournefort observes, there are some which do not only grow soft by the juices of the earth, but even become liquid. These, then, if they penetrate the pores of certain bodies, grow hard, petrify, and assume the figure or impression of the body: thus what we call *peñitres*, *conchites*, *mytilites*, *ostracites*, *nautilites*, *echinites*, &c. are real stones, the liquid seeds whereof have insinuated into the cavities of the shells called *peñen*, *concha*, *mytilus*, *ostrea*, *nautilus*, *echinus*. On the contrary, if those liquid seeds fall on flints, on shells, sand, &c. they inclose those several bodies, and fixing between them, form a kind of cement, which yet grows like other stones. It is highly probable, he thinks, that such rocks as are only an assemblage of matted flints, have been formed by a number of these liquid seeds, in like manner as the quarries full of shells; unless the rocks have enveloped these bodies in their growth. He adds, that there are seeds of real stones inclosed in the spawn of certain shell-fish, as well as that hard solid matter destined to the forming their shells.

There is a particular kind of shell-fish called *pholas*, which is never found anywhere but in the cavities of flints, which are always found exactly fitted to receive them. Now it is highly improbable the fish should come and dig such a niche to spawn in; it is much more likely the stones they are found inclosed in were at first soft, and that the matter they are formed of was originally found in the spawn, in like manner as the matter which forms the egg-shell is really found in the seed thereof. See PHOLAS.

From the whole, he concludes, that the seed of stones, and even of metals, is a kind of dust which probably falls from them while they are alive, *i. e.* while they continue to vegetate as above. This dust may be compared to the seeds of several plants, as those of ferns, mosses, truffles, &c. which no microscope ever yet discovered, though their existence is not at all to be doubted.

M. Geoffroy accounts for the origin and formation of stones in a different manner. He lays it down as a principle, that all stones without exception have been fluid; or at least a soft paste, now dried and hardened; witness the stones wherein are found foreign bodies; witness also figured stones, &c.

On this principle he examines the formation of the different kinds of stones; and shows, that the earth alone suffices for the same, independent of all salts, sulphure, &c. The metallic particles contained in flints give them their colour, but these are only accidents; for proof of which, he instances the sapphires and emeralds of Auvergne, which lose all their colour by a moderate fire consuming their metallic parts, but without any damage to their transparency, they being hereby rendered mere crystals. M. Geoffroy conceives two kinds of primitive particles in the earth. Those of the first kind are exceedingly fine thin lamellæ, equal to each other, or nearly so. Now, when these meet together, from any cause whatever, in a sufficient quantity, the regularity and equality of their figures determine them to range themselves equally and regularly; and thus to form a homogeneous compound, which is very hard from the immediate contact of the parts, and very transparent by reason of their regular disposition, which leaves a free passage to the rays of light every way: and this is crystal. The parts of the second kind have all sorts of irregular figures, and must accordingly form assemblages that are much opaker and less hard. Now crystal is formed wholly of part of the first kind, and all other stones of a mixture of the two kinds of parts put together; this mixture is absolutely necessary in order to unite and bind together the parts of the second kind, and give them a hardness and consistence, without which they would only make a sand or dust. Water now appears to be the fittest vehicle to carry the parts of the first kind. This is seen from several petrifying springs, which inculate the pipes through which their waters are conveyed, or even solid bodies laid in them for some time. The water does not dissolve those earthy parts; it only keeps them in fusion, as it does the juices wherewith plants are fed. This water, thus charged with earthy particles of the first kind, M. Geoffroy calls the *stony or crystalline juice*, whereof those bodies are primarily formed.

STONES are of various kinds, with regard to the places they are produced in: the most ordinary are under ground; others in the bodies of men and other animals; others seem to be generated by the sea, as pumice, &c.; and others the effect of a petrifying virtue in certain waters. See PETRIFICATION, &c.

Artificial Stone. See STUCCO.

STONE in the Bladder. See MEDICINE, n° 486. and SURGERY.

STONE also denotes a certain quantity or weight of some commodities. A stone of beef at London is 8 pounds; in Hertfordshire, 12 pounds; and in Scotland, 16 pounds.

STONE-Chatter, in ornithology. See MOTACILLA.

STONEHENGE, a celebrated monument of antiquity in Salisbury Plain, six miles distant from that city. The particular spot on which it stands is in the lordship of West or Little Ambresbury in the possession the duke of Queensberry. The soil is chalky, and perfectly hard; so that the vast numbers of coaches and horses, which almost daily bring visitors to view this celebrated pile, have not been able to obliterate the track of the banks and ditches. It is situated near the summit of a hill, to which there is a very gentle ascent from the lower ground. The whole is inclosed with a circular ditch; which having passed, you ascend 35

yards before you come to the work itself; and the distance of the verge of the ditch within-side quite round to the building, is equal to the diameter of the building itself. The whole fabric consisted of four circles, or rather ovals, of stones, the most considerable of which had ten uprights, and five architraves or imposts, making up five trilithons, each trilithon consisting of two uprights and one impost, which locked them together at the top by tenons and mortises. These trilithons are not all of the same height, but each of them raised its head or impost somewhat higher as it drew nearest to that before which the altar is judged to have stood, and which appears to have been not only the highest, but finest, both for the smoothness and beauty of the stones. The height of these trilithons, with their architraves or cornices, is computed, at a medium, to be 24 feet, for there is no coming at an exact dimension in a work so decayed by time and weather; the uprights being between 20 and 21 feet high, and lessening a little upwards to the top, and the cornice computed about three feet and an half, making up the complement of 24 feet. These imposts, on the outward face, bore the same sweep with the oval which they composed; but on the inside within a straight line. They seem likewise to have been somewhat broader on the top than at the bottom, so that their sides bear a little slant downwards, whether to preserve them the better from the weather, or to make up the shortening which is caused by their elevation from the sight. The gradual ascent of these three orders, as they may be termed, of trilithons, is 13, 14, and 15 druidish cubits. The breadth of each trilithon is computed, in a medium, about 10 cubits of the same measure, and is consequently the length at least of the impost. Each upright is about 3 feet 9 nine inches thick, and twice that, *i. e.* 7 feet and an half in breadth, or 4 cubits and an half druidish. Each trilithon which composes this oval cell stands at such convenient distance from the other, as to yield a beautiful prospect into it; which is not a little heightened by the space which stands between the two uprights, and which widens upwards as these lessen in their breadth, and form an oval from its two centres, whose longest radius is 15, and shortest 12, druidish cubits; so that the ellipsis is formed by a line of 60 cubits, which being joined at the two ends, and turned round the two centres, give a diameter of 30 cubits at the longest, and 25 at the shortest, 5 cubits being the supposed distance between the two centres. Within this grand oval is another, of much lesser thorougher and finer stones. This circle (together with the long stone now broken, which is supposed to have been the altar, and is of a darkish-blue marble, such as is often set upon common altar-tombs, and about 16 feet in length) consists of 20 stones, the greatest part of which are broken and mangled; but not so much as to hinder a curious observer from recovering the order in which they stood, though their use and design is hard to be guessed at. Another circle or oval of 40 stones surrounded the cell or adytum at a proper distance. These were likewise of a much lesser size; after which one comes out to the greatest or outer circle, composed of 30 stones, likewise harder, and somewhat of a pyramidal form. It seems as if the founders had wisely provided, that their lesser bulk should

Stonchenge should be compensated by their solidity. The difference between this outward circle and that of the cell or adytum consisted in this, that the architraves of the triflithons of the latter did not touch one another, but preserved the same distance with the two uprights on which they were locked; whereas, in the former or outward circle, the flanders were joined by a continued cornice. Each flander or upright here had two tenons, at equal distances on the top, by which the two impostis were locked by their mortises, and so continued quite round in the form of a crown or cornice. The whole was surrounded by a vallum or deep ditch at a proportionate distance, as we have hinted above; and this, with the grand avenue and the gradual ascent up to the fabric, afforded a noble prospect, both as you advanced towards it, and much more when you viewed from it all the champaign country round it.

According to the unthinking vulgar, these stones were brought hither by magic, by the help of demons, or by giants, either of which were readily enough supposed able to bring them upon their backs from Africa; whilst the wiser sort rather imagined them to be facitious, and cast from some such composition as sand and mortar and the like, and hardened by the weather. This notion, however, has been disproved, though to the great detriment and disfiguring of the stones themselves, and the endangering of the structure.

These stones, rough and battered as they have been by these pretended curiosities, as well as by a long series of ages, appear to have been originally smoothed by the chisel, at least as far as they stand above-ground; for as to that part which lies buried in the earth, it shows itself, upon digging round it, to be in its primitive roughness; and as it was dugged up out of the quarry, or, more probably, as they were found lying on the surface of the ground in great numbers and various dimensions, perhaps ever since the creation of the world, and as they are to be seen still in vast quantities upon Marlborough Downs near Abury, at a place called from thence the *Grey Wethers*, and are of the same kind, to wit, a baldrick white marble.

The difficulty is, to conceive how stones of that immense weight, one of which, though neither the largest nor heaviest, has been computed by proper judges to weigh between 30 and 40 tons, and consequently would have required about 150 oxen to have drawn it, could be conveyed from their original seat to Stonehenge, which is 16 computed miles, and along such uneven grounds and in such quantities as compose the fabric. Sure it is, that no carriage can be conceived which would not have been sunk into the ground by such monstrous weight, unless it be that of rollers: but even this must appear a more than Herculean labour; the arduousness of which cannot be extenuated, but by the supposition that the whole, or at least the greatest part, of the nation contributed their help towards it in their turns.

The rearing of them afterwards in such form and situation was a work of no less difficulty; for though we may reasonably suppose that they were all pecked and chisled, had their mortises and tenons wrought, and every thing done that could lighten and fit them for the design, at the place where they were brought from; yet every man will easily perceive what an im-

mense labour it must have been to rear stones of that vast bulk and weight, to place them in their proper places, and at such due distances, that the architraves or impostis that locked them to each other at the top should fall so exactly every mortise upon its own tenon, as we find they actually do to this day: for it is plain to every eye that views them carefully, that each of these tenons are so exactly fitted to its mortise, that if either of the standing stones had been set ever so little out of its place, and perpendicular, they could never have locked one in the other till they were reduced to their due distance and position; especially considering that there were at least 15 in number of this large sort, set up two and two, the whole in a beautiful oval, nearest to a circle, and exactly locked each to the other by architraves of proportionable bigness. Each tenon is a druidish cubit, somewhat above 20 inches in diameter on the broadest side; for they are of an oval figure, and the mortises exactly answerable to it. By this contrivance the impostis or architraves lie firm locked upon the uprights, and these are kept firm to each other. Where the impostis are heaviest, the tenons are shortest; and where those are lightest, and consequently more in danger to be shaken, as in those of the outward circle, these are made longest, and the mortises deeper accordingly. If the bottom-face of the impost be divided into three squares, the two mortises will be found in the middle of the two outward ones: draw diagonal lines from corner to corner, and where they intersect is the centre of the mortise; which central distance from one to the other is seven druidish cubits, or about eight of ours. Some other particulars show the whole to have been done geometrically, and from such plain and simple principles as would best answer every purpose of the grand design. And hence we may frame an idea of the curiosities as well as arduousness of the work, which must be owned to outvie all that we read of single obelisks, pillars, and statues, how gigantic soever, if we except the pyramids of Egypt and the Rhodian colossus.

The first account of this structure we meet with is in Geoffroy of Monmouth, who, in the reign of king Stephen, wrote the history of the Britons in Latin. He tells us, that it was erected by the counsel of Merlin the British inchanter, at the command of Aurelius Ambrosius the last British king, in memory of 460 Britons who were murdered by Hengist the Saxon. The next account is that of Polydore Virgil, who says that the Britons erected this as a sepulchral monument of Aurelius Ambrosius. Others suppose it to have been a sepulchral monument of Boadicea the famous British Queen. Inigo Jones is of opinion that it was a Roman temple; from a stone 16 feet long and 4 broad, placed in an exact position to the eastward, altar-fashion. However, the opinion of Dr Stukely is the most probable, who thinks that it was the chief temple of the Druids in Britain; of which a very strong proof is, that it can be measured only by the cubit used by the Druids.

STOOL, in medicine, an evacuation or discharge of the feces by the anus.

STOPS. See **POINTS and PUNCTUATION**.

STORAX, or **STYRAX**, an odoriferous resinous substance, exuding, in the warmer climates, from a tree called by C. Bauhine *styrax folio mali cotonei*. It has

has been customary to distinguish three sorts of storax, though only one is usually met with in the shops.

1. *Styrax calamita*, or storax in the cane, so called from its having been formerly brought inclosed in reeds from Pamphylia: it is either in small distinct tears, of a whitish or reddish colour, or in larger masses composed of such.

2. Storax in the lump, or red storax. This is in masses of a uniform texture, and yellowish red or brownish colour, though sometimes likewise interspersed with a few whitish grains. Of this sort there has been some lately to be met with in the shops, under the name of *storax in the tear*.

3. The common storax of the shops is in large masses, considerably lighter and less compact than the foregoing: it appears upon examination to be composed of a fine resinous juice, mixed with a quantity of saw-dust. For what purpose this addition is made we shall not here inquire; observing only, that it can scarce be supposed to be done with any fraudulent view, since the saw-dust appears at sight. This common storax is much less esteemed than the two first sorts; though, when freed from the woody matter, it proves superior in point of fragrantcy to either of them. Rectified spirit, the common menstruum of resins, dissolves the storax, leaving the wood behind; nor does this tincture lose considerably of its valuable parts, in being inspissated to a solid consistence; whilst aqueous liquors elevate almost all the fragrantcy of the storax.

Storax is one of the most agreeable of the odoriferous resins, and may be exhibited to great advantage in languors and debilities of the nervous system: it is not, however, much used in common practice, unless as an ingredient in the traumatic balm, the compound powder and electuary of scordium, the storax pill, *confectio Paulina*, mithridate, and theriaca.

Liquid STORAX. What is most commonly met with under this name, is a soft resinous substance, of a grey colour, a weak smell, similar to that of the foregoing solid storax: it is supposed to be compounded of solid storax, resin, wine, and oil, beaten up together into a proper consistence. The genuine liquid storax, according to Petiver's account, (Phil. Transact, n° 313), is obtained from a tree growing in the island Cobros in the Red Sea. The preparers of this commodity yearly clear off the bark of the trees, and boil it in sea-water to the consistence of bird-lime: the resinous matter which floats upon the surface is taken off, liquefied again in boiling water, and passed through a strainer. The purer part which passes through, and the more impure which remains on the strainer, and contains a considerable portion of the substance of the bark, are both sent to Mocco, from whence they are sometimes, though very rarely, brought to us. The first is of the consistence of honey, tenacious, of a reddish or ash-brown colour, an acrid unctuous taste, approaching in smell to the solid storax, but so strong as to be disagreeable; the other is full of woody matter, and much weaker in smell. Liquid storax among us is scarce ever made use of in medicine, and not often found in the shops.

STORK, in ornithology. See ARDEA.

STOVES, in gardening, are buildings erected for the preservation of tender exotic plants, which, without that assistance, will not bear the cold of our win-

ter, because they require an artificial warmth.

Stoves are of two kinds, distinguished by the names of the *dry* and the *bark stoves*.

The dry stove has the flues, in which the smoke is carried, either laid under the pavement of the floor, or erected in the back-part of the house over each other, and returned six or eight times all along the stove. In these stoves the plants are placed on scaffolds and benches of boards, raised above one another; and the plants principally preferred in these, are the aloes, cereuses, euphorbiums, tithymals, and other succulent plants, which are impatient of moisture in winter; and therefore are not to be kept among trees or herbaceous plants, which perish freely.

The bark-stoves are made with a large pit, nearly of the length of the house, which is three feet deep, and six or seven feet wide. This pit is to be filled with fresh tanner's bark to make a hot-bed; and in this the pots, containing the tender plants, are to be plunged.

Stoves for heating Rooms. The most simple contrivance of this kind is that described by Dr Lewis in his *Commercium Philosophico-technicum*. He there recommends the two crucibles which he makes use of for a chemical furnace*, the one inverted over the other, and the joining secured by a hoop. These furnaces, says he, may be used likewise as a common stove, for keeping a room warm with a little quantity of fuel.—There are three general intentions which have been pursued in contrivances for this purpose: 1. Making the fuel take fire by degrees, and consume slowly; 2. conducting its heat, or the air warmed by it, through a number of passages or circulations, that the heat, instead of being carried up the chimney and thus lost, may be detained in these passages, and thence communicated to the air of the room to which they lie exposed; and 3. applying to the fire a quantity of solid matter, which, being once heated, preserves its heat long. Some ingenious furnaces, on these principles, are described in the Transactions of the Swedish academy, and in the second edition of Reaumur's Art of hatching Birds. All these contrivances are united in the following combination of the two pots and the hoop.

The undermost pot has the small grate introduced into its lower part, the fire-place door closed, and the ash-pit door or the bottom hole open for admitting air. Being then charged with small pieces of charcoal, and some lighted coals thrown above them, its top is covered by the largest of the grates; and on this is placed the hoop and dome, filled with balls of baked earth, or with pieces of bricks, so disposed as to leave small vacancies between them. If the stove is placed in the middle of a room, its injurious burnt air may be carried off by a pipe inserted laterally into the larger door of the dome, and communicating at the other end, which should be raised eight or ten inches, with the chimney of the room; all the other apertures of the dome being closed.

The furnace thus charged, will keep up a moderate and nearly equal warmth for many hours, without injury or offence; the charcoal burning down exceedingly slowly, and the heated balls or bricks continuing the warmth for a considerable time after the fuel is consumed. Fresh charcoal may be occasionally supplied

Stonbridge Stow, plied through the door above the grate: the check which the balls give to the motion of the air through the furnace renders the consumption of this also slow; and it may still be made more so at pleasure, by stopping a part of the aperture which admits the air, or of the pipe or chimney which carries it off.

STOURBRIDGE, or STURBICH, the name of a field near Cambridge, noted for its famous fair kept annually on the 7th of September, and which continues for a fortnight. The commodities are, horses, hops, iron, wool, leather, cheese, &c. This place is also noted for an excellent species of clay capable of resisting an intense heat. It is used in making pots for glasshouses, fire-bricks, &c. and is sold at an high price.

STOW, the name of a market-town in Gloucestershire in England, situated in W. Long. 1. 45. N. Lat. 51. 50. It is also the name of a fine seat of the earl of Temple in Buckinghamshire. Here are the best gardens in England, adorned with busts, statues, obelisks, pavilions, and temples. It is two miles from the town of Buckingham.

STOW (John), the industrious historian, son of Thomas Stow merchant-taylor of St Michael's, Cornhill, in London, was born about the year 1525. Of the early part of his life we know very little, except that he was bred to his father's business, which in the year 1560 he relinquished, devoting himself entirely to the study of our ancient historians, chronicles, annals, charters, registers, and records. Of these he made a considerable collection, travelling for that purpose to different parts of the kingdom, and transcribing such manuscripts as he could not purchase. But this profession of an antiquary being attended with no present emolument, he was obliged for subsistence to return to his trade. It happened, however, that his talents and necessities were made known to Dr Parker archbishop of Canterbury; who being himself an antiquary, encouraged and enabled Mr Stow to prosecute his darling study. In these times of persecution, though Elizabeth was then upon the throne, honest John Stow did not escape danger. His collection of Popish records were deemed cause of suspicion. His younger brother Thomas preferred no less than 140 articles against him before the ecclesiastical commission; but the proof being insufficient, he was acquitted. In 1565 he first published his Summary of the Chronicles of England. About the year 1584 he began his Survey of London. In 1585 he was one of the two collectors for a great muster of Limestreet ward: in the same year he petitioned the corporation of London to bestow on him the benefit of two freemen, to enable him to publish his survey; and in 1589 he petitioned again for a pension. Whether he succeeded, is not known. He was principally concerned in the second edition of Hollinshed's chronicle, published in 1587. He also corrected, and twice augmented, Chaucer's works, published in 1561 and in 1597. His survey of London was first published in 1598. To these laborious works he would gladly have added his large Chronicle, or History of England; but he lived only to publish an abstract of it, under the title of *Flores Historiarum*. The folio volume, which was printed after his death, with the title of *Stow's Chronicle*, was taken from his papers by Edmund

Howes. Having thus spent his life and fortune in these laborious pursuits, he was at last obliged to solicit the charitable and well-disposed for relief. For this purpose, king James I. granted him, in 1603, a brief, which was renewed in 1604, authorising him to collect in churches the benefactions of his fellow-citizens. He died in April 1605, aged 80; and was buried in his parish-church of St Andrew's Underhaft, where his widow erected a decent monument to his memory. John Stow was a most indefatigable antiquarian, a faithful historian, and an honest man.

STOWMARKET, a town of Suffolk in England, situated in E. Long. 1. 10. N. Lat. 52. 20. It is a large handsome place, situated between the branches of the rivers Gyppe and Orwell, and is remarkable for having the best cherries in England.

STOWAGE, the general disposition of the several materials contained in a ship's hold, with regard to their figure, magnitude, or solidity.

In the stowage of different articles, as ballast, casks, cases, bales, and boxes, there are several general rules to be observed, according to the circumstances or qualities of those materials. The casks which contain any liquid, are, according to the sea-phrase, to be *burg-up* and *bilge-free*, i. e. closely wedged up in an horizontal position, and resting on their quarters: so that the bilges, where they are thickest, being entirely free all round, cannot rub against each other by the motion of the vessel. Dry goods, or such as may be damaged by the water, are to be carefully inclosed in casks, bales, cases, or wrappers; and wedged off from the bottom and sides of the ship, as well as from the bow, masts, and pump-well. Due attention must likewise be had to their disposition with regard to each other, and to the trim and centre of gravity of the ship; so that the heaviest may always be nearest the keel, and the lightest gradually above them.

STRABISMUS, squinting. See MEDICINE, n° 476.

STRABO, a celebrated Greek geographer, philosopher, and historian, was born at Amasia, and was defended from a family settled at Gnosias in Crete. He was the disciple of Xenarchus, a Peripatetic philosopher, and at length attached himself to the Stoics. He contracted a strict friendship with Cornelius Gallus, governor of Egypt; and travelled into several countries to observe the situation of places, and the customs of nations. He flourished under Augustus; and died under Tiberius about the year 25, in a very advanced age. He composed several works; all of which are lost, except his *Geography* in 17 books; which are justly esteemed very precious remains of antiquity. The two first books are employed in showing, that the study of geography is not only worthy of, but even necessary to, a philosopher; the third describes Spain; the fourth, Gaul and the Britannie isles; the fifth and sixth, Italy and the adjacent isles; the seventh, which is imperfect at the end, Germany, the countries of the Getæ and Illyrii, Taurica, Chersonesus, and Epirus; the eighth, ninth, and tenth, Greece with the neighbouring isles; the four following, Asia within Mount Taurus; the fifteenth and sixteenth, Asia without Taurus, India, Persia, Syria, Arabia; and the seventeenth, Egypt, Ethiopia, Carthage, and other places of Africa. Strabo's work

Stow-market
Strabo.

Strada,
Strand.

was published with a Latin version by Xylander, and notes by Isaac Casaubon, at Paris, 1620, in folio; but the best edition is that of Amsterdam in 1707, in two volumes folio, by the learned Theodore Janfonius ab Almelooveen, with the entire notes of Xylander, Casaubon, Meursius, Cluver, Holstenius, Salmasius, Bochart, Ez. Spanheim, Cellarius, and others. To this edition is subjoined the *Chrestomathia*, or epitome of Strabo; which, according to Mr Dodwell, who has written a very elaborate and learned dissertation about it, was made by some unknown person between the years of Christ 676 and 956. It has been found of some use, not only in helping to correct the original, but in supplying in some measure the defect in the seventh book. Mr Dodwell's dissertation is prefixed to this edition.

STRADA (Famianus), a very ingenious and learned Jesuit, was born at Rome the latter end of the 16th century, and taught rhetoric there, in a public manner, for fifteen years. He wrote several pieces upon the art of oratory, and published some orations with a view of illustrating by example what he had inculcated by precept. But his *Prolusiones Academicæ*, and his *Historia de Bello Belgico*, are the works which raised his reputation, and have preserved his memory. His history of the war of Flanders was published at Rome; the first deced in 1640, the second in 1647; the whole extending from the death of Charles V. which happened in 1558, to the year 1590. It is written in good Latin, as all allow; but its merit in other respects has been variously determined. His *Prolusiones Academicæ* show great ingenuity, and a masterly skill in classical literature; that prolusion especially in which he introduces Lucan, Lucretius, Claudian, Ovid, Statius, and Virgil, each of them versifying according to his own strain. They have been often printed.—We know not the year of Strada's birth or of his death.

STRAIN, in surgery, a pain occasioned by the violent extension of some membranous or tendinous part. See SURGERY.

STRAIT, a narrow channel, or arm of the sea, contained between two opposite shores; as the straits of Gibraltar, the straits of Sundra, the straits of Dover, &c.

STRALSUND, a strong and rich sea-port town of Germany, in Hither Pomerania, and was formerly an important trading-place. In 1678 it was forced to surrender to the elector of Brandenburg, after 1800 houses had been burnt to ashes in one night's time. After this the Swedes defended it to the last extremity; and Charles XII. in 1714, came hither after his return out of Turkey. But the crown of Sweden not being able to hold out against five great powers, it was forced to submit in 1715. In 1720, it was rendered back to Sweden, but in a very poor condition. It is almost surrounded by the sea and the lake Francken, and has a harbour separated from the isle of Rugen by a narrow strait. It is 15 miles north-west of Grippswald, and 32 north-east of Gustrow. E. Lon. 13. 37. N. Lat. 54. 23.

STRAND (*Saxon*), any shore or bank of a sea or great river. Hence the street in the west suburbs of London, which lay next the shore or bank of the Thames, was called the *Strand*. An immunity from custom, and all impositions upon goods or vessels by

land or water, was usually expressed by *strand* or *stream*.

STRANDED (from the Saxon *Strand*), is when a ship is by tempest, or by ill steerage, run on ground, and so perishes. Where a vessel is stranded, justices of the peace, &c. shall command constables near the sea-coasts to call assistance for the preservation of the ship; and officers of men of war are to be aiding and assisting thereto.

STRANGLES, in farriery. See there, § x.

STRANGURY, a suppression of urine. See MEDICINE, n° 234.

STRASBURG, an ancient, large, handsome, populous, and strong city of France in Alsace. It contains about 200 streets, part of which are very narrow, and most of the houses are built after the ancient taste. However, there are a great number of handsome buildings, such as the hotel of the marshal of France, who is commander of the city; the hotel of the cardinal of Rouen, the bishop's palace, the Jesuits college, the royal hospital, the hotel of Hesse-Darmstadt, the arsenal, the town-house, and the cathedral. It has a wooden bridge over the Rhine, which is thought to be one of the finest in Europe; as is likewise the cathedral church, whose tower is the handsomest in Germany, and the clock is greatly admired by all travellers. Some look upon it as one of the wonders of the world, and the steeple is allowed to be the highest in Europe. The clock not only shows the hours of the day, but the motion of the sun, moon, and stars. Among other things there is an angel, which turns an hour-glass every hour; and the twelve apostles proclaim noon, by each of them striking a blow with a hammer on a bell. There is likewise a cock, which is a piece of clock-work, that crows every hour. There are 700 steps up to the tower or steeple, it being 500 feet high. It was a free and imperial city; but the king of France became master of it in 1681, and greatly augmented the fortifications, though before it had as many cannon as there are days in the year. The inhabitants were formerly Protestants, and carried on a great trade; but most of them have been obliged to embrace the Romish superstition, though there is still a sort of toleration. It is seated on the river Ill, 55 miles N. of Basil, 112 S. W. of Mentz, and 255 E. of Paris. E. Lon. 7. 51. N. Lat. 34. 35.

STRATA, in natural history, the several beds or layers of different matters whereof the earth is composed.

The strata whereof the earth is composed are so very different in different countries, that it is impossible to say any thing concerning them that may be generally applicable: and indeed the depths to which we can penetrate are so small, that only a very few can be known to us at any rate; those that lie near the centre, or even a great way from it, being for ever hid. The reason why we cannot penetrate to any great depth is, that as we go down, the air becomes foul, loaded with pernicious vapours, inflammable air, fixed air, &c. which destroy the miners, and there is no possibility of going on. In many places, however, these vapours become pernicious much sooner than others, particularly where sulphureous minerals abound, as in mines of metal, coal, &c.

But however great differences there may be among the

Stranded

Strata.

Strata.

the under strata, the upper one is in some respects the same all over the globe, at least in this respect, that it is fit for the support of vegetables, which the others are not, without long exposure to the air. Properly speaking, indeed, the upper stratum of the earth all round, is composed of the pure vegetable mold, tho' in many places it is mixed with large quantities of other strata, as clay, sand, gravel, &c.; and hence proceed the differences of soils so well known to those who practise agriculture.

It has been supposed, by some naturalists, that the different strata of which the earth is composed were originally formed at the creation, and have continued in a manner immutable ever since: but this cannot possibly have been the case, since we find that many of the strata are strangely intermixed with each other; the bones of animals both marine and terrestrial are frequently found at great depths in the earth; beds of oyster-shells are found of immense extent in several countries; and concerning these and other shell-fish, it is remarkable, that they are generally found much farther from the surface than the bones or teeth either of marine or terrestrial animals. Neither are the shells or other remains of fish found in those countries adjoining to the seas where they grow naturally, but in the most distant regions. Mr Whitehurst, in his Inquiry into the original state and formation of the earth, has given the following account of many different kinds of animals, whose shells and other remains or *exuvie* are found in England; though at present the living animals are not to be found except in the East and West Indies.

A CATALOGUE of EXTRANEOUS FOSSILS, showing where they were dug up; also their native Climates. Mostly selected from the curious Cabinet of Mr NEILSON, in King-Street, Red-Lion Square.

| Their Names, and Places where found. | Native Climates. |

| TAIL BUCCINUM. Sheppy Island, Hordel Cliff, Hampshire, | East Indies. |

Strata.

Nothing has more perplexed those who undertake to form theories of the earth than these appearances. Some have at once boldly asserted, from these and other phenomena, that the world is eternal. Others have had recourse to the universal deluge. Some, among whom is the Count de Buffon, endeavour to prove that the ocean and dry land are perpetually changing places; that for many ages the highest mountains have been covered with water, in consequence of which the marine animals just mentioned were generated in such vast quantities, that the waters will again cover these mountains, the habitable part of the earth become sea, and the sea become dry land as before, &c. Others have imagined that they might be occasioned by volcanoes, earthquakes, &c. which confound the different strata, and often intermix the productions of the sea with those of the dry land.

These subjects have been discussed under the article EARTH, to which therefore we refer the reader; and shall conclude with some account of the strata in those places where they have been most particularly observed.

Under the article NATURAL HISTORY, Sect. I. it is observed, that the upper strata of the earth and mountains generally consist of rag-stone, the next of slate, the third of marble filled with petrifications, the fourth again of slate; and the next of free-stone. But we are far from considering this as a rule which holds universally. The strata differ exceedingly in a great number of places; some instances of which we shall give from Mr Whitehurst.—At Alfreton Common in Derbyshire, the strata are,

Mr Forster has given an account of some of the strata of the South-Sea islands, the substance of which may be seen in the following table.

SOUTH GEORGIA.

1. No soil, except in a few crevices of the rocks.
2. Ponderous slate, with some iron particles, in horizontal strata, perpendicularly intersected with veins of quartz.

Southern Isle of New Zealand.

1. Fine light black mould, in some places nine inches deep, but generally not so much.
2. An argillaceous substance, nearly related to the clafs of TALCONS, turned into earth by the action of the air.
3. The same substance farther indurated, in oblique strata, generally dipping to the south.

EASTER ISLAND.

1. Reddish-brown dusty mould, looking as if it had been burnt.
2. Burnt rocks, resembling slags or dross and other volcanic matters.

MARQUESAS.

1. Clay mixed with mould.
2. An earthy argillaceous substance mixed with tarras and puzzolana.

O-TAHITEE.

The shores are coral rock, extending from the reef encircling these isles to the very high water-mark. There begins the sand, formed in some places from small shells and rubbed pieces of coral; but in others the shores are covered with blackish sand, consisting of the former sort mixed with black, sometimes glittering, particles of mica, and here and there some particles of the refractory iron ores called in England SKIM, the *ferrum micaceum* of Linnæus, and KALL the *molybdenum spuma lupi* of the same author. The plains from the shores to the foot of the hills are covered with a very fine thick stratum of black mould, mixed with the above-mentioned sand, which the natives manure with shells. The first and lower range of hills are formed of a red ochreous earth,

sometimes so intensely red, that the natives use it to paint their canoes and cloth. The higher hills consist of a hard, compact, and stiff clayey substance, hardening into stone when out of the reach of the sun and air. At the top of the valleys, along the banks of the rivers, are large masses of coarse granite stones of various mixtures; in one place are pillars of a grey, solid basalt; and, in several others, fragments of black basalt.

FRIENDLY ISLANDS and NEW HEBRIDES.

The same with the above.

MALLICOLLO.

Yellowish clay mixed with common sand.

TANNA, a Volcanic Island.

The chief strata here are clay mixed with aluminous earth, interperfed with lumps of pure chalk. The strata of the clay are about six inches, deviating very little from the horizontal line.

NEW CALEDONIA and the adjacent Isles.

The shores consist of shell-sand, and particles of quartz; the soil in the plains a black mould mixed with this sand. The sides of the hills composed of a yellow ochreous clay, richly spangled with small particles of cat-silver, or a whitish kind of daze, the *mica argentea* of Linnæus. The higher parts of the hills consist of a stone called by the German miners *gestellstein*, composed of quartz and great lumps of the above cat-silver. The latter is sometimes of an intensely red or orange colour, by means of an iron ochre.

“ From the above account, “ says Mr Forster, “ it appears, I think, evidently, that all the high tropical isles of the South Sea have been subject to the action of volcanoes. Pyritical and sulphureous substances, together with a few iron-stones, and some vestiges of copper, are no doubt found in several of them: but the mountains of New Caledonia are the most likely to contain the richest metallic veins; and the same opinion, I suspect, may be formed of the mountains in New Zealand.”

In the city of Modena in Italy, and for some miles round that place, there is the most singular arrangement of strata perhaps in the whole world. From the surface of the ground to the depth of 14 feet, they meet with nothing but the ruins of an ancient city. Being come to that depth, they find paved streets, artificers shops, floors of houses, and several pieces of inland work. After these ruins they find a very solid earth, which one would think had never been removed; but a little lower they find it black and marshy, and full of briars. Signior Ramazzini in one place found a heap of wheat entire at the depth of 24 feet; in another, he found silbert-trees with their nuts. At the depth of about 28 feet, they find a bed of chalk, about 11 feet deep, which cuts very easily; after this a bed of marshy earth of about two feet, mixed with rushes, leaves, and branches. After this bed comes another of chalk, nearly of the same thickness; and which ends at the depth of 42 feet. This is followed by another bed of marshy earth like the former; after which comes a new chalk-bed, but thinner, which also has a marshy bed underneath it. This ends at the depth of 63 feet; after which they find sand mingled with small gravel, and several marine shells. This

Stratum

Stratagem

Strix.

stratum is usually about five feet deep, and underneath it is a vast reservoir of water. It is on account of this water that the soil is so frequently dug, and the strata so well known in this part of the world. After coming to the sandy bottom above-mentioned, the workmen pierce the ground with a terebra or auger, when the water immediately springs up with great force, and fills the well to the brim. The flow is perpetual, and neither increases by rain, nor decreases by drought. Sometimes the auger meets with great trees, which give the workmen much trouble; they also sometimes see at the bottom of these wells, great bones, coals, flints, and pieces of iron.

It has been asserted by some, that the specific gravity of the strata constantly increased with the depth from the surface. But Dr Leigh, in his Natural History of Lancashire, speaking of the coal-pits, denies the strata to lie according to the laws of gravitation: observing, that the strata there are first a bed of marl, then free-stone, next iron-stone, then coal, or channel mire, then some other strata, then coal again, &c. This determined Mr Derham to make a nicer inquiry into the matter; accordingly, in 1712, he caused divers places to be bored, laying the several strata by themselves; and afterwards determined very carefully their specific gravity. The result was, that in his yard the strata were gradually specifically heavier and heavier, the lower and lower they went; but in another place in his fields, he could not perceive any difference in the specific gravities.

Acquainting the Royal Society therewith, their operator Mr Haukbee was ordered to try the strata of a coal-pit, which he did to the depth of 30 strata: the thickness and specific gravity of each whereof he gives us in a table in the Philosophical Transactions; and from the whole makes this inference, that it evidently appears the gravities of the several strata are in no manner of order, but purely casual, as if mixed by chance.

STRATAGEM, in the art of war, any device for deceiving and surprising an enemy.

STRATH, in the Scottish language, signifies a long narrow valley, with a river running along the bottom.

STRATHNAVER, a subdivision or district of the county of Sutherland in Scotland; bounded on the north by the ocean, on the east by Caithness, on the south by Sutherland properly so called, and on the west partly by Ross and partly by the ocean.

STRAWBERRY, in botany. See FRAGARIA.

STRAWBERRY-Tree. See ARBUTUS.

STRENGTH, in physiology, the same with force or power.

STRENGTHENERS, or CORROBORANTS, such medicines as add to the bulk and firmness of the solids; and such are all agglutinating and astringent medicines. See MATERIA MEDICA, n° 30. 36.

STRATED LEAF, among botanists, one that has a number of longitudinal furrows on its surface.

STRIKE, a measure of capacity, containing four bushels.

STRIX, the owl; in ornithology, a genus belonging to the order of accipitres. The bill is hooked, but has no cere or wax; the nostrils are covered with fetaceous feathers; the head is very large, as are also the ears and eyes; and the tongue is bifid. There

are 12 species; the most remarkable are,

1. The *Bubo*, or eagle-owl, in size is almost equal to an eagle. Irides bright yellow; head and whole body finely varied with lines, spots and specks of black, brown, cinereous, and ferruginous. Wings long; tail short, marked with dusky bars. Legs thick, covered to the very end of the toes with a close and full down of a testaceous colour. Claws great, much hooked, and dusky.—It has been shot in Scotland and in Yorkshire. It inhabits inaccessible rocks and desert places; and preys on hares and feathered game. Its appearance in cities was deemed an unlucky omen; Rome itself once underwent a lustration because one of them strayed into the capitol. The ancients had them in the utmost abhorrence; and thought them, like the screech-owls, the messengers of death. Pliny styles it *bubo funebris*, and *noctis monstrum*.

Solique culminibus ferali carmine bubo

Sape queri et longas in fletum ducere voces. VIRGIL.

Perch'd on the roof, the bird of night complains,

In lengthen'd shrieks and dire funeral strains.

2. The *otus*, or long-eared owl, is found, though not frequently, in the north of England, in Cheshire, and in Wales. Mr Hasselquist has seen it alive in Cairo, and it is not unfrequent all over Egypt. The weight of the female, according to Mr Willughby, is 10 ounces; the length 14 and a half; the breadth 3 feet 4 inches; the irides are of a bright yellow; the bill black; the breast and belly are of a dull yellow, marked with slender brown strokes pointing downwards; the thighs and vent-feathers of the same colour, but unpotted. The back and coverts of the wings are varied with deep brown and yellow; the quill-feathers of the same colour, but near the ends of the out-molt is a broad bar of red; the tail is marked with dusky and reddish bars, but beneath appears ash-coloured; the horns or ears are about an inch long, and consist of six feathers variegated with yellow and black; the feet are feathered down to the claws.

3. The short-eared owl, is 14 inches; extent three feet; the head is small and hawk-like; the bill is dusky; weight 14 ounces; the circle of feathers that immediately furrounds the eyes is black; the larger circle white, terminated with tawny and black; the feathers on the head, back, and coverts of the wings, are brown, edged with pale dull yellow; the breast and belly are of the same colour, marked with a few long narrow streaks of brown pointing downwards; the quill-feathers are dusky, barred with red; the tail is of a very deep brown, adorned on each side the shaft of the four middle feathers with a yellow circle which contains a brown spot; the tip of the tail is white. The horns of this species are very small, and each consists of only a single feather; these it can raise or depress at pleasure; and in a dead bird they are with difficulty discovered. This kind is scarcer than the former; both are solitary birds, avoiding inhabited places. These species may be called *long-winged owls*; the wings when closed reaching beyond the end of the tail; whereas in the common kinds they fall short of it.—This is a bird of passage, and has been observed to visit Lincolnshire in the beginning of October, and to retire early in the spring; so probably, as it performs its migrations with the woodcock, its summer-retreat is Norway. During day it lies hid in long:

long old grafs; when difturbed, it feldom flies far, but will light, and fit looking at one, at which time the horns may be feen very diftinctly. It has not been obferved to perch on trees like other owls; it will alfo fly in fearch of prey in cloudy hazy weather. Farmers are fond of feeing thefe birds in the fields, as they clear them from mice. It is found frequently on the hill of Hoy in the Orkneys, where it flies about and preys by day like a hawk. It is found alfo in Lancafhire, which is a hilly and wooded country; and in New-England and Newfoundland.

4. The flammae, or common white owl. The elegant plumage of this bird makes amends for the uncouthnefs of its form: a circle of foft white feathers furround the eyes. The upper part of the body, the coverts, and fecondary feathers of the wings, are of a fine pale yellow; on each fide the shafts are two grey and two white fots placed alternate: the exterior fides of the quill-feathers are yellow; the interior white, marked on each fide with four black fots: the lower fide of the body is wholly white; the interior fides of the feathers of the tail are white; the exterior marked with fome obfcure dufky bars; the legs are feathered to the feet: the feet are covered with foft hairs: the edge of the middle claw is ferrated. The ufual weight is 11 ounces; its length 14 inches; its breadth 3 feet.—This fpecies is almoft domeftic; inhabiting, for the greateft part of the year, barns, hay-lofts, and other out-houfes; and is as ufe-ful in clearing thofe places from mice as the congenial cat: towards twilight it quits its perch, and takes a regular circuit round the fields, fkimming along the ground in queft of field-mice, and then returns to its ufual refidence: in the breeding-feafon it takes to the caves of churches, holes in lofty buildings, or hollows of trees. During the time the young are in the neft, the male and female alternately fall out in queft of food, make their circuit, beat the fields with the regularity of a fpaniel, and drop infantly on their prey in the grafs. They very feldom flay out above five minutes; return with their prey in their claws; but as it is neceffary to fhift it into their bill, they always alight for that purpofe on the roof, before they attempt to enter their neft. This fpecies does not hoot; but fnores and hiffes in a violent manner; and while it flies along will often fcream moft tremendously. Its only food is mice. As the young of thefe birds keep their neft for a great length of time, and are fed even long after they can fly, many hundreds of mice will fcarcely fuffice to fupply them with food. Owls caft up the bones, fur, or feathers of their prey, in form of fmall pellets, after they have devoured it, in the fame manner as hawks do. A gentleman, on grubbing up an old pollard-afh that had been the habitation of owls for many generations, found at the bottom many bufhels of this rejected ftuff. Some owls will, when they are fatisfied, like dogs, hide the remainder of their meat.

5. The ulula, or tawny owl. The female of this fpecies weighs 19 ounces; the length is 14 ounces; the breadth 2 feet 8 inches; the irides are dufky: the ears in this, as in all owls, very large; and their fenfe of hearing very exquifite. The colour of this kind is fufficient to diftinguifh it from every other: that of the back, head, coverts of the wings, and on

the fcapular feathers, being a fine tawny red, elegantly fotted and powdered with black or dufky fots of various fizes: on the coverts of the wings, and on the fcapulars, are feveral large white fots: the coverts of the tail are tawny, and quite free from any marks: the tail is variously blotched, barred and fotted with pale red and black; in the two middle feathers the red predominates: the breaft and belly are yellowifh, mixed with white, and marked with narrow black ftrokes pointing downwards: the legs are covered with feathers down to the toes.—This is a hardier fpecies than the former; and the young will feed on any dead thing, whereas thofe of the white owl muft have a conftant fupply of frefh meat. It is the *Strix* of *Aldrovandus*, and what we call the *screech-owl*; to which the folly of fuperftition had given the power of prefaging death by its cries. The ancients believed that it fucked the blood of young children: a faft not incredible; for *Hafelquift* defcribes a fpecies found in Syria, which frequently in the evening flies in at the windows, and deftroys the helpless infant.

Nocte volant, puerisque petunt matris egentes,

Et vitulos cunctis corpora reptat lais.

Corpore dicuntur laetitia victora regifris,

Et plenum potu fanguine guttur habent.

Et illis frigibus nomen, fed nominis hujus

Caufa quod horrenda fridere nocte folent. Ovid *Faft.* vi. 135.

6. The ulula, or brown owl, agrees with the former in its marks; differing only in the colours: in this, the head, wings, and back, are of a deep brown, fotted with black in the fame manner as the former: the coverts of the wings and the fcapulars are adorned with fimilar white fots: the exterior edges of the four firft quill-feathers in both are ferrated: the breaft in this is of a very pale afh-colour mixed with tawny, and marked with oblong jagged fots: the feet, too, are feathered down to the very claws: the circle round the face is afh-coloured, fotted with brown.—Both thefe fpecies inhabit woods, where they refide the whole day: in the night they are very clamorous; and when they hoot, their throats are inflated to the fize of an hen's egg. In the dusk they approach our dwellings; and will frequently enter pigeon-houfes, and make great havoc in them. They deftroy numbers of little leverets, as appears by the legs frequently found in their nefts. They alfo kill abundance of moles, and fkin them with as much dexterity as a cook does a rabbit. Thefe build in hollow trees or ruined edifices; lay four eggs, of an elliptic form, and of a whitifh colour.

7. The pafferina, or little owl, is very rare in England; it is fometimes found in Yorkfhire, Flintfhire, and alfo near London: in fize it fcarcely exceeds a thrufh, though the fulnefs of its plumage makes it appear larger: the irides are of a light yellow; the bill of a paper-colour; the feathers that encircle the face are white tipped with black; the head brown, fotted with white; on the breaft is a mixture of white and brown; the belly is white, marked with a few brown fots; the tail of the fame colour with the back; in each feather barred with white; in each adorned with circular white fots, placed oppofite to one another on both fides the shaft; the legs and feet are covered with feathers down to the claws.—The Italians made ufe of this owl to decoy fmall birds to the lime twig: the method

Strobilus method of which is exhibited in Olina's *Uccelliera*, p. 65. Mr Stuart, author of the *Antiquities of Athens*, informed Mr Pennant, that this species of owl was very common in Attica; that they were birds of passage, and appeared there the beginning of April in great numbers; that they bred there; and that they retired at the same time as the storks, whose arrival they a little preceded.

8. The *orientalis*, or oriental owl, is of the size of the common owl, living in the ruins and old deserted houses of Egypt and Syria, and sometimes in those that are inhabited. The Arabs in Egypt call it *massafa*; the Syrians, *bana*. It is very ravenous in Syria; and in the evenings, if the windows are left open, it flies into houses, and kills infants, unless they are carefully watched; wherefore the women are much afraid of it.

STROBILUS, in botany. See there, p. 1293.

STROMBOLI, the most northerly of the Lipari islands, lying on the Tuscan Sea, towards the coast of Sicily. There are but a few families which inhabit one side of it; for the middle parts are raised up into an high volcano, continually throwing out fire and smoke. Sir William Hamilton passed by this island in his voyage to Sicily, but did not land. He observed that the volcano threw out great quantities of stones, and ashes; but no lava, excepting now and then a very little, which would run a small way down the side of the mountain, and there congeal.

STROPHE, in ancient poetry, a certain number of verses, including a perfect sense, and making the first part of an ode. See **POETRY**, p. 6305.

STRUMÆ, scrophulous tumours arising on the neck and throat, constituting what is commonly called the *king's evil*. See **MEDICINE**, n° 446.

STRUTHIO, the ostrich; a genus belonging to the order of grallæ. The bill is somewhat conical; the nostrils are oval; the wings short, and not fit for flying; and the feet are of the running kind. There are three species.

1. The camelus, or common ostrich, is the largest of all birds. Travellers affirm that they are seen as tall as a man on horseback; and even some of those that have been brought into England were above seven feet high. The head and bill somewhat resemble those of a duck; and the neck may be likened to that of a swan, but that it is much longer; the legs and thighs resemble those of an hen; though the whole appearance bears a strong resemblance to that of a camel. But though usually seven feet high from the top of the head to the ground, from the back it is only four; so that the head and neck are above three feet long. From the top of the head to the rump, when the neck is stretched out in a right line, it is six feet long, and the tail is about a foot more. One of the wings, without the feathers, is a foot and an half; and being stretched out, with the feathers, is three feet.

The plumage is much alike in all; that is, generally black and white; though some of them are said to be grey. There are no feathers on the sides, nor yet on the thighs, nor under the wings. The lower part of the neck, about half way, is covered with still smaller feathers than those on the belly and back; and those also are of different colours.

All these feathers are of the same kind, and pecu-

liar to the ostrich; for other birds have several sorts, some of which are soft and downy, and others hard and strong. Ostrich-feathers are almost all as soft as down, being utterly unfit to serve the animal for flying, and still less adapted to be a proper defence against external injury. The feathers of other birds have the webs broader on one side than the other, but those of the ostrich have their shaft exactly in the middle. The upper part of the head and neck are covered with a very fine clear white hair, that shines like the bristles of a hog; and in some places there are small tufts of it, consisting of about twelve hairs, which grow from a single shaft about the thickness of a pin.

At the end of each wing, there is a kind of spur almost like the quill of a porcupine. It is an inch long, being hollow and of an horny substance. There are two of these on each wing; the largest of which is at the extremity of the bone of the wing, and the other a foot lower. The neck seems to be more slender in proportion to that of other birds, from its not being furnished with feathers. The skin in this part is of a livid flesh-colour, which some, improperly, would have to be blue. The bill is short and pointed, and two inches and an half at the beginning. The external form of the eye is like that of a man, the upper eyelid being adorned with eye-lashes which are longer than those on the lid below. The tongue is small, very short, and composed of cartilages, ligaments, and membranes, intermixed with fleshy fibres. In some it is about an inch long, and very thick at the bottom; others it is but half an inch, being a little forked at the end.

The thighs are very fleshy and large, being covered with a white skin, inclining to redness, and wrinkled in the manner of a net, whose meshes will admit the end of a finger. Some have very small feathers here and there on the thighs; and others again have neither feathers nor wrinkles. What are called the legs of birds, in this are covered before with large scales. The end of the foot is cloven, and has two very large toes, which, like the leg, are covered with scales. These toes are of unequal sizes. The largest, which is on the inside, is seven inches long, including the claw, which is near three-fourths of an inch in length, and almost as broad. The other toe is but four inches long, and is without a claw.

The internal parts of this animal are formed with no less surprising peculiarity. At the top of the breast, under the skin, the fat is two inches thick; and on the fore-part of the belly it is as hard as suet, and about two inches and an half thick in some places. It has two distinct stomachs. The first, which is lowermost, in its natural situation somewhat resembles the crop in other birds; but it is considerably larger than the other stomach, and is furnished with strong muscular fibres, as well circular as longitudinal. The second stomach, or gizzard, has outwardly the shape of the stomach of a man; and upon opening is always found filled with a variety of discordant substances; hay, grass, barley, beans, bones, and stones, some of which exceed in size a pullet's egg. The kidneys are eight inches long and two broad, and differ from those of other birds in not being divided into lobes. The heart and lungs are separated by a midriff as in quadrupeds; and the parts of generation also bear a very strong

Struthio. strong resemblance and analogy.

The ostrich is a native only of the torrid regions of Africa, and has long been celebrated by those who have had occasion to mention the animals of that region. Its flesh is proscribed in Scripture as unfit to be eaten; and most of the ancient writers describe it as well known in their times. Like the race of the elephant, it is transmitted down without mixture; and has never been known to breed out of that country which first produced it. It seems formed to live among the sandy and burning deserts of the torrid zone; and, as in some measure it owes its birth to their genial influence, so it seldom migrates into tracts more mild or more fertile. The Arabians assert that the ostrich never drinks; and the place of its habitation seems to confirm the assertion. In these formidable regions ostriches are seen in large flocks, which to the distant spectator appear like a regiment of cavalry, and have often alarmed a whole caravan. There is no desert, how barren soever, but what is capable of supplying these animals with provision; they eat almost every thing; and these barren tracts are thus doubly grateful, as they afford both food and security. The ostrich is of all other animals the most voracious. It will devour leather, grass, hair, iron, stones, or any thing that is given. Those substances which the coats of the stomach cannot soften, pass whole; so that glass, stones, or iron, are excluded in the form in which they were devoured. In an ostrich dissected by Ranby, there appeared such a quantity of heterogeneous substances, that it was wonderful how any animal could digest such an overcharge of nourishment. Valsineri also found the first stomach filled with a quantity of incongruous substances; grass, nuts, cords, stones, glass, brass, copper, iron, tin, lead, and wood; a piece of stone was found among the rest that weighed more than a pound. He saw one of these animals that was killed by devouring a quantity of quick-lime. It would seem that the ostrich is obliged to fill up the great capacity of its stomach in order to be at ease; but that nutritious substances not occurring, it pours in whatever offers to supply the void.

In their native deserts, however, it is probable, they live chiefly upon vegetables, where they lead an inoffensive and social life; the male, as Thevenot assures us, assorting with the female with connubial fidelity. They are said to be very much inclined to venery; and the make of the parts in both sexes seems to confirm the report. It is probable also they copulate like other birds, by compression; and they lay very large eggs, some of them being above five inches in diameter, and weighing above fifteen pounds. These eggs have a very hard shell, somewhat resembling those of the crocodile, except that those of the latter are less and rounder.

The season for laying depends on the climate where the animal is bred. In the northern parts of Africa, this season is about the beginning of July; in the south, it is about the latter end of December. These birds are very prolific, and lay generally from 40 to 50 eggs at one clutch. It has been commonly reported, that the female deposits them in the sand, and covering them up, leaves them to be hatched by the heat of the climate, and then permits the young to

shift for themselves. Very little of this, however, is true: no bird has a stronger affection for her young than the ostrich, nor none watches her eggs with greater assiduity. It happens, indeed, in those hot climates, that there is less necessity for the continual incubation of the female; and she more frequently leaves her eggs, which are in no danger of being chilled by the weather: but though she sometimes forsakes them by day, she always carefully broods over them by night; and Kolben, who has seen great numbers of them at the Cape of Good Hope, affirms, that they sit on their eggs like other birds, and that the male and female take this office by turns, as he had frequent opportunities of observing. Nor is it more true what is said of their forsaking their young after they are excluded the shell. On the contrary, the young ones are not even able to walk for several days after they are hatched. During this time, the old ones are very assiduous in supplying them with grass, and very careful to defend them from danger; nay, they encounter every danger in their defence. It was a way of taking them among the ancients, to plant a number of sharp stakes round the ostrich's nest in her absence, upon which she pierced herself at her return. The young, when brought forth, are of an ash-colour the first year, and are covered with feathers all over. But in time these feathers drop; and those parts which are covered assume a different and more becoming plumage.

The beauty of a part of this plumage, particularly the long feathers that compose the wings and tail, is the chief reason that man has been so active in pursuing this harmless bird to his deserts, and hunting it with no small degree of expence and labour. The ancients used those plumes in their helmets; the ladies of the east make them an ornament in their dress; and among us, our undertakers and our fine gentlemen still make use of them to decorate their hairdresses and their hats. Those feathers which are plucked from the animal while alive, are much more valued than those taken when dead, the latter being dry, light, and subject to be worm-eaten.

Beside the value of their plumage, some of the savage nations of Africa hunt them also for their flesh; which they consider as a dainty. They sometimes also breed these birds tame, to eat the young ones, of which the female is said to be the greatest delicacy. Some nations have obtained the name of *Struthophagi*, or *ostrich-eaters*, from their peculiar fondness for this food; and even the Romans themselves were not averse to it. Even among the Europeans now, the eggs of the ostrich are said to be well-tasted, and extremely nourishing; but they are too scarce to be fed upon, although a single egg be a sufficient entertainment for eight men.

As the spoils of the ostrich are thus valuable, it is not to be wondered at that man has become their most assiduous pursuer. For this purpose, the Arabians train up their best and swiftest horses, and hunt the ostrich still in view. Perhaps, of all other varieties of the chase, this, though the most laborious, is yet the most entertaining. As soon as the hunter comes within sight of his prey, he puts on his horse with a gentle gallop, so as to keep the ostrich still in sight; yet so as to terrify him from the plain into the moun-

Struthio.

tains. Of all known animals, the ostrich is by far the swiftest in running: upon observing himself, therefore, pursued at a distance, he begins to run at first but gently; either insensible of his danger, or sure of escaping. In this situation, he somewhat resembles a man at full speed; his wings, like two arms, keep working with a motion correspondent to that of his legs; and his speed would very soon snatch him from the view of his pursuers; but, unfortunately for the silly creature, instead of going off in a direct line, he takes his course in circles; while the hunters still make a small course within, relieve each other, meet him at unexpected turns, and keep him thus still employed, till followed, for two or three days together. At last, spent with fatigue and famine, and finding all power of escape impossible, he endeavours to hide himself from those enemies he cannot avoid, and covers his head in the sand or the first thicket he meets. Sometimes, however, he attempts to face his pursuers; and though in general the most gentle animal in nature, when driven to desperation, he defends himself with his beak, his wings, and his feet. Such is the force of his motion, that a man would be utterly unable to withstand him in the flock.

The Struthophagi have another method of taking this bird: they cover themselves with an ostrich's skin, and passing up an arm through the neck, thus counterfeited all the motions of this animal. By this artifice they approach the ostrich, which becomes an easy prey. He is sometimes also taken by dogs and nets: but the most usual way is that mentioned above.

When the Arabians have thus taken an ostrich, they cut its throat; and making a ligament below the opening, they shake the bird as one would rattle a barrel: then taking off the ligature, there runs out from the wound in the throat a considerable quantity of blood mixed with the fat of the animal; and this is considered as one of their greatest dainties. They next flea the bird; and of the skin, which is strong and thick, sometimes make a kind of vest, which answers the purposes of a cuirass and a buckler.

There are others who, more compassionate or more provident, do not kill their captive, but endeavour to tame it, for the purposes of supplying those feathers which are in so great request. The inhabitants of Dara and Lybia breed up whole flocks of them, and they are tamed with very little trouble. But it is not for their feathers alone that they are prized in this domestic state; they are often ridden upon and used as horses. Moore assures us, that at Joar he saw a man travelling upon an ostrich; and Adanson asserts, that at the factory of Podore he had two ostriches, which were then young, the strongest of which ran swifter than the best English racer, although he carried two negroes on his back. As soon as the animal perceived that it was thus loaded, it set off running with all its force, and made several circuits round the village; till at length the people were obliged to stop it by barring up the way. How far this strength and swiftness may be useful to mankind, even in a polished state, is a matter that perhaps deserves inquiry.

2. The emu.—Of this bird, which many call the *American ostrich*, but little is certainly known. It is an inhabitant of the new continent, and is chiefly found in Guiana, along the banks of the Oronoko,

Vol. X.

in the inland provinces of Brazil and Chili, and the vast forests that border on the mouth of the river Plata. Many other parts of South America were known to have them; but as men multiplied, these large and timorous birds either fell beneath their superior power, or fled from their vicinity.

The emu, though not so large as the ostrich, is only second to it in magnitude. It is generally found to be six feet high, measuring from its head to the ground. Its legs are three feet long, and its thigh is near as thick as that of a man. The toes differ from those of the ostrich, as there are three in the American bird, and but two in the former. Its neck is long, its head small, and the bill flatted like that of the ostrich; but in all other respects it more resembles the third species called the *casowary*. The form of the body appears round; the wings are short, and entirely unsuited for flying; and it entirely wants a tail. It is covered from the back and rump with long feathers, which fall backward, and cover the anus: these feathers are grey upon the back, and white on the belly. It goes very swiftly, and seems assisted in its motion by a kind of tubercle behind, like an heel, upon which, on plain ground, it treads very securely: in its course it uses a very odd kind of action, lifting up one wing, which it keeps elevated for a time, till, letting it drop, it lifts up the other. What the bird's intention may be in thus keeping only one wing up, is not easy to discover; whether it makes use of this as a sail to catch the wind, or whether as a rudder to turn its course, in order to avoid the arrows of the Indians, yet remains to be ascertained: however this be, the emu runs with such a swiftness, that the fleetest dogs are thrown out in the pursuit. One of them, finding itself surrounded by the hunters, darted among the dogs with such fury, that they made way to avoid its rage; and it escaped, by its amazing velocity, in safety to the mountains.

As this bird is but little known, so travellers have given a loose to their imaginations in describing some of its actions, which they were conscious could not be easily contradicted. This animal, says Nierenberg, is very peculiar in the hatching of its young. The male compels 20 or 30 of the females to lay their eggs in one nest; he then, when they have done laying, chafes them away, and places himself upon the eggs; however, he takes the singular precaution of laying two of the number aside, which he does not sit upon. When the young ones come forth, these two eggs are added; which the male having foreseen, breaks one, and then another, upon which multitudes of flies are found to settle; and these supply the young brood with a sufficiency of provision till they are able to shift for themselves.

On the other hand, Wafer asserts, that he has seen great quantities of this animal's eggs on the desert shores north of the river Plata; where they were buried in the sand, in order to be hatched by the heat of the climate. Both this, as well as the preceding account, may be doubted; and it is more probable that it was the crocodile's eggs which Wafer had seen, which are undoubtedly hatched in that manner.

When the young ones are hatched, they are familiar, and follow the first person they meet. I have been followed myself, says Wafer, by many of these

41 P

young

Struthio.

Struthio. young ostriches; which at first are extremely harmless and simple; but as they grow older, they become more cunning and distrustful, and run so swift, that a greyhound can scarcely overtake them. Their flesh, in general, is good to be eaten, especially if they be young. It would be no difficult matter to rear up flocks of these animals tame, particularly as they are naturally so familiar; and they might be found to answer domestic purposes, like the hen or the turkey. Their maintenance could not be expensive, if, as Narborough says, they live entirely upon grass.

3. The cassowary is a bird which was first brought into Europe by the Dutch from Java in the East Indies; in which part of the world it is only to be found. Next to the preceding, it is the largest and the heaviest of the feathered species.

The cassowary, though not so large as the former, yet appears more bulky to the eye; its body being nearly equal, and its neck and legs much thicker and stronger in proportion; this conformation gives it an air of strength and force, which the fierceness and singularity of its countenance conspire to render formidable. It is five feet and an half long from the point of the bill to the extremity of the claws. The legs are two feet and an half high from the belly to the end of the claws. The head and neck together are a foot and an half; and the largest toe, including the claw, is five inches long. The claw alone of the least toe is three inches and a half in length. The wing is so small that it does not appear, it being hid under the feathers of the back. In other birds, a part of the feathers serve for flight, and are different from those that serve for merely covering; but in the cassowary all the feathers are of the same kind, and outwardly of the same colour. They are generally double, having two long shafts, which grow out of a short one which is fixed in the skin. Those that are double are always of an unequal length; for some are 14 inches long, particularly on the rump, while others are not above three. The beards that adorn the stem or shaft are about half-way to the end, very long, and as thick as an horse-hair, without being subdivided into fibres. The stem or shaft is flat, shining, black, and knotted below; and from each knot there proceeds a beard; likewise the beards at the end of the large feathers are perfectly black, and towards the root of a grey tawny colour; shorter, more soft, and throwing out fine fibres like down; so that nothing appears except the ends, which are hard and black; because the other part, composed of down, is quite covered. There are feathers on the head and neck; but they are so short and thinly sown, that the bird's skin appears naked, except towards the hinder part of the head, where they are a little longer. The feathers which adorn the rump are extremely thick; but do not differ in other respects from the rest, excepting their being longer. The wings, when they are deprived of their feathers, are but three inches long; and the feathers are like those on other parts of the body. The ends of the wings are adorned with five prickles, of different lengths and thickness, which bend like a bow; these are hollow from the roots to the very points, having only that slight substance within which all quills are known to have. The longest of these prickles is

11 inches; and it is a quarter of an inch in diameter at the root, being thicker there than towards the extremity; the point seems broken off.

The part, however, which most distinguishes this animal is the head; which, though small, like that of an ostrich, does not fail to inspire some degree of terror. It is bare of feathers, and is in a manner armed with an helmet of horny substance, that covers it from the root of the bill to near half the head backwards. This helmet is black before and yellow behind. Its substance is very hard, being formed by the elevation of the bone of the skull; and it consists of several plates, one over another, like the horn of an ox. Some have supposed that this was shed every year with the feathers; but the most probable opinion is, that it only exfoliates slowly like the beak. To the peculiar oddity of this natural armour, may be added the colour of the eye in this animal, which is a bright yellow; and the globe being above an inch and a half in diameter, give it an air equally fierce and extraordinary. The hole of the ear is very large and open, being only covered with small black feathers. The sides of the head, about the eye and ear, being deltitute of any covering, are blue, except the middle of the lower eye-lid, which is white. The part of the bill which answers to the upper jaw in other animals, is very hard at the edges above, and the extremity of it like that of a turkey-cock. The end of the lower mandible is slightly notched, and the whole is of a greyish brown, except a green spot on each side. As the beak admits a very wide opening, this contributes not a little to the bird's menacing appearance. The neck is of a violet-colour, inclining to that of slate; and it is red behind in several places, but chiefly in the middle. About the middle of the neck before, at the rise of the large feathers, there are two processes formed by the skin, which resemble somewhat the gills of a cock, but that they are blue as well as red. The skin which covers the fore-part of the breast, on which this bird leans and rests, is hard, callous, and without feathers. The thighs and legs are covered with feathers, and are extremely thick, strong, straight, and covered with scales of several shapes; but the legs are thicker a little above the foot than in any other place. The toes are likewise covered with scales, and are but three in number; for that which should be behind is wanting. The claws are of a hard solid substance, black without and white within.

The internal parts are equally remarkable. The cassowary unites with the double stomach of animals that live upon vegetables, the short intestines of those that live upon flesh. The intestines of the cassowary are 13 times shorter than those of the ostrich. The heart is very small, being but an inch and an half long, and an inch broad at the base. Upon the whole, it has the head of a warrior, the eye of a lion, the defence of a porcupine, and the swiftness of a courser.

Thus formed for a life of hostility, for terrifying others, and for its own defence, it might be expected that the cassowary was one of the most fierce and terrible animals of the creation. But nothing is so opposite to its natural character: it never attacks others; and instead of the bill, when attacked, it rather makes use of its legs, and kicks like a horse, or runs against

Struthio.

Struthio
Stucco.

its pursuer, beats him down, and treads him to the ground.

The manner of going of this animal is not less extraordinary than its appearance. Instead of going directly forward, it seems to kick up behind with one leg; and then making a bound onward with the other, it goes with such prodigious velocity, that the swiftest racer would be left far behind.

The same degree of voraciousness which we perceived in the ostrich, obtains as strongly here. The cassowary swallows every thing that comes within the capacity of its gullet. The Dutch assert, that it can devour not only glass, iron, and stones, but even live and burning coals, without testifying the smallest fear or feeling the least injury. It is said, that the passage of the food through its gullet is performed so speedily, that even the very eggs which it has swallowed whole pass through it unbroken in the same form they went down. In fact, the alimentary canal of this animal, as was observed above, is extremely short; and it may happen, that many kinds of food are indigestible in its stomach, as wheat or currants are to man, when swallowed whole.

The cassowary's eggs are of a grey-ash colour, inclining to green. They are not so large nor so round as those of the ostrich. They are marked with a number of little tubercles of a deep green, and the shell is not very thick. The largest of these is found to be 15 inches round one way, and about twelve the other.

The southern parts of the most eastern Indies seems to be the natural climate of the cassowary. Its domain, if we may so call it, begins where that of the ostrich terminates. The latter has never been found beyond the Ganges; while the cassowary is never seen nearer than the islands of Banda, Sumatra, Java, the Molucca islands, and the corresponding parts of the continent. Yet even here this animal seems not to have multiplied in any considerable degree, as we find one of the kings of Java making a present of one of these birds to the captain of a Dutch ship, considering it as a very great rarity.

STRYMON, (anc. geog.), formerly *Conopus*; a river constituting the ancient limits of Macedonia and Thrace; rising in mount Scombrus, (Aristotle). Authors differ as to the modern name of this river.

STRYPE (John), was descended from a German family, born at London, and educated at Cambridge. He was vicar of Low Layton in Essex, and distinguished himself by his compilations of *Lives and Memoirs*; in which, as Dr Birch remarks, his fidelity and industry will always give a value to his writings, however destitute they may be of the graces of style. He died in 1737, after having enjoyed his vicarage near 68 years.

STUCCO, in building, a composition of white

marble pulverized, and mixed with plaster of lime; and the whole being sifted and wrought up with water is to be used like common plaster: this is called by Pliny *marmoratum opus*, and *albarium opus*.

A patent has lately been granted to Mr B. Higgins for inventing a new kind of stucco or water-cement, more firm and durable than any heretofore. Its composition, as extracted from the specification signed by himself, is as follows. "Drift-sand, or quarry (A) sand, which consists chiefly of hard quartzose flat-faced grains with sharp angles; which is the freest, or may be most easily freed by washing, from clay, salts, and calcareous, gypseous, or other grains less hard and durable than quartz; which contains the smallest quantity of pyrites or heavy metallic matter inseparable by washing; and which suffers the smallest diminution of its bulk in washing in the following manner, is to be preferred before any other. And where a coarse and a fine sand of this kind, and corresponding in the size of their grains with the coarse and fine sands hereafter described, cannot be easily procured, let such sand of the foregoing quality be chosen as may be sorted and cleaned in the following manner.

"Let the sand be sifted in streaming clear water, through a sieve which shall give passage to all such grains as do not exceed one-sixteenth of an inch in diameter; and let the stream of water and the sifting be regulated so that all the sand, which is much finer than the Lynn-sand commonly used in the London glass-houses, together with clay and every other matter specifically lighter than sand, may be washed away with the stream, whilst the purer and coarser sand, which passes through the sieve, subsides in a convenient receptacle, and whilst the coarse rubbish and rubble remain on the sieve to be rejected.

"Let the sand which thus subsides in the receptacle be washed in clean streaming water, through a finer sieve, so as to be further cleaned and sorted into two parcels; a coarser, which will remain in the sieve which is to give passage to such grains of sand only as are less than one-thirtieth of an inch in diameter, and which is to be saved apart under the name of *coarse sand*; and a finer, which will pass through the sieve and subside in the water, and which is to be saved apart under the name of *fine sand*.—Let the coarse and the fine sand be dried separately, either in the sun or on a clean iron-plate set on a convenient furnace, in the manner of a sand-heat (B).

"Let lime be chosen (C) which is stone-lime, which heats the most in flaking, and flakes the quickest when duly watered; which is the freshest made and closest kept; which dissolves in distilled vinegar with the least effervescence, and leaves the smallest residue insoluble, and in this residue the smallest quantity of clay, gypsum, or martial matter.

41 P 2

"Let

(A) "This is commonly called *pit-sand*.

(B) "The sand ought to be stirred up continually until it is dried, and is then to be taken off; for otherwise the evaporation will be very slow, and the sand which lies next the iron plate, by being overheated, will be discoloured.

(C) "The preference given to stone-lime is founded on the present practice in the burning of lime, and on the closer texture of it, which prevents it from being so soon injured by exposure to the air, as the more spongy chalk-lime is; not on the popular notion that stone-lime has something in it whereby it excels the best chalk in the cementing properties. The gypsum contained in lime-stone remains unaltered, or very little altered, in the lime, after the burning; but it is not to be expected that clay or martial matter should be found in their native state, in well-burned lime; for they concrete or vitrify with a part of the calcareous earth, and constitute the hard grains or lumps, which remain undissolved in weak acids, or are separable from the slaked lime by sifting it immediately through a sieve.

" Let the lime chosen according to these important rules, be put in a brags-wired sieve to the quantity of 14 pounds. Let the sieve be finer than either of the foregoing; the finer, the better it will be: let the lime be flaked (D) by plunging it in a butt filled with soft water, and raising it out quickly and suffering it to heat and fume, and by repeating this plunging and raising alternately, and agitating the lime, until it be made to pass through the sieve into the water; and let the part of the lime which does not easily pass through the sieve be rejected: and let fresh portions of the lime be thus used, until as many (E) ounces of lime have passed through the sieve as there are quarts of water in the butt. Let the water thus impregnated stand in the butt closely covered (F) until it becomes clear; and through wooden (G) cocks placed at different heights in the butt, let the clear liquor be drawn off as fast (H) and as low as the lime subsides, for use. This clear liquor I call the *cementing liquor* (I). The freer the water is from saline matter, the better will be the cementing liquor made with it.

" Let 56 pounds of the aforesaid chosen lime be flaked, by gradually sprinkling on it, and especially on the unflaked pieces, the cementing liquor, in a close (K) clean place. Let the flaked part be immediately (L) sifted thro' the last-mentioned fine brags-wired sieve: Let the lime which passes be used instantly or kept in air-tight vessels, and let the part of the lime which does not pass through the sieve be rejected (M).—This finer richer part of the lime which

passes through the sieve I call *purified lime*.

" Let bone-ash be prepared in the usual manner by grinding the whitest burnt bones, but let it be sifted to be much finer than the bone-ash commonly sold for making cupels.

" The most eligible materials for making my cement being thus prepared, take 56 pounds of the coarse sand and 42 pounds of the fine sand; mix them on a large plank of hard wood placed horizontally; then spread the sand so that it may stand to the height of six inches with a flat surface on the plank; wet it with the cementing liquor; and let any superfluous quantity of the liquor, which the sand in the condition described cannot retain, flow away off the plank. To the wettest sand add 14 pounds of the putrefied lime in several successive portions, mixing and beating them up together in the mean time with the instruments generally used in making fine mortar: then add 14 pounds of the bone-ash in successive portions, mixing and beating all together. The quicker and the more perfectly these materials are mixed and beaten together, and the sooner the cement thus formed is used, the better (N) it will be. This I call the *water-cement coarse-grained*, which is to be applied in building, pointing, plastering, stuccoing, or other work, as mortar and stucco now are; with this difference chiefly, that as this cement is shorter than mortar or common stucco, and dries sooner, it ought to be worked expeditiously in all cases; and in stuccoing, it ought to be laid on by sliding the trowel upwards

(D) " This method of impregnating the water with lime is not the only one which may be adopted. It is however preferred before others, because the water clears the sooner in consequence of its being warmed by the flaking lime; and the gypseous part of the lime does not diffuse itself in the water so freely in this way as it does when the lime is flaked to fine powder in the common method, and is then blended with the water; for the gypseous part of the lime flakes at first into grains rather than into fine powder, and will remain on the sieve after the pure lime has passed through, long enough to admit of the intended separation; but when the lime is otherwise flaked, the gypseous grains have time to flake to a finer powder, and passing through the sieve, dissolve in the water along with the lime. I have imagined that other advantages attended this method of preparing the lime-water, but I cannot yet speak of them with precision.

(E) " If the water contains no more acidulous gas than is usually found in river or rain water, a fourth-part of this quantity of lime, or less, will be sufficient.

(F) " The calcareous crust which forms on the surface of the water ought not to be broke, for it assists in excluding the air, and preventing the absorption of acidulous gas whereby the lime-water is spoiled.

(G) " Brags-cocks are apt to colour a part of the liquor.

(H) " Lime-water cannot be kept many days unimpaired, in any vessels that are not perfectly air-tight. If the liquor be drawn off before it clears, it will contain whitening, which is injurious; and if it be not instantly used after it is drawn limpid from the butt into open vessels, it will grow turbid again, and deposit the lime changed to whitening by the gas absorbed from the air. The calcareous matter which subsides in the butt resembles whitening the more nearly as the lime has been more sparingly employed; in the contrary circumstances, it approaches to the nature of lime; and in the intermediate state, it is fit for the common composition of the plasterers for inside stucco.

(I) " At the time of writing this specification, I preferred this term before that of lime-water, on grounds which I had not sufficiently examined.

(K) " The vapour which arises in the flaking of lime contributes greatly to the flaking of these pieces which lie in its way; and an unnecessary waste of the liquor is prevented, by applying it to the lime heaped in a pit or in a vessel, which may restrain the issue of the vapour, and direct it through the mails. If more of the liquor be used than is necessary to flake the lime, it will create error in weighing the flaked powder, and will prevent a part of it from passing freely through the sieve. The liquid is therefore to be used sparingly, and the lime which has escaped its action is to be sprinkled apart with fresh liquor.

(L) " When the aggregation of the lumps of lime is thus broken, it is impaired much sooner than it is in the former state, because the air more freely pervades it.

(M) " Because it consists of heterogeneous matter or of ill-burnt lime; which last will flake and pass through the sieve, if the lime be not immediately sifted after the flaking, agreeable to the text.

(N) " These proportions are intended for a cement made with sharp sand, for incrustation in exposed situations, where it is necessary to guard against the effects of hot weather and rain. In general, half this quantity of bone-ashes will be found sufficient; and although the incrustation in this latter case will not harden deeply so soon, it will be ultimately stronger, provided the weather be favourable.

" The injuries which lime and mortar sustain by exposure to the air, before the cement is finally placed in a quiescent state, are great; and therefore our cement is the worse for being long beaten, but the better as it is quickly beaten until the mixture is effected, and no longer.

upwards on it; that the materials used along with this cement in building, or the ground on which it is to be laid in stuccoing, ought to be well wetted with the cementing liquor in the instant of laying on the cement; and that the cementing liquor is to be used when it is necessary to moisten the cement, or when a liquid is required to facilitate the floating of the cement.

"When such cement is required to be of a finer texture, take 8 pounds of the fine sand, wet it with the cementing liquor, and mix it with the purified lime and the bone-ash in the quantities and in the manner above described; with this difference only, that 15 pounds of lime, or (o) thereabouts, are to be used instead of 14 pounds, if the greater part of the sand be as fine as Lynn sand. This I call *water-cement fine-grained*. It is to be used in giving the last coating, or the finish to any work intended to imitate the finer-grained stones or stucco. But it may be applied to all the uses of the water-cement coarse-grained, and in the same manner.

"When for any of the foregoing purposes of pointing, building, &c. such a cement is required much cheaper and coarser-grained, then much coarser clean sand than the foregoing coarse sand, or well-washed fine rubble, is to be provided. Of this coarsest sand or rubble take 56 pounds, of the foregoing coarse sand 28 pounds, and of the fine sand 14 pounds; and after mixing these, and wetting them with the cementing liquor in the foregoing manner, add 14 pounds, or somewhat less, of the (p) purified lime, and then 14 pounds, or somewhat less, of the bone-ash, mixing them together in the manner already described. When my cement is required to be white, white sand, white lime, and the whitest bone-ash, are to be chosen. Grey sand, and grey bone-ash formed of half-burnt bones, are to be chosen to make the cement grey; and any other colour of the cement is obtained, either by choosing coloured sand, or by the admixture of the necessary quantity of coloured talc in powder, or of coloured vitreous or metallic powders, or other durable colouring ingredients commonly used in paint.

"To the end that such a water-cement as I have

described may be made as useful as it is possible in all circumstances; and that no person may imagine that my claim and right under these letters-patent may be eluded by divers variations which may be made in the foregoing process without producing any notable defect in the cement; and to the end that the principles of this art, as well as the art itself, of making my cement, may be gathered from this specification and perpetuated to the public; I shall add the following observations.

"This my water-cement, whether the coarse or fine grained, is applicable in forming artificial stone, by making alternate layers of the cement and of flint, hard stone, or brick, in moulds of the figure of the intended stone, and by exposing the masses so formed to the open (q) air to harden.

"When such cement is required for water (s) fences, two-thirds of the prescribed quantity of bone-ashes are to be omitted; and in the place thereof an equal measure of powdered terras is to be used; and if the sand employed be not of the coarsest sort, more terras must be added, so that the terras shall be by weight one-sixth part of the weight of the sand.

"When such a cement is required of the finest grain (s) or in a fluid form, so that it may be applied with a brush, flint-powder, or the powder of any quartzose or hard earthy substance, may be used in the place of sand; but in a quantity smaller as the flint or other powder is finer; so that the flint-powder, or other such powder, shall not be more than six times the weight of the lime, nor less than four times its weight. The greater the quantity of lime within these limits, the more will the cement be liable to crack by quick drying, and *vice versa*.

"Where such sand as I prefer cannot be conveniently procured, or where the sand cannot be conveniently washed and sorted, that sand which most resembles the mixture of coarse and fine sand above prescribed, may be used as I have directed, provided due attention is paid to the quantity of the lime, which is to be the greater (r) as the sand is the finer, and *vice versa*.

"Where sand cannot be easily procured, any durable stony body, or baked earth grossly powdered (u) and sorted nearly to the sizes above prescribed for sand,

(o) "The quantity of bone-ashes is not to be increased with that of the lime; but it is to be lessened as the exposure and purposes of the work will admit.

(p) "Because less lime is necessary, as the sand is coarser.

(q) "But they must not be exposed to the rain until they are almost as strong as fresh Portland stone; and even then they ought to be sheltered from it as much as the circumstances will admit. These stones may be made very hard and beautiful, with a small expence of bone-ash, by soaking them, after they have dried thoroughly and hardened, in the lime-liquor, and repeating this process twice or thrice, at distant intervals of time. The like effect was experienced in incrustations.

(r) "In my experiments, mortar made with terras-powder, in the usual method, does not appear to form so strong a cement for water-fences as that made, according to the specification, with coarse sand; and I see no more reason for avoiding the use of sand in terras-mortar, than there would be for rejecting stone from the embankment. The bone-ashes meant in this place are the dark grey or black sort. I am not yet fully satisfied about the operation of them in this instance.

(s) "The qualities and uses of such fine calcareous cement are recommended chiefly for the purpose of smoothing and finishing the stronger crustaceous works, or for washing walls to a lively and uniform colour. For this last intention, the mixture must be as thin as new cream, and laid on briskly with a brush, in dry weather; and a thick and durable coat is to be made by repeated washing; but is not to be attempted by using a thicker liquor; for the coat made with this last is apt to scale, whilst the former endures the weather much longer than any other thin calcareous covering that has been applied in this way. Fine yellow ochre is the cheapest colouring-ingredient for such wash, when it is required to imitate Bath-stone, or the warm-white stones.

(t) "If sea-sand be well washed in fresh water, it is as good as any other round sand.

(u) "The cement made with these and the proper quantities of purified lime and lime-water, are inferior to the best,

Stucco;
||
Stuff.

and, may be used in the place of sand, measure for measure, but not weight for weight, unless such gross powder be as heavy specifically as sand.

" Sand may be cleaned from every softer, lighter, and less durable matter, and from that part of the sand which is too fine, by various methods preferable (x), in certain circumstances, to that which I have described.

" Water may be found naturally free from fixable gas, selenite, or clay: such water may, without any notable inconvenience, be used in the place of the cementing liquor; and water approaching this state will not require so much lime as I have ordered to make the cementing liquor; and a cementing liquor sufficiently useful may be made by various methods of mixing lime and water in the described proportions, or nearly so.

" When stone-lime cannot be procured, chalk-lime or shell-lime, which best resembles stone-lime, in the characters above written of lime, may be used in the manner described, except that fourteen pounds and a half of chalk-lime will be required in the place of fourteen pounds of stone-lime. The proportion of lime which I have prescribed above may be increased without inconvenience, when the cement or stucco is to be applied where it is not liable to dry quickly; and in the contrary circumstance this proportion may be diminished; and the defect of lime in quantity or quality may be very advantageously supplied (y), by causing a considerable quantity of the cementing liquor to soak into the work, in successive portions and at distant intervals of time, so that the calcareous matter of the cementing liquor, and the matter attracted from the open air, may fill and strengthen the work.

" The powder of almost every well-dried or burnt animal-substance may be used instead of bone-ash; and several earthy powders, especially the micaceous and the metallic; and the elixated ashes of divers vegetables whose earth will not burn to lime; and the ashes of mineral fuel, which are of the calcareous kind, but will not burn to lime, will answer the ends of bone-ash in some degree.

" The quantity of bone-ash described may be lessened without injuring the cement, in those circumstances especially which admit the quantity of lime to be lessened, and in those wherein the cement is not liable to dry quickly. And the art of remedying the defects of lime may be advantageously practised to supply the deficiency of bone-ash, especially in building and in making artificial stone with this cement.

STUDDING SAILS, certain light sails extended, in moderate and steady breezes, beyond the skirts of the principal sails, where they appear as wings upon the yard arms.

STUFF, in commerce, a general name for all kinds of fabrics of gold, silver, silk, wool, hair, cotton, or thread, manufactured on the loom; of which number

are velvets, brocades, mohairs, satins, taffeties, cloths, serges, &c.

STUKELY (Dr William), a celebrated antiquarian, descended from an ancient family in Lincolnshire, was born at Holbech in 1687, and educated in Bennet college, Cambridge. While an undergraduate, he often indulged a strong propensity to drawing and designing; but made physic his principal study, and first began to practise at Boston in his native country. In 1717, he removed to London; where, on the recommendation of Dr Mead, he was soon after elected a fellow of the royal society: he was one of the first who revived that of the antiquarians in 1718, and was their secretary for many years during his residence in town. In 1729, he took holy orders by the encouragement of archbishop Wake; and was soon after presented by lord chancellor King with the living of All-Saints in Stamford. In 1741, he became one of the founders of the Egyptian society, which brought him acquainted with the benevolent duke of Montague, one of the members; who prevailed on him to leave Stamford, and presented him to the living of St George the Martyr, Queen Square. He died of a stroke of the palsy in 1765. In his physical capacity, his *Dissertation on the Spleen* was well received; and his *Itinerarium Curiosum*, the first-fruit of his juvenile excursions, was a good specimen of what was to be expected from his riper age. His great learning and profound researches into the dark remains of antiquity, enabled him to publish many elaborate and curious works: his friends used to call him the *arch-druid* of his age. His discourses, intitled *Palaeographia Sacra*, on the vegetable creation, bespeak him a botanist, philosopher, and divine.

STUM, in the wine-trade, denotes the unfermented juice of the grape after it has been several times racked off and separated from its sediment. The casks are for this purpose well matched or fumigated with brimstone every time, to prevent the liquor from fermenting, as it would otherwise readily do, and become wine.

STUPIDITY. The Greek word *μωροτης* corresponds most with our English word *stupidity* or *foolishness*, (in the common acceptation of it), which is, when reason is rendered somewhat defective. The immediate causes are, a deficiency of vital heat, or a defect in the brain. Stupid children sometimes become sprightly youths; but if stupidity continues to the age of puberty, it is hardly ever removed. If stupidity follows upon a violent passion, an injury done to the head, or other evident cause, if it continues long, it becomes incurable. But the stupidity which consists in a loss of memory, and succeeds a lethargy, spontaneously ceases when the lethargy is cured.

STUPOR, a numbness in any part of the body, whether occasioned by ligatures obstructing the blood's motion, by the palsy, or the like.

STUPPA,

best, as the grains of these powders are more perishable and brittle than those of sand. They will not therefore be employed, unless for the sake of evasion, or for want of sand: in this latter case, the finer powder ought to be washed away.

(x) " This and the next paragraph is inserted with a view to evasions, as well as to suggest the easier and cheaper methods which may be adopted in certain circumstances, by artists who understand the principles which I endeavoured to teach.

(y) " This practice is noticed, as the remedy which may be used for the defects arising from evasive measures, and as the method of giving spongy incrustations containing bone-ashes the greatest degree of hardness."

Stukely
||
Stupor.

STUPPA, or STURP, in medicine, is a piece of cloth dipped in some proper liquor, and applied to an affected part.

STURGEON. See ACCIPENSER.

STURMIUS (John), a learned philologist and rhetorician, was born at Sleida in Eifel near Cologne in 1507. He studied at first in his native country with the sons of count de Manderfcheid, whose receiver his father was. He afterward pursued his study at Liege in the college of St Jerom, and then went to Louvain in 1524. Five years he spent there, three in learning and two in teaching. He set up a printing-press with Rudger Rescius professor of the Greek tongue, and printed several Greek authors. He went to Paris in 1529, where he was highly esteemed, and read public lectures on the Greek and Latin writers, and on logic. He married there, and kept a great number of boarders; but as he liked what were called the *new opinions*, he was more than once in danger; and this undoubtedly was the reason why he removed to Strasburg in 1537, in order to take possession of the place offered him by the magistrates. The year following he opened a school, which became famous, and by his means obtained of Maximilian II. the title of an university in 1566. He was very well skilled in polite literature, wrote Latin with great purity, and was a good teacher. His talents were not confined to the school; for he was frequently intrusted with deputations in Germany and foreign countries, and discharged these employments with great honour and diligence. He showed extreme charity to the refugees on account of religion: He not only laboured to assist them by his advice and recommendations; but he even impoverished himself for them. He died in his 82d year, after he had been for some time blind. He published many books; the principal of which are, 1. *Partitiones Dialecticæ*. 2. *De Educatione Principum*. 3. *De Nobilitate Anglicana*. 4. *Lingue Latine resoluende Ratio*. 5. *Excellent Notes on Aristotle's and Hermogenæus's Rhetoric*, &c.

He ought not to be confounded with *John Sturm*, a native of Mechlin, and physician and professor of mathematics at Louvain, who also wrote several works.

STURNUS, the STARLING; a genus belonging to the order of passers. The beak is subulated, depressed, and somewhat blunt; the superior mandible is entire, and somewhat open at the edges; the nostrils are marginated above; and the tongue is sharp and emarginated. There are five species, the principal of which are,

1. The vulgaris, or flare. The weight of the male of this species is about three ounces; that of the female rather less. The length is eight inches three quarters: the breadth fourteen inches. Bill, in old birds, yellow. The whole plumage is black, very resplendent, with changeable blue, purple, and copper: each feather marked with a pale yellow spot. The lesser coverts are edged with yellow, and slightly glossed with green. The quill-feathers and tail dusky: the former edged with yellow on the exterior side; the last with dirty white. The legs of a reddish brown.—The flare breeds in hollow trees, caves of houses, towers, ruins cliffs, and often in high rocks over the sea, such as that of the Isle of Wight. It lays four or five eggs, of a pale-greenish ash-colour; and makes its nest of straw, small fibres of roots, and the like.

In winter, flares assemble in vast flocks: they collect in myriads in the fens of Lincolnshire, and do great damage to the fen-men, by roosting on the reeds, and breaking them down by their weight; for reeds are the thatch of the country, and are harvelled with great care. These birds feed on worms and insects; and it is said that they will get into pigeon-houses, for the sake of sucking the eggs. Their flesh is so bitter as to be scarce eatable. They are very docile, and may be taught to speak.

2. The cinclus, or water-ouzel, weighs two ounces and a half: the length seven inches one quarter: the breadth eleven: the bill is narrow, and compressed sideways: the eyelids are white; the head, cheeks, and hinder part of the neck, are dusky, mixed with rust-colour: the back, coverts of the wings, and of the tail, also dusky, edged with bluish ash-colour: the throat and breast white: the belly ferruginous, vent-feathers a deep ash-colour: the legs are of a pale blue before, black behind: the tail short and black, which it often flirts up as it is sitting.—This bird frequents small brooks, particularly those with steep banks, or that run through a rocky country. It is of a very retired nature, and never seen but single or with its mate. It breeds in holes in the banks, and lays five white eggs adorned with a fine blush of red. It feeds on insects and small fish; and, as Mr Willughby observes, though not web-footed, will dart itself after them quite under water. The nest is constructed in a curious manner, of hay and fibres of roots, and lined with dead oak-leaves, having a portico or grand entrance made with green moss.

STYLE, or STYTHE, in the eye. See CRITHE.

STYLE, a word of various significations, originally deduced from *stylus*, a kind of bodkin wherewith the ancients wrote on plates of lead, or on wax, &c. and which is still used to write on ivory-leaves and paper prepared for that purpose, &c.

STYLE, in dialling, denotes the gnomon or cock of a dial raised on the plane thereof to project a shadow.

STYLE, in botany. See there, p. 1296.

STYLE, in matters of language, a particular manner of expressing one's thoughts agreeably to the rules of syntax; or, as F. Buffier more accurately defines it, the manner wherein the words are arranged among themselves suitably to the genius of the language. See ORATORY, n° 99—121.

STYLE, in jurisprudence, the particular form or manner of proceeding in each court of jurisdiction, agreeably to the rules and orders established therein: thus we say, the style of the court of Rome, of chancery, of parliament, of the privy-council, &c.

STYLE, in music, denotes a peculiar manner of singing, playing, or composing; being properly the manner that each person has of playing, singing, or teaching; which is very different both in respect of different geniuses, of countries, nations, and of the different matters, places, times, subjects, passions, expressions, &c. Thus we say, the style of Palestrina, of Lully, of Corelli, of Handel, &c.; the style of the Italians, French, Spaniards, &c.

Old STYLE, the Julian method of computing time, as the

New STYLE is the Gregorian method of computation. See ASTRONOMY, n° 295.

STYLET, a small dangerous kind of poniard which

Stylices
Subject.

which may be concealed in the hand, chiefly used in treacherous assassinations. The blade is usually triangular, and so small that the wound it makes is almost imperceptible.

STYLITES, or **PILLAR SAINTS**, an appellation given to a kind of solitaries who spent their lives on the tops of columns, to be, as they imagined, the better disposed for meditation, &c. See ECCLESIASTICAL HISTORY, n° 79. The extremity of these columns were only three feet in diameter, with a kind of rail or ledge about it, that reached almost to the girdle, somewhat resembling a pulpit. The faquirs, or devout people of the east, imitate this extraordinary kind of life even to this day.

STYLO GLOSSUS,

STYLO-HYOIDEUS,

STYLO-PHARYNGEUS,

STYLOIDES,

STYPTIC, in pharmacy, medicines which by their astringency stop hæmorrhages, &c.

STYRAX, the **STORAX-TREE**; a genus of the monogynia order, belonging to the dodzændria class of plants. There is but one species, viz. the officialis. It is a native of Palestine, Syria, the islands of the Archipelago, and also grows plentifully in the neighbourhood of Rome. It rises with a woody stalk 12 or 14 feet high, sending out many ligneous branches covered with a greyish bark. The flowers come out from the sides of the branches upon footstalks, which sustain five or six flowers in a bunch; these have one very white petal, which is funnel-shaped, the lower part being tubulous and cylindrical, and the upper divided into five obtuse segments which spread open, not flat, but rather inclining to an angle.—It may be propagated by sowing the seeds in pots plunged in a moderate hot-bed, towards the latter end of summer. The gum of this tree is very fragrant, and is used in medicine. See **STORAX**.

STYX, (anc. geog.), a fountain dropping a deadly water, accounted sacred, between Monacris and Pheneus in Arcadia.—*Syx*, a lake of Thessaly, from which the river Titaresius ran, (Pliny).—A river of hell, (Homer, Hesiod, Virgil, Ovid); held in such veneration by the gods, that an oath of any god by it was inviolable; and whatever god presumed to break it was stripped of divinity, and debarred nectar for 100 years.

SUBALTERN, a subordinate officer, or one who discharges his post under the command and subject to the direction of another; such are lieutenants, sub-lieutenants, coronets, and ensigns, who serve under the captain.

SUBCLAVIAN, in anatomy, is applied to any thing under the arm-pit or shoulder, whether artery, nerve, vein, or muscle.

SUBDOMINANT, in music, a name given by M. Rameau to the fourth note of the tone, which of consequence is the same interval from the tonic when descending as the dominant in rising. This denomination arises from the affinity which this author finds by inversion between the minor mode of the subdominant and the major mode of the tonic.

SUBER, the **CORK-TREE**, in botany. See **QUERCUS**.

SUBJECT, a person under the rule and dominion

of a sovereign prince or state.

SUBJECT is also used for the matter of an art or science, or that which it considers, or whereon it is employed: thus the human body is the subject of medicine.

SUBINFEUDATION, was where the inferior lords, in imitation of their superiors, began to carve out and grant to others minuter estates than their own, to be held of themselves; and were so proceeding downwards in infinitum, till the superior lords observed, that by this method of subinfeudation they lost all their feudal profits, of wardships, marriages, and escheats, which fell into the hands of these mesne or middle lords, who were the immediate superiors of the terretenant, or him who occupied the land. This occasioned the stat. of Westm. 3. or *quia emptores*, 18 Ed. 1. to be made; which directs, that, upon all sales or feoffments of lands, the feoffee shall hold the same, not of his immediate feoffor, but of the chief lord of the fee of whom such feoffor himself held it. And from hence it is held, that all manors existing at this day must have existed by immemorial prescription; or at least ever since the 18 Ed. 1. when the statute of *quia emptores* was made.

SUBJUNCTIVE, in grammar. See **GRAMMAR**.

SUBLIMATE, a chemical preparation, consisting of quicksilver united with the marine acid. See **CHEMISTRY**, n° 251.

SUBLIMATION, in chemistry, the condensing and collecting, in a solid form, by means of vessels aptly constructed, the fumes of bodies raised from them by the application of a proper heat. See **CHEMISTRY**, n° 82.

SUBLIME, or **SUBLIMITY**. See **GRANDEUR**, and **ORATORY**, n° 111, 112.

SUBORDINATION, a relative term, expressing the degree of inferiority betwixt one thing and another.

SUBORNATION, in law, a secret, underhand, preparing, instructing or bringing in a false witness; and from hence *subornation of perjury* is the preparing or corrupt alluring to perjury. Subornation of witnesses we read of in the 32 Hen. 8. c. 9. And in procuring or suborning a witness to give false testimony in any court of record concerning lands or goods, the offender shall forfeit 40 l. or suffer imprisonment for half a year, stand on the pillory, &c. by 6th Eliz. c. 9.

SUBPENA, in law, a writ whereby common persons are called into chancery, in such cases where the common law hath provided no ordinary remedy; and the name of it proceeds from the words therein, which charge the party called to appear at the day and place assigned, *sub pena centum librarum*, &c. The subpoena is the leading process in the courts of equity; and by statute, when a bill is filed against any person, process of subpoena shall be taken out to oblige the defendant to appear and answer the bill, &c.

SUBPOENA ad testificandum, a writ or process, to bring in witnesses to give their testimony. If a witness on being served with this process does not appear, the court will issue an attachment against him; or a party, plaintiff or defendant, injured by his non-attendance, may maintain an action against the witness. See *Blackst. Com.* vol. III. p. 369.

SUBPOENA in Equity, a process in equity, calling on a defendant to appear and answer to the complain-

Subject

Subject.

Subrepti-
tious
Subulated.

ant's bill. See stat. 5th Geo. II. c. 25. which enacts, that where the party cannot be found to be served with a subpoena, and absconds (as believed) to avoid being served, a day shall be appointed him to appear to the bill of the plaintiff; which is to be inserted in the London Gazette, read in the parish-church where the defendant last lived, and fixed up at the Royal Exchange: and if the defendant doth not appear upon that day, the bill shall be taken *pro confesso*.

SUBREPTITIOUS, a term applied to a letter, licence, patent, or other act, fraudulently obtained of a superior, by concealing some truth which, had it been known, would have prevented the concession or grant.

SUBSCRIPTION, in general, signifies the signature put at the bottom of a letter, writing, or instrument.

In commerce, it is used for the share or interest which particular persons take in a public stock or a trading-company, by writing their names, and the shares they require, in the books or register thereof.

SUBSCRIPTION, in the commerce of books, signifies an engagement to take a certain number of copies of a book intended to be printed, and a reciprocal obligation of the bookseller or publisher to deliver the said copies, on certain terms.—These subscriptions, which had their rise in England about the middle of the last century, are now become frequent in France and Holland, but exceedingly more so of late among ourselves.

SUBSEQUENT, something that comes after another, particularly with regard to the order of time.

SUBSIDY, in law, signifies an aid or tax granted to the king by parliament, for the necessary occasions of the kingdom; and is to be levied on every subject of ability, according to the rate or value of his lands or goods: but this word, in some of our statutes, is confounded with that of customs. See TAX.

SUBSTANCE, something that we conceive to subsist of itself, independently of any created being, or any particular mode or accident. See METAPHYSICS, n^o 50, 52, 87—93, 137, 148, &c.

SUBSTANTIAL, in the schools, something belonging to the nature of substance.

SUBSTANTIVE, in grammar. See GRAMMAR.

SUBSTITUTE, a person appointed to officiate for another, in case of absence or other legal impediment.

SUBSTITUTION, in the civil law, a disposition of a testament, whereby the testator substitutes one heir for another, who has only the usufruct, and not the property, of the thing left him.

SUBTRACTION, or **SUBTRACTION**, in arithmetic, the second rule, or rather operation, in arithmetic, whereby we deduct a less number from a greater, to learn their precise difference. See ARITHMETIC.

SUBTRACTION, in algebra. See ALGEBRA.

SUBTERRANEAN, whatever is under ground: thus naturalists speak of subterranean fires, subterranean damps, &c.

SUBTILE, in physics, an appellation given to whatever is extremely small, fine, and delicate; such as the animal-spirits, the effluvia of odorous bodies, &c. are supposed to be.

SUBULATED, something shaped like an awl.

VOL. X.

SUCCEDANEUM, in pharmacy, denotes a drug substituted in the place of another, in medical composition.

SUCCESSION, in philosophy, an idea which we get by reflecting on that train of ideas constantly following one another in our minds when awake. See METAPHYSICS, n^o 61.

SUCCESSION, in law. See DESCENT.

SUCCESSION to the Crown. See HEREDITARY Right.

—From the days of Egbert, the first sole monarch of England, even to the present, the four cardinal maxims mentioned in that article have ever been held constitutional canons of succession. It is true, as Sir William Blackstone observes, this succession, through fraud or force, or sometimes through necessity, when in hostile times the crown descended on a minor or the like, has been very frequently suspended; but has generally at last returned back into the old hereditary channel, though sometimes a very considerable period has intervened. And, even in those instances where the succession has been violated, the crown has ever been looked upon as hereditary in the wearer of it. Of which the usurpers themselves were so sensible, that they for the most part endeavoured to vump up some feeble show of a title by descent, in order to amuse the people, while they gained the possession of the kingdom. And, when possession was once gained, they considered it as the purchase or acquisition of a new estate of inheritance, and transmitted or endeavoured to transmit it to their own posterity, by a kind of hereditary right of usurpation. See *Blackst. Com.* v. i. 197—216. From the historical view there given, it appears, that the title to the crown is at present hereditary, though not quite so absolutely hereditary as formerly: and the common stock, or ancestor, from whom the descent must be derived, is also different. Formerly, the common stock was king Egbert; then William the conqueror; afterwards, in James I.'s time, the two common stocks united; and so continued till the vacancy of the throne in 1688: now it is the princess Sophia, in whom the inheritance was vested by the new king and parliament. Formerly, the descent was absolute, and the crown went to the next heir without any restriction: but now, upon the new settlement, the inheritance is conditional; being limited to such heirs only, of the body of the princess Sophia, as are Protestant members of the church of England, and are married to none but Protestants.

And in this due medium consists the true constitutional notion of the right of succession to the imperial crown of these kingdoms. The extremes between which it steers are each of them equally destructive of those ends for which societies were formed and are kept on foot. Where the magistrate, upon every succession, is elected by the people, and may by the express provision of the laws be deposed (if not punished) by his subjects, this may found like the perfection of liberty, and look well enough when delineated on paper; but in practice will be ever productive of tumult, contention, and anarchy. And, on the other hand, divine indefeasible hereditary right, when coupled with the doctrine of unlimited passive obedience, is surely of all constitutions the most thoroughly slavish and dreadful. But when such an hereditary right as our laws have created and vested in the royal stock, is closely inter-

41 Q woven

woven with those liberties which are equally the inheritance of the subject; this union will form a constitution, in theory the most beautiful of any, in practice the most approved, and, we trust, in duration the most permanent.

SUCCORY, in botany. See CICHORIUM.

SUCCOTH, (anc. geog.); a place beyond Jordan, over-against Zortan on this side; so called from Jacob's fixing his tents there.—Another *Succoth*, the first mansion of the Israelites after their departure from Ramefes towards the Red Sea.

SUCCUBUS, a term used by some writers for a dæmon who assumes the shape of a woman, and as such lies with a man; in which sense it stands opposed to *incubus*, which was a dæmon in form of a man, that lies with a woman. But the truth is, the succubus is only a species of the night-mare. See MEDICINE, n° 430.

SUCKER, in ichthyology. See CYCLOPTERUS.

SUCKERS, in gardening, the same with OFFSETS.

SUCKING-FISH. See ECHENEIS.

SUCKLING (Sir John), an English poet and dramatic writer, was the son of Sir John Suckling, comptroller of the household to king Charles I. and born at Witham in Essex in 1613. He discovered an uncommon propensity to the acquiring of languages, inasmuch that he is reported to have spoken Latin at five years of age, and to have wrote it at nine. When he was grown up, he travelled; but seems to have affected nothing more than the character of a courtier and fine gentleman; which he so far attained, that he was allowed to have the peculiar happiness of making every thing he did become him. In his travels he made a campaign under the great Gustavus Adolphus; and his loyalty, if not his valour, appeared in the beginning of our civil wars: for, after his return to England, he raised a troop of horse for the king's service, entirely at his own charge; and mounted them so completely and richly, that they are said to have cost him 12,000*l*. This troop, with Sir John at its head, behaved so ill in the engagement with the Scots, upon the English borders, in 1639, as to occasion the famous lampoon composed by Sir John Mennis; "Sir John he got him an ambling nag, &c." This ballad, which was set to a brisk tune, was much sung by the parliamentarians, and continues to be sung to this day. This disastrous expedition, and the ridicule that attended it, was supposed to have hastened his death; being seized by a fever, of which he died, at 28 years of age. He was a sprightly wit, and an easy versifier, but no great poet. His works, consisting of a few poems, letters, and plays, have nevertheless gone thro' several editions.

SUCTION, the act of sucking or drawing up a fluid, as air, water, milk, or the like, by means of the mouth and lungs; or, in a similar manner, by artificial means. See PNEUMATICS and HYDROSTATICS.

SUDATORY, a name given by the ancient Romans to their hot or sweating rooms; sometimes also called *Laconica*.

SUDORIFIC, an appellation given to any medicine that causes or promotes sweat.

SUESSIONES, a branch of the Remi, a people of Gallia Belgica, (Pliny); called sometimes *Suessones*, in the lower age *Suessi*; situated between the Remi to

the east, the Nervii to the north, the Veromandui to the west, and the Meldæ to the south, in the tract now called *le Soissonois*.—*Suessiones*, *Suessones*, and *Suessine*, the name of their city in the lower age; thought to have been formerly called *Nevidunum*, (Cæsar.) Now *Soissons*.

SUET, SEVUM, or *Sebum*, in anatomy, the solid fat found in several animals, as sheep, oxen, &c. but not in the human species. See the article FAT.—It is of the sebum that tallow is made. See TALLOW.

SUETONIUS TRANQUILLUS (Caius), a famous Latin historian, was born at Rome, and became secretary to the emperor Adrian about the 118th year of the Christian æra; but that post was taken from him three years after, when several persons fell under that prince's displeasure for not showing the empress Sabina all the respect she deserved. During his disgrace he composed many works, which are lost. Those now extant are his History of the XII first Emperors, and a part of his Treatise of the illustrious Grammarians and Rhetoricians. Pliny the Younger was his intimate friend, and persuaded him to publish his books. His History of the XII Roman Emperors is very much commended by most of our learned humanists. He represents, in a continued series of choice and curious particulars, without any digressions or reflections, the actions of the emperors, without omitting their vices, which he exposes with all their deformity, and with the same freedom mentions the good qualities of the very same persons; but the horrid dissoluteness and obscene actions he relates of Tiberius, Caligula, Nero, &c. have made some say, that he wrote the lives of the emperors with the same licentiousness with which they lived. The edition of this history procured by Grævius at Utrecht in 1672, with the excellent Commentaries of Torrentius and Casaubon, and the notes of some other learned critics, is much esteemed. That edition was reprinted in 1691.

SUEVI, the Catti or Chatti of Cæsar, (Strabo); placed on the Rhine: the reason of Cæsar's calling them thus does not appear, though considerably distant from the proper Suevi or Alemanni.

SUEVI, (Tacitus); a common name of the people situated between the Elbe and the Vistula, distinguished otherwise by particular names; as in Ptolemy, *Suevi Angeli*, *Suevi Sennones*.

SUEVUS, (anc. geog.) a river of Germany; thought to be the same with the Viadrus or Oder, emptying itself at three mouths into the Baltic, the middlemost of which is called *Swine* or *Swene*; which last comes nearer the name *Suevius*.

SUEZ, a small city, from which the isthmus that joins Africa with Asia hath its name. It stands about 30 hours east from Cairo, by the road called *Tauriche Beni Israel*, i. e. the road of the children of Israel, at the bottom of the Heroopolitan Gulph, or western branch of the Red Sea; and has about 200 houses, and an old castle. Here also is a small haven, but so shallow that ships of any burden cannot get into it; however, there is a good road by it, where they can ride safely and at ease. The greatest inconvenience of the place is, that it has no sweet water nearer than four or five miles. We are even told, that there are not above half a dozen wells betwixt Cairo and Mecca, at least in the road the pilgrims go, which lies to the northward.

Suez
||
Suffolk.

northward of this, and even these are bitterish and brackish. Suez was formerly a place of great trade; but since the way to the East Indies by the Cape of Good Hope hath been discovered, it hath been upon the decline. The place on the west coast of the gulph, where the children of Israel are supposed to have entered it, is called *Badeah*, about six miles to the north of Cape Korondel, on the other side of the gulph, as we are informed in a letter from the ingenious Edward Wortley Montague, F. R. S. to Dr Watfon, containing an account of his journey from Cairo to the Written Mountains in the desert of Sinai. Opposite to *Badeah* is a strong current, which sets to the opposite shore, about south-east, with a whirlpool called *Birque Pharaone*, the well or pool of *Pharaoh*, being the place where his host is said to have been destroyed. We are told by the same gentleman, that the Egyptian shore from Suez to *Badeah* is so rocky and steep, that there was no entering upon the gulph but at one of these two places; that it is high water in the gulph always when the moon is at her meridian height; that at Suez it flows six feet; that the spring-tides are nine feet, and in the variable months, from the beginning of November to the end of April, sometimes twelve; that, from the beginning of May to the beginning of October, a northerly wind generally rises and goes down with the sun, which is often very strong; that this wind never fails in these months, unless there be some violent storm; that the rest of the year the winds are variable, and when they blow hard at south south-east, set up the sea through the narrow strait of *Babel-Mandel*, and up this western branch or gulph, through its mouth, between *Gebel El-Zait* on the west, and the southernmost point of the Bay of Tor on the east, where it is not above 12 or 14 miles over. This wind, it is probable, hindering the water from going out, is the occasion of the extraordinary increase in the spring-tides. The Egyptian, Western, or Thebaic shore, from *Badeah* southward to opposite Tor on the eastern shore, is all mountainous and steep; and at *Elim*, the northernmost point of the bay of Tor, ends the ridge of mountains which begin on the eastern shore of this western branch at *Korondel*.

SUFFOCATION, in medicine, the privation of respiration or breathing. See the articles *DROWNING*, *HANGING*, &c.

SUFFOLK, a county of England. Its name is contracted from *Southfolk*, so called from its situation in regard to Norfolk. It is bounded on the west by Cambridgeshire; on the south by Essex, from which it is parted by the river Stour; on the east, by the German ocean; and on the north by Norfolk, separated from it by the lesser Ouse and the Waverley. It is upwards of 40 miles in length; about 25, at a medium, in breadth; and 156 in circumference. It contains 22 hundreds, 32 market-towns, 275 parishes, upwards of 34,000 houses, and more than 200,000 inhabitants. The whole is divided into two parts; viz. the liberty of St Edmund, and the *Geldable*; the former of which contain the west parts of the county, and the other the east; and there is a grand jury for each at the assizes. The air is reckoned as wholesome and pleasant as any in the kingdom; nor is it otherwise upon the sea coast, which is dry and sandy, and free

from salt-marshes. The soil, except to the west and upon the sea-coast, is very rich, being a compound of clay and marle. Towards the sea there are large heaths and tracts of sand; but these produce hemp, rye, and pease, and feed great flocks of sheep. About Newmarket, the soil is much the same; but in high Suffolk or the woodlands, besides wood, there are very rich pastures, where abundance of cattle are fed. In other parts of the county, as about Bury, there is plenty of corn. As this county is noted for the richness of its pastures, so is it for butter and cheese, especially the former, which is said to be extraordinary fine; so that being packed up in firkins, it is sold for all uses both by sea and land, and conveyed to many parts of England, especially to London. The inland parts of the county are well supplied with wood for fuel, and those upon the sea-coast with coals from Newcastle. The manufactures of the county are chiefly woollen and linen cloth. It lies in the diocese of Norwich; has two archdeacons, viz. of Sudbury and Suffolk; gives title of earl to a branch of the Howards; sends two members to parliament for the county; and two for each of the following places, Ipswich, Dunwich, Orford, Aldborough, Sudbury, Eye, and St Edmund's-Bury. The county is extremely well watered by the following rivers, which either traverse its borders or run across into the German ocean, viz. the lesser Ouse, the Waverley, the Blithe, the Deben, the Orwell or Gipping, and the Stour.

SUFFRAGAN, an appellation given to simple bishops with regard to archbishops, on whom they depend, and to whom appeals lie from the bishops courts.

SUFFRAGE, denotes a vote given in an assembly, where something is deliberated on, or where a person is elected to an office or benefice.

SUFFRUTEX, among botanists, denotes an under-shrub, or the lowest kind of woody plants, as lavender.

SUGAR, in natural history, is properly the essential part of the sugar-cane.

The sugar-cane grows naturally in both Indies; where it is likewise cultivated for its juice.

In the manner of their growth, form of their leaves, and make of their panicle, the sugar-canes resemble the reeds which grow in wet marshy grounds in England or elsewhere; except that the canes are far larger, and, instead of being hollow as the reeds, are filled with a white pith, containing the sweet juice or liquid, which stamps such an amazing value upon these plants. The intermediate distance between each joint of a cane is of different lengths, according to the nature of the soil, richness of the manure, and different temperature of the weather during its growth; it seldom exceeds, however, four inches in length and an inch in diameter. The length of the whole cane likewise depends upon the above circumstances. It generally grows to perfection in about fourteen months, when its height, at a medium, is about six feet, sometimes more, sometimes less. The body of the cane is strong, but brittle; of a fine straw-colour, inclining to a yellow. The extremity of each is covered, for a considerable length, with many long grassy leaves or blades, sharply and finely sawed on their edges; the middle longitudinal rib being high and prominent.

The bottom part of the sugar-cane top is about the thickness of one's finger; and as it contains a good deal

Suffragan
||
Sugar.

deal of the natural sweetness of the plant, it is usually cut into pieces of an inch and a half long, and given to the fiddle-horses in the West Indies. It is very nourishing food, and fattens them apace. The mill-horses, mules, and asses, are likewise fed, during crop-time, on sugar-cane tops and the skimming of the sugar-coppers; which last must be administered sparingly at first, for fear of griping, and perhaps killing them.

The canes, when ripe, are squeezed between the iron-cased rollers of wind-mills or cattle-mills. The juice thus pressed out, is boiled first in a very large copper or cauldron, being mixed with a very small quantity of lime. In default of lime, a strong ley of ashes will answer the same purpose, and was indeed originally used, though the first is generally thought to have greater efficacy. The benefits arising from either substance are probably to be attributed, in great measure, to their alkaline qualities. The sugar-cane, when ripe, is of all plants the sweetest; there is, however, a latent acid still lurking in the juice, as is manifest by its turning sour if suffered to remain unboiled any considerable time after expression. The addition, therefore, of white lime, which the planters call *temper*, is necessary to destroy, in a great measure, the remaining acid, and to form a neutral salt.

Lime, or the strong ley just mentioned, likewise serves to carry off all impurities from the liquor. When the quantity of temper is duly proportioned, if the liquor is put into a glass, the immediate separation will follow; the fordes settle at the bottom, and the juice remains transparent at top. On the other hand, if there is a deficiency of temper, the separation will be imperfect; and if there is a superfluity, there will be no separation at all.

After the lime is mixed with the juice in the copper or cauldron, the impurities in question being no longer intimately united with the boiling liquor, and being forced about with the heat of the fire, are easily entangled in a viscous tough substance, naturally in the cane-juice, with which they rise to the top of the copper, forming a thick tough scum.

The clarification of the liquor, as far as is done in the first copper, is perfected after the more gross scum is taken off; the remaining impurity, as the liquor boils, is skimmed off from the four or five remaining coppers, into which the liquor is successively poured; each of the coppers being gradually less, as containing a less quantity of liquor.

In its passage to the fourth copper, the liquor is strained through a thick woolen cloth, where it leaves all the remaining impurities that had escaped the summer.

After this a light white scum is taken off; and when this ceases to arise in any considerable quantity, and the liquor, by long boiling, becomes more of a syrup than a thin liquid, it is then poured into the first tache, and from this to a lesser, till it is conveyed to the last. When it has here attained the due consistence necessary to become sugar, it may be asserted, says Hughes, from whom this account is chiefly extracted, that no more than a seventh part of the whole remains; which diminution is occa-

sioned by the impurities being skimmed off, and the watery particles evaporated.

From this last stage it is conveyed, whilst of the consistency of a thick granulated syrup, into a large brass cooler, where it shoots into crystals, which are the genuine and essential salts of the plant; these are forwarded by gently stirring the whole mass, by which means the air is admitted to every part, and the particles of sugar disengage themselves from the clammy substance, which is termed *melasses*.

When it has grained or crystallized, it is removed from the cooler into pots or moulds, which are earthen, and of a pyramidal form, containing from eight to thirteen gallons.

About twenty-four hours after the sugar is potted, the small round hole in the bottom of each pot is unstopped, and the pots put upon earthen jars, containing about four gallons each: into these vessels the *melasses* drain from the sugar; which, in this degree of perfection, is called *muscavado*, and is fit for exportation in a month, or sooner.

From the abovementioned skimmings, mixed with a quantity of water and *melasses*, and fermented, is extracted that spirituous liquor called *rum*; and from the great quantity of oil in the cane-juice, which is transmitted in abundance to the rum, proceeds the excellency of that spirit, compared with brandy. The latter wanting this oiliness, stimulates and lacerates the coats of the stomach; whereas the former, if meliorated by age and drank moderately, serves, by its oiliness, to lubricate and preserve the bowels. See *RUM*.

The most natural, and perhaps the only proper, method of producing canes, is by suckers, or with the tender tops of old canes. These being cut into pieces of about a foot long, planted in holes of about six inches deep and two feet wide, and covered with good manure, each piece will produce from its roots a great number of canes.

But it may not be unacceptable to give a more particular account both of the cultivation of the plant, and the process of sugar-making, according to the most approved methods.

1. *Best Method of cultivating Sugar-canes.*—In *Riff Martin's Essay on Planter'ship*, soils where canes require most age, half the quantity of land intended for the crop should be planted in September; but in hot loose soils in October, and November; and the whole planting-season should conclude with the month of January or February (A), when the tops of the first canes cut may furnish the last pieces planted. By strict observance of this method, the canes will be at full maturity in the proper season for yielding most sugar, which is from the 1st of January (if the weather permits) to the 29th of July. But by grinding later, we hazard not only the destruction of our wind-mills by hurricanes, but make bad sugar, at infinite expence of time and labour, both of negroes and cattle, when the juice of the canes becomes weak and waterish. There is not therefore a greater error in the whole practice of planter'ship, than to make sugar or to plant canes at improper seasons of the year; for, by mismanagements of this kind, every succeeding crop is put out of regular order.

The land being well manured and mellowed by fallowing,

(A) In light luxuriant soils, canes planted in April or May often produce largely; but it seems not prudent to delay so long, for fear of a disappointment by drought.

Sugar.

lowing, let it be lined into spaces of four feet distance, and then holed either backwards or sidewise (a) as the manager thinks best; taking particular care that the cane-holes be made square at the bottom, and heaping the banks high, so as to take up little space. After holing, the land should lie in that posture until every little lump crumbles into fine mould, and then be planted before weeds spring up in any great abundance; for if planting in due time is neglected, the soil subsides, grows compact again, and defeats much of all the former tillage. The land being thus holed and mellowed by fallowing, let two good plants be put into each hole at equal distance from the centre; for if many plants be put into an hole, the sprouts will rise too plentifully, so as to hinder each other's growth, and produce very small spindling canes, which can yield but little sugar; for sugar-canes require more air and sun-shine than most other vegetables.

The plants being thus placed in each hole, with the eyes horizontally, must be covered, in loose dry soils, not above two inches deep; but in stiff ground one inch is sufficient, leaving the banks to be added by small accessions at every weeding, and the one-third to be reserved for covering the stools of the ratoons, which will much forward their growth: but let the common custom of drawing mould into hillocks round each stool of young canes be avoided; because that practice breaks the young superficial fibres, and leaves them bare to perish by the scorching sun. Stiff or clay-soils, if well drained in the manner before directed, may be planted hollow, as the lightest, to the same advantage; for covering the stools of ratoons with one-third of the bank left for that purpose, is preferable to hoe-ploughing alone. As such level stiff soils, free from stones, are most improveable by the plough, the husbandman's chief care should be to plough the land into ridges, rising gradually from the sides to the centres: for then the rain-water will pass off with ease through the furrows, and save all the hand-labour of draining, except small trenches round each field, through which the water may pass gently without washing away the mould: for where all preceding arts are practised to pulverise the soil, peculiar care must be taken to prevent its washing away by floods of rain, or the land will soon become barren.

It has been suggested before, that two good plants are sufficient for an hole of the dimensions above-mentioned; but in smaller holes, one only is used by some judicious planters with good success. Drawn plants from ratoon-sprouts of six or eight months old are very good; and in some respects preferable to the tops of old canes, as having short joints, and of course more eyes, and plumper than the others. It is, however, generally observed, that the tops of old canes are the hardiest plants, capable of bearing the extremity of dry or wet weather better than any other; but if the fibrous roots of drawn plants are cut off, no man will have reason to complain. To use the tops of grown canes for the last pieces planted, from January to May, is very good management: but drawn

Sugar.

plants will answer perfectly well at all other seasons of the year; and of these an abundance may be provided by a right forecast, if unseasonable droughts do not prevent; and good allowance must be made for such events. By that the planter divides his plantation into three, four, or five equal parts, in proportion to his strength of hands and cattle, allowing one third, fourth, or fifth part to be planted every year: and if he contrives to cut plants always from a contiguous field, much cartage in wet weather will be prevented; much of his negroes time saved in passing from one distant field to another, and still more if mules are employed to carry plants.

But after all this care in the preceding process, sure disappointment will attend the planter who neglects timely weeding his young canes; which, by once being over-run by weeds, will be so flinted as never to become very good by any subsequent helps: let therefore every manager be as careful and nice in preserving his canes clean from all weeds, as the florist is of his parterre; postponing every other work when that calls for his labour. And if instead of scraping up these weeds with common hoes, according to the present practice, he could employ the Kentish hoe-plough, infinite hand-labour may be saved: or if the nature of his soil be stiff or stony, so that the hoe-plough cannot be used, it is very probable, that by digging all weeds into the soil with spades or hoes, and loosening it by that means, as gardeners do in England, the sugar-canes would be so invigorated, as to recompense the labour beyond our present conception. No devastation by that pernicious insect called the *blast* could then take place. All the schemes hitherto proposed for curing that evil are vain impracticable speculations, or a waste of time and labour to little purpose. But if it be a fact, that the blast commits most ravage in poor land, and affects not the luxuriant sugar-canes of a rich soil, the cure of the evil is certain and obvious. Manure and cultivate your lands so as to render them rich and fruitful, and you will prevent the blast (c); more especially if (according to the English husbandry) the produce is changed, by planting potatoes, yams, or corn, in dry soils, and eddoes or potatoes in stiff lands: for by these arts the planter may be sure (if favoured by natural seasons) of canes that will reward his labour by plentiful crops of sugar; and it must then be his interest, by skill and care, to make it as good as possible; which shall be the subject of the following section, after having given some new directions for the cultivation of ratoons.

It has been observed above, that the stools or roots from whence canes are cut, are apt to corrupt at the parts left above ground, and these of course canker the whole stool: hence it is that ratoons, or canes springing from those stools, are seldom very good, except in very rich soils; and therefore some good planters, to prevent those stubs above ground, draw their canes for sugar from the roots, which we believe effectual, but very laborious: but by a late experiment, it is found a less laborious method, after uncovering,

(b) If the holes are made four feet wide one way, and five feet from bank to bank, the bottom of the hole will be a true square.

(c) It is, however, certainly a mistake to say, that the blast infects not the canes of a rich soil. The contrary is known to be true by experience: and therefore the best and only effectual cure is wiping the blades by wet cloths, until wet weather completes the cure.

vering the stools, by taking off the trash, so soon as the canes are carried out of the field, to cut by a sharp hoe all the heads of the cane-stools, three inches below the surface of the soil, and then fill the hole with fine mould; by which means all the sprouts rising from below derive more nutriment, and grow with vigour far beyond expectation.

2. *Best Method of making Sugar.* In making good sugar, there is a great variety of incidents, of which if any one fails, the end is absolutely frustrated: the wife planter, therefore, must be very attentive to every minute step throughout the whole process. It must be his first care to keep his mill in perfect good order, so that common accidents may not retard his crop in the season when canes yield the most and best sugar: every part of his works must be very clean, and his coppers hung so judiciously, as to boil perfectly well with little fuel; for nothing contributes more to the making of good sugar than quick boiling, after the cane-juice is well clarified. To this end, therefore, the great coppers, or first clarifiers, should be hung singly, or to separate fires, and pinned about 10 or 12 inches from the bottom, that the scum may be separated by slow degrees, and kept floating upon the surface long enough to be taken off perfectly: for if the liquor be suffered to boil with violence, the scum will incorporate again with it, and never after be separable but by the refining-pan; and thus dark foul sugar is made of that cane-juice which might have produced, by good management, fine bright sugar of much greater value at the market. This is a point of great importance to every planter, whose profit depends much upon the goodness of his sugar; for the worst pays the same freight, duty, and charges, as the very best.

The cane-juice, therefore, after being strained at the mill through a brags-wire sieve, ought to run down to the boiling-house in spouts lined with lead, to preserve it from tainting (b); and being let into the first clarifier, must be there boiled over a moderate fire until perfectly freed from all scum; afterwards it must be strained through a thick coarse blanket, and then boiled to sugar with all possible celerity. But let the coppers be ever so judiciously hung, the liquor cannot be boiled with due quickness, unless the manager takes peculiar care to provide great plenty of dry fuel or mill-trash. The good planter, therefore, will lay up a stock of brush-wood cut from the hedges of his boundary before the crop begins; or, if he has plenty of wood, enough to serve the uses of his mill-house; by which means he may soon lay up a large fund of mill-trash, and pack it either in ricks or in a large trash-house, that the progress of his crop may not be hindered by every shower, or his sugar spoiled by dull fires.

The judicious boiler's next care is to provide quicklime of the best sort to temper his liquor; for otherwise the sugar will be clammy, than which it cannot have a worse quality. That defect in sugar arises from two very different causes; for slow boiling and bad temper-lime have the very same effect. The lime made from marble, or any other land lime-stones, is the strongest, and preferable to that made from white fa-coral; and the newer it is from the kiln, the better:

for by keeping it in the tightest casks for any long duration, some of its good qualities evaporate; and therefore, in the daily use of it, the air must be excluded.

It is impossible to prescribe exactly the quantity of lime necessary for every sort of cane-juice. It has, however, been observed, that five ounces of the best quicklime are sufficient for 100 gallons of good cane-juice. Instead of increasing the quantity of lime, Mr Martin advises the use of powdered alum; one quarter of an ounce of which, or less, to a strike of sugar, will give both firmness and largeness of grain: experiment will soon determine whether more or less alum will be requisite. It is a good rule in general to give a full quantity, which can only be determined precisely by the first sugar made; but by dipping a skimmer into the tach when the liquor is boiled to near a syrup height, and by giving it two or three quick twirls, and then hanging the edges of it downward, an observing eye will discern the liquor falling from the skimmer in glassy flakes. If these hang long, the liquor is not sufficiently tempered; but if short, breaking near to the edge of the skimmer, it is tempered enough. When cane-juice is tainted by excessive drought, so as to make foxy bad sugar, there are various methods in use of extracting the taint. Among these, Mr Martin never found any so effectual as by high tempering the liquor; and, when it is boiled to a thick syrup, throwing into the tach two or three gallons of fair water, which, by sudden solution, throws up the taint or viscous scum (consisting of the lightest particles) upon the surface; from whence it must be skimmed off with all expedition, and reserved for distillation. This is a very effectual method of making strong bright sugar from cane-juice very much tainted, provided it be rich or at full maturity; but if the sugar-canes are much tainted while the juice is waterish, all attempts to make good sugar of it are vain and fruitless: for then it is fit only for distillation. Indeed a strong or large-grained sugar cannot by any art be made from waterish juice, even though untainted by drought; and therefore, when the planter finds his cane-juice of that sort, let him strip his canes from all the trash, suffering them to stand for six weeks exposed to the air and sun; and he will find that labour amply recompensed by a large product of very good sugar, as experience has often evinced.

After duly tempering the cane-juice with the strongest quicklime, clarifying it over a moderate fire, and straining it as before described, let it be boiled with the utmost quickness to a middling sugar-height, which will give it a large grain, and a fair colour, never-failing qualities to procure the best price at market. This art of boiling sugar, though of the greatest importance to every planter, is generally least understood either by overseers or their masters; but that point of greatest consequence is trusted wholly to the skill of negro-boilers, who indeed arrive by long habit to some degree of judgment by the eye only. To that eye-art Mr Martin says he has attended with all diligence, but could never acquire a critical exactness: for the sight, of all the other senses, is most fallible and subject to deception: a little more or less butter
through

(b) Mill cisterns, and all receivers through which cane juice passes, should be lined with lead: because wood soon taints it; and the greatest artift cannot make the best sugar with tainted juice.

Sugar.

thrown into the tach will alter the whole appearance, and often deceive the most attentive and experienced eye; and no doubt there are other causes less observable, which produce the like effect; and therefore he recommends boiling by the *touch* also, which is abundantly more certain, as two witnesses are better than one.

This art of boiling by the touch is called *taking a proof*; but to impart by words the knowledge of it is as impossible as to teach any other mechanic art, which can be attained by practice only. However, the method of doing it is by a pan-stick, of four feet and an half long, eighteen inches of which is made rounding for the grasp of the left hand, and three feet flatwise, about two inches broad, and an inch thick: by immersing this pan-stick into the liquor when boiled to a pretty thick consistence, it will be smeared; upon which the boiler puts his right thumb, taking up a sufficient quantity, and touching then the thumb with the fore-finger, draws the liquid sugar like a thread at the instant when the heat is going off: this thread, when broken, will shrink from the thumb to the suspended fore-finger in several lengths, as the boiler intends; for the different lengths at which this thread hangs to the fore-finger determine precisely the different degrees of boiling sugar; and these degrees are proportioned to the several sizes of moulds, or sugar-pots, in which it is cured. The denominations by which these degrees are determined by refiners, are, *piece*, *lump*, and *loaf-height*. *Piece-height* is the highest degree, and suited to the moulds of the largest size, which contain about nine gallons: the thread of *piece-height* is about three inches long: that of *lump-height*, suitable to moulds of half the former sizes, is when the thread stands at about an inch from the suspended fore-finger: and *loaf-height*, suitable to the smallest moulds, is determined by the thread of a quarter of an inch long from the suspended finger: and this *latter proof* is generally most suitable to the planter's purposes of making muscovado-sugar; which ought to be of a large grain, well separated from melasses. It has been said above, that the boiler must take a sufficient quantity of the liquid sugar upon his thumb, to make an exact proof. That sufficiency cannot be expressed in words precisely; but must be just enough to allow the drawing of a thread, and not more; for that will occasion some deception. In like manner, if the thread is drawn any other time than at the critical moment when the heat of the liquid sugar goes off the thumb, the boiler will be deceived; for, if the liquid sugar is either too hot or too cold when drawn into a string, it will vary the appearance. In taking proof, the young learner must expect to blister his thumb; but, to gave him as little pain as possible, when he takes up the liquid sugar, let him observe to keep his finger and thumb nimbly moving from and to each other in gentle contact, and then draw the string at that instant when the intense heat is going off; by which means he will save his thumb from blistering, and obtain an exact proof, according to the rules above prescribed.

Sugar.

The method of boiling muscovado-sugar is below loaf-height (π); and if then it is cooled with quickness in a broad superficies, and in a wooden cooler, the sugar will be of a larger grain than if cooled in a deep or copper vessel. But if the sugar is intended to be cured in pots or earthen moulds, it must be cooled in copper or deep wooden coolers, that it may be conveyed from thence into the pots while in the state of a thick liquid. This will occasion the grain of sugar to be smaller, (and more especially if judiciously stirred while in the cooler), which is an advantage to the colour of clayed sugar: for a multitude of surfaces will reflect more rays of light, and consequently appear whiter, than larger particles, which have fewer surfaces. For that reason the most expert planters of Barbadoes generally boil their sugar higher than most other people; but whether to so much profit, must be determined by future experience: for if a much less quantity of very white sugar is obtained by boiling high, then, by the contrary method, the question is, whether the greater price is an adequate recompence for so great a loss of weight. In Mr Martin's opinion, it is not: however, it is worth the trouble to determine that point by exact weight and measure. In such computations the refined Barbadoes managers exceed all our islanders.

The quantity and thinness of the clay-batter must be exactly proportioned, *not to the quantity of sugar* so much as to the degree of height to which it is boiled, which the *face* or surface of the sugar in each pot must determine: for if the crust breaks near the centre, the sugar is high-boiled, and will require a thinner batter; and so, *vice versa*, the nearer to the edge of the pot the surface cracks, the thicker must be the clay: for clay-batter is only the means of filtering the water through the sugar by easy degrees, so as to wash the grains from all the yellowness, or tinge of melasses, without dissolving the smallest particles. In this proportion, therefore, consists chiefly the art of claying, not to sink the pot of sugar by a double clay lower from the brim than five inches, and yet to whiten the whole mass alike to the bottom. But this cannot be effected without great judgment in boiling equally; and in separating the pots into several classes, so as to clay each parcel in a manner suitable to the degree of boiling: for want of this art it is that a planter may grow poorer by claying his sugar, than if he makes only plain muscovado: for the loss of sugar dissolved into melasses by claying injudiciously, cannot be compensated by converting it into rum. He therefore who proposes to clay sugar to advantage, must first learn the art of boiling by the *touch*, as the only criterion of boiling to a degree of exactness: he must learn also all the other process of halling and stirring the sugar after it is filled into the pots, by which small errors in boiling may be in some measure rectified. The same skill is requisite to boil sugar which is intended to be cured in pots, *without being clayed*; and therefore that practice is very unprofitable: for though sugar properly boiled will cure best in pots, yet if there be the least error in boiling,

(E) That is the greatest height for rich cane-juice; but when waterish, it will be high enough when a thread can be drawn.—It is a general maxim, that the weak cane-juice must be tempered very high and boiled low. The former is absolutely false; for a due temper must be observed: to boil it very low, is right, and that is a candy height.

'boiling, it will occasion the sugar to be of a very small grain, as is generally the case of Jamaica-sugar. For if the same sugar, which is of a small grain, had, by being put into pots, been cooled with quickness in a broad wooden cooler, and cured in hogheads, the grain would have been much larger, as a single experiment will evince. But if, in conformity to old customs, a manager will choose to cure in pots, let him cool his sugar in a shallow broad cooler, till it becomes very thick, and only liquid enough to be taken up with a ladle, and put into the pots: for by that means he will have a much larger-grained sugar, than by the practice of putting it hot into pots. It is a common practice to stir hot sugar once or twice after being put into the coolers; which is a sure means of breaking the grain, at the very instant while the sugar is granulating.

3. *Refining of Sugar.*—Sugar is afterwards refined from the coarse state in which it generally comes from abroad, to various degrees of purity by new solutions, and is sold at different prices, and under different names, according to the degree of purity it is brought to. Our sugar-refiners first dissolve it in water, then clarify the solution by boiling with whites of eggs and despumation; and after due evaporation pour it into moulds; where the fluid part being drained off, and the sugar concreted, its surface is covered with moist clay as before. The sugar thus once refined, by repetition of the process, becomes the double-refined sugar of the shops.

The *candy-sugar*, or that in crystals, is prepared by boiling down solutions of sugar to a certain pitch, and then removing them into a hot room, with sticks placed across the vessel for the sugar to shoot upon: and these crystals prove of a white or brown colour, according as the sugar used in the process was pure or impure.

SUGAR from different Plants.—In some parts of North America, particularly in Canada, a kind of sugar is prepared from the juice which issues upon wounding or boring certain species of the maple-tree, one of which is named from hence the *sugar-maple*; as also from the wild or black birch, the honey-locust, and the hickory. The maple is most commonly made use of for this purpose, as being the richest, and as best enduring the long and severe winters of that climate. The juice is boiled down, without any addition, to a thick consistence; then taken off from the fire, kept stirring till its heat is abated, and set in a cold place; where the sugar quickly concretes into grains, resembling common brown powder-sugar.

The trees are tapped early in the spring, about the time that the snow begins to melt. It is observable, that when the weather begins to grow warm, they bleed no more; and that, after the bleeding has stopped, they begin to run again upon covering the roots with snow. The more severe the winter has been, the juice is found to be richer and in greater quantity. The trees which grow on hills or high land yield a richer juice than those which are produced in low countries; and the middle-aged than the young or the old.

Mr Kalm informs us, in the Swedish Transactions for the year 1751, that one tree, if the summer does not come on hastily, will yield about forty-two gallons of juice (English wine-measure), and that the quan-

tity which issues in one day from three to six gallons: that eleven gallons of juice of middling quality give a pound of sugar, and that sometimes a pound has been gained from three gallons and a half: that two persons can in one spring prepare commodiously 200 pounds. He observes, that this sugar is weaker than that from the sugar-cane; but that for some purposes it answers better, as for chocolate and preserves. It is likewise esteemed more medicinal. Considerable quantities are brought annually into Europe, particularly France, and there employed in disorders of the breast. It is reckoned that a pound of common sugar goes as far in sweetening as two pounds of maple-sugar.

The large maple, commonly called *sycamore tree*, bleeds also in Europe a sweet juice, from which an actual sugar has been prepared. In the Transactions above-mentioned, for the year 1754, there is an account of some experiments made in this view upon the Swedish maple. Eight trees, none of them under thirty years, bled in four days fourteen gallons of juice; which, inspissated, gave two pounds and a half of brown-sugar. Another time, the same eight trees bled in three days ten gallons and a half; which yielded one pound four ounces of sugar, with half a pound of syrup. It is the saccharine juice of the maple-tree, which, exuding upon the leaves, renders them so apt to be preyed upon by insects.

The common birch bleeds also a large quantity of a sweetish juice, which yields, on being inspissated, a sweet saline concrete, not however perfectly of the saccharine kind, but seeming to approach more to the nature of manna.

There are sundry other vegetables, raised in our own country, which afford saccharine concretes; as beet-roots, skirrets, parsneps, potatoes, celeri, red-cabbage stalks, the young shoots of Indian wheat. The sugar is most readily obtained from these, by making a tincture of the subject in rectified spirit of wine; which, when saturated by heat, will deposit the sugar upon standing in the cold.

Acid of Sugar. See CHEMISTRY, n° 300.

SUGILLATION, in medicine, an extravasation of blood in the coats of the eye, which at first appears of a reddish colour, and afterwards livid or black. If the disorder is great, bleeding and purging are proper, as are also discutients.

SUICIDE. See SELF-Murder.

SUIDAS, a Greek writer, according to some, flourished in the 11th century, under the reign of the emperor Alexius Comnenus; according to others, before the 10th century. He wrote in Greek an Historical and Geographical Dictionary or Lexicon; a work which, though not always strictly accurate, is nevertheless of great importance, as it contains many things taken from the ancients that are nowhere else to be found. The best edition of Suidas is that of Kuister, in Greek and Latin, with notes, printed in 3 vols fol.

SUIT, is used in different senses; as, 1. Suit of court, or suit-service, which is an attendance the tenant owes to his lord's court. 2. Suit-covenant, where a person has covenanted to do service in the court of the lord. 3. Suit-cultom, which is where one and his ancestors have owed suit time out of mind. 4. It is used for a petition to the king or any person of

Sult.

of dignity, where a lord distrains his tenant for suit, and none is due. In this case, the party may have an attachment against him to appear in the king's court.

SUIT, in law, the same with action. The Romans introduced pretty early set forms for actions and suits in their law, after the example of the Greeks; and made it a rule, that each injury should be redressed by its proper remedy only. *Actiones*, say the Pandects, *compositæ sunt quibus inter se homines disceptarent, quas actiones ne populus prout vellet institueret, certas solenneque esse voluerunt.*" The forms of these actions were originally preserved in the books of the pontifical college as choice and inestimable secrets, till one Cneius Flavius, the secretary of Appius Claudius, stole a copy and published them to the people. The concealment was ridiculous: but the establishment of some standard was undoubtedly necessary to fix the true state of a question of right; lest, in a long and arbitrary process, it might be shifted continually, and be at length no longer discernible. Or, as Cicero expresses it, "*sunt iura, sunt formulæ, de omnibus rebus constituta, ne qui aut in genere iniuria, aut in ratione actionis, errare possit. Expressæ enim sunt ex uniuscuiusque damno, dolore, incommodo, calamitate, injuria, publicæ à prætoribus formulæ, ad quas privata li accommodantur.*" And in the same manner our Bracton, speaking of the original writs upon which all our actions are founded, declares them to be fixed and immutable, unless by authority of parliament. And all the modern legislators of Europe have found it expedient, from the same reasons, to fall into the same or a similar method. In England, the several suits, or remedial instruments of justice, are, from the subject of them, distinguished into three kinds; actions *personal*, *real*, and *mixed*.

Personal actions are such whereby a man claims a debt, or personal duty, or damages in lieu thereof; and likewise whereby a man claims a satisfaction in damages for some injury done to his person or property. The former are said to be founded upon contracts, the latter upon torts or wrongs: and they are the same which the civil law calls "*actiones in personam, quæ adversus eum intenduntur qui ex contractu vel delicto obligatus est aliquid dare vel concedere.*" Of the former nature are all actions upon debt or promises; if of the latter are all actions for trespasses, nuisances, assaults, defamatory words, and the like.

Real actions, (or, as they are called in the Mirror, *feodal actions*) which concern real property only, are such whereby the plaintiff, here called the *demandant*, claims title to have any lands or tenements, rents, commons, or other hereditaments, in fee-simple, fee-tail, or for term of life. By these actions formerly all disputes concerning real estates were decided; but they are now pretty generally laid aside in practice, upon account of the great nicety required in their management, and the inconvenient length of their process: a much more expeditious method of trying titles being since introduced, by other actions personal and mixed.

Mixed actions are suits partaking of the nature of the other two, wherein some real property is demanded, and also personal damages for a wrong sustained. As for instance, an action of waste: which is brought by him who hath the inheritance, in remainder or reversion, against the tenant for life, who hath committed waste therein, to recover not only the land

wasted, which would make it merely a real action; but also treble damages, in pursuance of the statute of Gloucester, which is a personal recompence; and so both, being joined together, denominate it a *mixed action*.

The orderly parts of a suit are these; 1. The original writ. 2. The process. 3. The pleadings. 4. The issue or demurrer. 5. The trial. 6. The judgment, and its incidents. 7. The proceedings in nature of appeals. 8. The execution. See these articles.

SULLY. See BETHUNE.

SULPHUR, an inflammable substance of a yellow colour, consisting of the vitriolic acid and principle of inflammability united. For its properties, See CHEMISTRY, n° 50, 114, 122, 165, 321, 334, 469.

Sulphur is found naturally formed in vast quantity about volcanoes, and in some kinds of minerals. It is extracted from its ores either by melting or subliming. What use it is all brought from other countries; but it is certain that the metallic ores in this country contain a very considerable quantity of sulphur, which, in the common way of working, is dissipated in the air. Dr Watson has shown, in a paper on lead-ore, in the Philosophical Transactions, that the quantity thus dissipated amounts to not less than 700 tons annually in the various lead-mines in England. Volcanoes, earthquakes, &c. have been thought to take their rise from large beds of sulphur supposed to lie underground; but it is much more probable that sulphur is the effect rather than the cause of these phenomena. See VOLCANO.

Sulphur unites easily with all metallic matters, excepting gold, platinum, and zinc; at least we have not found the means of uniting it with these, directly, and without some intermediate substance. The degrees of affinity with which sulphur combines with those metals to which it may be readily united, are different; for it not only unites more easily and abundantly with some than with others, but it also quits those with which it has a less affinity, to unite with others to which it has a stronger affinity.

The affinities of sulphur, according to Mr Geoffroy's table, are, fixed alkali, iron, copper, lead, silver, regulus of antimony, mercury, and gold; and, according to Mr Gellert's table, they are, iron, copper, tin, lead, silver, bismuth, regulus of antimony, mercury, arsenic, and cobalt: gold and zinc are marked in this table as being incapable of uniting with sulphur.

The compounds formed by sulphur with different metals, are different; but all of them possess a metallic lustre, without any ductility: these combinations of sulphur and of metals are very frequently found in a natural state. Almost all the metals which we dig from the earth are naturally found combined with sulphur, forming most of the ores and metallic minerals.

The properties of the combinations of sulphur with metallic matters have been little examined, because these combinations are not of any use; but, on the contrary, when they are found, they must be decomposed, that the metals may be obtained separately from the sulphur. Nevertheless, we know, not only that metals have different degrees of affinity with sulphur; in consequence of which property, sulphur may be, and actually is, in many metallurgical operations, separated from some metals by means of

Sully,
Sulphur.

others to which it is more disposed to unite; but we also know that sulphur facilitates the fusion of hard and difficultly fusible metals, such as copper and iron; and that, on the contrary, it renders the soft and fusible metals, as tin and lead, less easily fusible. These singular effects seem to proceed from the difference of the affinity of sulphur to the several metals.

Sulphur may be separated from metallic matters by several methods. First, as sulphur is volatile, and as these metallic matters are fixed, or at least less volatile than sulphur, the mere action of fire is sufficient to separate sulphur from most metals. As this method is simple, and not expensive, it is generally employed to separate sulphur from ores; which effect is produced by the torrefaction or roasting of these ores. We must, however, except the ore of mercury, or native cinnabar, and also the combinations of arsenic with sulphur, which cannot be decomposed without an intermediate substance, from the great volatility of mercury and of arsenic: although perhaps it would not be impossible to separate the sulphur from these compounds, without an intermediate substance, by a heat carefully applied, long continued, and with access of air.

Secondly, several combinations of sulphur with metals may be decomposed by means of acids; which dissolve the metallic matter, without attacking the sulphur. But in several of these compounds, the sulphur defends the metal from the action of the acids; and this separation by acids does frequently not succeed, or succeeds only imperfectly. Crude antimony is one of the sulphurated metallic substances from which sulphur may most easily be separated by means of aqua regia. This menstruum seizes readily the regulus of antimony contained in mineral antimony, and separates from it the sulphur, which then appears in form of a white powder.

Lastly, we may, as we have already said, separate several metals from sulphur by means of other metals, to which the sulphur has a greater affinity. This separation is practised in several operations, as in the dry parting, the purification of gold by antimony, the decomposition of cinnabar, of orpiment, and of crude antimony.

The uses of sulphur are considerably extensive in chemistry, in medicine, and in arts. The liver of sulphur is employed in chemistry for several solutions. Sulphur is also useful for several fusions, precipitations, and separations of metals and minerals, as we have already mentioned. Lastly, as sulphur contains a very large quantity of viriolic acid, a method has been found, and is now practised, of extracting from it this acid, by burning sulphur in close vessels, with the addition of some nitre, and by an operation similar to that of the clyffus.

Sulphur is employed in medicine, both internally and externally, for athmatic diseases of the breast, and for several diseases of the skin of the nature of the itch. The internal preparations of sulphur are, flowers of sulphur, washed sulphur, magistery of sulphur, tablets, balsams, livers of sulphur, and others; in some of which this substance is not altered, but only purified and divided; and in others, is combined and associated with other substances; without reckoning the sulphureous combinations of antimony and of mercury.

Some physicians and chemists, considering that sul-

phur is unsoluble in water, and capable of resisting the action of most menstruums, have advanced, that it can produce no effect when taken internally, single and unaltered; but this assertion seems to be without foundation; for we are certain that the sweat and perspiration of those who take sulphur internally, have a smell evidently sulphureous. Besides, sulphur is much more soluble than is generally believed. It is attacked by all oily and saponaceous substances, and consequently by almost all animal liquors.

We cannot easily form a very distinct and clear idea of the manner in which sulphur acts internally upon our bodies; but, from observations made upon its effects, it appears to be dividing, stimulating, and somewhat heating: it principally acts upon the perspirable parts of the body, the chief of which are the skin and lungs; and from this property it is particularly useful in some diseases of these parts.

Sulphur is also a powerful repellent; as appears from its curing several kinds of itch, merely by external application in form of ointments and pomatums.

Several mineral waters, which are drank or used as baths for some diseases, owe their good qualities to sulphur contained in them.

Sulphur is also used in several arts. By means of it fine impressions of engraved stones are taken*. Matches* are formed of it; and its utility as an ingredient in the preparation of gun-powder and fire-works is well known. Lastly, it is used for whitening wool, silk, and many other matters exposed to its vapour during its combustion; the colours and reds of which could not be destroyed by any other substance, but are quickly effaced by this acid vapour.

SULPICIA, an ancient Roman poetess, who lived under the reign of Domitian, and has been so much admired as to be termed the *Roman Sappho*. We have nothing, however, left of her writing, but a satire, or rather the fragment of one, against Domitian, who published a decree for the banishment of philosophers from Rome: which satire is to be found in Scaliger's *Appendix Virgiliana*. She is mentioned by Martial and Sidonius Apollinaris; and is said to have addressed a poem on conjugal love to her husband Calenus, a Roman knight.

SULPICIOUS (Severus), an ecclesiastical writer who flourished about the beginning of the 5th century, and was cotemporary with Rufinus and St Jerom. He was the disciple of St Martin of Tours, whose life he has written; and the friend of Paulinus bishop of Nola, with whom he held an intimate correspondence. The principal of his works is his *Hystoria Sacra*, from the creation of the world to the consulate of Stilicho and Aurelian, about the year 400; in which his style is elegant beyond the age he lived in.

SULTAN, or SOLDAN, a title or appellation given the emperor of the Turks.

Vattier will have the word Turkish, and to signify *king of kings*; adding, that it was first given the Turkish princes Angrolipex and Masgud, about the year 1055; others will have it originally Persian, alleging, in proof hereof, an ancient medal of Cosroe; others derive it from *soldanus*, *quasi solus dominus*; others from the Hebrew שולט, *schalat*, "to rule, reign."

It had its rise under Mahmoud, son of Sebesteghin, the first emperor of the dynasty of the Gaznevites, towards

* See the
article
CASTS.

wards the close of the fourth century of the æra of the Hegira : when that prince going to Segeftan to reduce Kalaf governor of that province, who affected the fovereignty, Kalaf was no fooner advertifed of his coming, than he went out to meet him, delivered the keys of his fortrefs, and owned him his *fultan*, that is, his lord or commander. The title pleafed Mahmoud well, that he affumed it ever afterwards ; and from him it paffed to his defcendents, and to other Mahometan princes.

SUN, fignifies the quantity that arifes from the addition of two or more magnitudes, numbers, or quantities together.

SUMACH, in botany. See RHUS.

SUMATRA, the largeft, excepting Borneo, of the Sunda iflands in the Eaft Indies. It extends itfelf north-weft and fouth-eaft ; having Malacca on the north, Borneo on the eaft, and Java on the fouth-eaft, from which it is parted by the ftraits of Sunda. It is divided by the equinoctial nearly into two equal parts ; extending to 6° of latitude, north and fouth. It is about 250 leagues in length, 60 in breadth, and 500 in circumference. It is very rich and fertile ; yielding not only fulphur, rice, ginger, pepper, camphire, caffia, fandal, and other woods and drugs ; but alfo fine tin, iron, copper, filver, gold, and diamonds. It is fo rich in gold, that it is fuppofed to be the Ophir and golden Cherfonefe of the ancients ; but what the Europeans trade with them for chiefly is their pepper. The camphire of Sumatra is looked upon as the very fineft in the Indies, and, as Mr Charles Miller affures us, is worth 200 l. per hundred weight on the fpot. It bears a great price in China, where they make ufe of it as a kind of leaven, mixing it with their own which is a coarfer kind, to which they think it gives odour and fpirit.

Both the English and Dutch have feveral colonies and fettlements here. The chief of the Britifh fettlements are thofe of Bencoolen and Fort Marlborough, on the weft coaft ; from whence the Eaft India company import more pepper than from any country in India. There are alfo great quantities of the beft walking-canes imported from thence.

The natives are of a very dark fwarthy complexion, but not black. According to Mr Miller's account, they are canibals. The coafts are poffeffed by Mohammedan princes, of whom the king of Achen, at the north end of the ifland, is the moft confiderable. The inland country is in poffeffion of feveral Pagan princes, who have little correpondence with foreigners. The animals here are much the fame as thofe on the neighbouring continent of Malacca.

SUMMARY, in matters of literature. See ABRIDGMENT.

SUMMER, one of the feafons of the year, commencing in thefe northern regions on the day the fun enters Cancer, and ending when he quits Virgo : or, more ftrictly and univerfally, the fummer begins on the day when the fun's meridian diftance from the zenith is the leaft, and ends on the day when his diftance is a mean betwixt the greateft and fmalleft. The end of fummer coincides with the beginning of winter. See SEASONS.

SUMMER-Iflands. See BERMUDAS.

SUMMIT, the top or vertex of any body or figure, as of a triangle, cone, pyramid, &c.

SUMMONS, in law, a citing or calling a perfon to any court, to anfwer a complaint, or even to give in his evidence.

Summons
Superfeta-
tion.

SUMPTUARY LAWS, are laws made to refrain excefs in apparel, and prohibit cofly clothes, of which heretofore we had many in England ; but they are all repealed by 1 Jac. 1. 3 Infl. 199.

SUN, SOL, ☉, in aftronomy, the great luminary which enlightens the world, and by its prefence conftitutes day. See ASTRONOMY, *passim*.

Mock-SUN. See PARHELION.

SUN-Fish of the Irish. See SQUALUS.

SUN-Flower, in botany. See HELIANTHUS.

SUNDA ISLANDS, a general name for a clufter of iflands in the India Ocean, between 93° and 120° of E. Longitude, and between 8° North and 8° South Latitude. The particular names of the iflands are, *Borneo, Sumatra, Java, Bally, Laraboe, and Banca*. See thefe articles.

SUNDAY, or the LORD'S-DAY, a folemn feftival obferved by Chriftians on the firft day of every week, in memory of our Saviour's refurrection.

This is the principal and moft noted of the Chriftian feftivals, and was obferved with great veneration in the ancient church, from the time of the apoftles, who themfelves are often faid to have met on that day for divine fervice. It is likewife called the *Sabbath-day*, as being fubftituted in the room of the Jewifh fabbath. See the article SABBATH.

The ancients retained the name *Sunday*, or *dies folis*, in compliance with the ordinary forms of fpeech, the firft day of the week being fo called by the Romans, becaufe it was dedicated to the worfhip of the fun.

SUOVETAURILIA, an ancient Roman facifice, fo called becaufe it confifted of a pig (*ſus*), a fheep, or rather ram (*ovis*), and a bull (*taurus*). They were all males, to denote the mafculine courage of the Roman people. It was likewife called *folitaurilia*, becaufe the animals offered up were always *folida*, whole or uncut.

SUPERCARGO, a perfon employed by merchants to go a voyage, and overfee their cargo or lading, and difpofe of it to the beft advantage.

SUPERCILIUM, in anatomy, the eye-brow See ANATOMY, n° 406.

SUPEREROGATION, in theology, what a man does beyond his duty, or more than he was commanded to do. The Romanifts ftand up strenuously for works of fupererogation, and maintain that the obfervance of evangelical councils is fuch. By means hereof, a flock of merit is laid up, which the church has the difpofal of, and which ſhe diftributes in indulgences to fuch as need. The reformed church do not allow of any work of fupererogation.

SUPERFETATION, in medicine, a fecond or after-conception, happening when the mother, already pregnant, conceives of a latter coition ; fo that ſhe bears at once two foetufes of unequal age and bulk, and is delivered of them at different times. We meet with inftances of fuperfetations in Hippocrates, Ariſtotle, Du Laurens, &c. : but they are faid to be much more frequent in hares and fows. Naturalifts hold, that female rats are frequently born with young rats in their wombs ; and we are told of extraordinary inftances of this kind in the female part of the human

Superficies Species, by Bartholine, Mentzelius, and in the history of the Royal Academy of Arts and Sciences.

Supporters.

SUPERFICIES, or **SURFACE**, in geometry, a magnitude considered as having two dimensions; or extended in length and breadth, but without thickness or depth.

SUPERFINE, in the manufactories, a term used to express the superlative fineness of a stuff: thus a cloth, a camlet, &c. are said to be superfine when made of the finest wool, &c. or when they are the finest that can be made.

SUPERINTENDANT, in the French customs, an officer who has the prime management and direction of the finances or revenues of the king.

SUPERIOR, something raised above another; or some person that has a right to command another.

SUPERIOR, in Scots law. See **LAW**, N° cclxiv. 3. clxv. 2. & clxvi.

SUPERLATIVE, in grammar, one of the three degrees of comparison, being that inflection of nouns adjective that serves to augment and heighten their signification, and shows the quality of the thing denoted to be in the highest degree. See **GRAMMAR**.

SUPERNUMERARY, something over and above a fixed number. In several of the offices are supernumerary clerks, to be ready on extraordinary occasions.

SUPERSTITION, extravagant devotion; or religion wrong directed or conducted.

SUPERVISOR, a surveyor or overseer.

SUPINATION, in anatomy, the action of a supinator muscle, or the motion whereby it turns the hand so as that the palm is lifted up towards heaven.

SUPINE, in Latin grammar, part of the conjugation of a verb, being a verbal substantive of the singular number, and the fourth declension.

There are two kinds of supines. One, called the *first supine*, ending in *um* of the accusative case, is always of an active signification, and marks a motion; as, *abijt deambulatum*. The other, called the *last supine*, and ending in *u* of the ablative case, is of a passive signification, and is governed by substantives or adjectives; as, *facile dictu*, &c.

SUPER, the evening repast.—Suppers that are heavy should be avoided, because the stomach is more oppressed with the same quantity of food in an horizontal posture than in an erect one, and because digestion goes on more slowly when we sleep than when we are awake. They should be eaten long enough before bed-time, that they may be nearly digested before going to sleep; and then a draught of pure water will dilute that which remains in the stomach.

SUPPLEMENT, in matters of literature, an appendage to a book, to supply what is wanting therein.

SUPPORTED, in heraldry, a term applied to the uppermost quarters of a shield when divided into several quarters, these seeming as it were supported or sustained by those below. The chief is said to be supported when it is of two colours, and the upper colour takes up two-thirds of it. In this case it is supported by the colour underneath.

SUPPORTERS, in heraldry, figures in an achievement placed by the side of the shield, and seeming to support or hold up the same. Supporters are chiefly figures of beasts: figures of human creatures for the like purpose are called *tenants*.

SUPPOSITION, in music, according to Rousseau, *supposition* has two senses.

1. When several notes rise or descend diatonically in one part upon the same sound in another, then these diatonick notes cannot all form a harmony, nor enter at once into the same chord: there are some of them, therefore, which must be reckoned as nothing; and it is these notes foreign to the harmony which are called *notes by supposition*.

The general rule is, when the notes are equal, that all those which are struck in the perfect time should carry harmony; those which pass during the imperfect time are notes of supposition, which are only placed there on account of the melody, and to form gradations conjoined. The reader will see what is meant by conjoined or disjoined gradations, by consulting **MUSIC**, art. 50. But, to render the matter perspicuous, let it be understood, that, in gradations conjoined, the highest sound of the inferior degree forms likewise the lowest of the superior; whereas, in such as are disjoined, the series from beginning to end continually rises or descends by some one interval or another; and in this case the highest note of the lowest degree will not begin the succeeding series, which must commence at least a tone or semitone above it. Let it be observed, that by perfect and imperfect times we would be less understood to mean the principal divisions of the bar, than even the aliquot parts of each division. Thus, if there were two equal notes in the same time, or, in other words, two aliquot parts in the same principal division of the bar, it is the first of these notes or parts which carries the harmony; the second is a note of supposition. If the time consists of four equal notes, the first and third carry harmony, the second and fourth are notes of supposition, &c.

Sometimes this order is reversed; the first note is passed over by supposition, and the second carries harmony: but in that case the duration of the second note is generally increased by a point, at the expence of the first.

All this constantly supposes a diatonick procedure by conjoined gradations; for when the degrees are disjoined, there is no such thing as supposition, and all the notes ought to enter into the chord.

2. Those are also called *chords by supposition* in which the continued bass adds or supposes some sounds beneath the fundamental bass; which occasions such chords always to occupy a larger compass than the extent of the octave.

The dissonances of chords by supposition should always be prepared by syncopations, and resolved in descending diatonically upon some sound of a chord under which the supposed bass may be recognized as a fundamental, or at least as a continued bass. For this reason, chords by supposition, if thoroughly examined, may all of them pass for mere suspenses.

There are three kinds of chords by supposition; all of them are chords of the seventh. The first, when the superadded sound is a third below the fundamental; such is the chord of the ninth: if the chord of the ninth is formed by the mediant superadded beneath the chord containing the sensible note in the minor mode, in that case the chord takes the name of the fifth redundant. The second kind is, when the sound supposed is a fifth beneath the fundamental,

Suppository as in the chord of the fourth, otherwise called the *eleventh*; if the chord contains the sensible note, and the tonic be supposed, the chord takes the name of *seventh redundant*. The third kind is that where the supposed found is beneath a chord of the seventh diminished: if it is a third below, that is to say, if the found supposed be the dominant, the chord is called a *chord of the second minor and third major*; it is very little in practice: if the found superadded be a fifth below, or if that found be the mediant, the chord is called a *chord of the fourth and fifth redundant*; and if it is a seventh below, that is to say the tonic itself, the chord takes the name of the *sixth minor*, and *seventh redundant*. With respect to the inversion of these different chords, where the supposed found is transferred to the higher parts, as it is only admitted by a licence, it should not be practised without choice and circumspection. At the word **ACCORD**, in *Rousseau's Musical Dictionary*, will be found all those which are tolerable.

SUPPOSITORY, a kind of medicated cone or ball, which is introduced into the anus for opening of the belly. Suppositories are usually made of soap, sugar, alum, or a piece of tallow-candle about the length of a man's thumb and the breadth of a finger; though they may be made smaller for children, and sometimes a little thicker for adults.

SUPPRESSION, in medicine, is generally used to signify a retention of urine or of the menses.

SUPPURATION, the second way wherein an inflammation terminates; being a conversion of the inspissated blood and the first adjacent parts, as the vessels and fat, into pus or matter; which disorder, when it has not yet found an opening, is generally called an *abscess*.

SUPRASPINATUS, in anatomy. See there, *Table of the Muscles*.

SUPREMACY, the superiority or sovereignty of the king. See **SOVEREIGNTY**.

SUR, or **SHUR**, (anc. geog.) a desert of Arabia Petrea, extending between Palestine and the Arabian Gulph; into which the Israelites, on their landing out of the Red Sea, first came, Exod. xv. 22. Again, Numb. xxxiii. 8. it is said, that from the sea they went three days journey into the Wilderness of Etham; whence some conclude that Etham and Shur are the same wilderness; or only differ as a part from the whole, Shur being the general name, and Etham that part of it lying nearest to Etham; thus contending, that the passage through the sea was straight forwards. Others, on the contrary, from the intent of the passage through the sea, namely, the drowning of the Egyptians, maintain, that they only took a circuit or compass in the sea, which as they entered into they also came out of, in the Wilderness of Etham. Now called *Corandel*, (Thevenot.)

SURAT, a sea-port town of Asia, in the province of Gozarat, and in the peninsula on this side the Ganges. It was built in the year 1660, on the banks of the river Tapa, the then mart-town being in another place: and when the English removed from it to this, others followed their example; and in a few years it became a large place, and is now said to have 200,000 inhabitants. Its trade is very considerable; for from 1690 to 1705, the revenues arising from the custom-

house and other things amounted to 162,500 pounds. In this city there are as many different religions as in Amsterdam; for there are Mahometans of several sects, and many sorts of Gentoos, of which the Banyans are the most numerous. These are either merchants, bankers, brokers, accountants, collectors, or surveyors; but there are very few handicraftsmen, except tailors and barbers. It is said that there are 85 different sects among them, who never eat with each other.

There are also Talapins, who are great enemies to the Papists, and preach up morality to be the best guide of human life. They live upon alms, seldom speak in the streets, and extend their charity even to birds and beasts. Of Perfecs there are a great number about Surat and the adjacent countries. They were banished from Persia in the 7th century, because they would not change their religion. They never marry into any other religion, which keeps their complexion almost as fair as that of the Europeans. Besides those, there are Jews and Armenian Christians, who are all great merchants. The fields about Surat are all plain; and the soil is fertile, except towards the sea, which is sandy and barren. All sorts of provisions are very cheap, and they have as good wheat as in Europe. They have various sorts of fowls; and plenty of antelopes in their forests, though but few deer. There are no fine buildings, but many of the houses are large; and there are caravansaries and mosques. The French have a little church near the old English factory, where they keep a few capuchins, who practise surgery without a reward. The English and Dutch agents make a good figure here, and they always maintain a good understanding with the officers of state and justice. The affairs of the East India company are managed by a president and council; and the former lives in great splendor. The Mahometan women are always veiled when they appear abroad, and their dress is much the same as the men. The Gentoo women are bare-faced, and their legs are bare up to the knee. They have several gold and silver rings on their noses, ears, legs, and toes. Surat, together with the citadel, was taken by the English in April 1759, and afterwards ceded to them by the Great Mogul. It is 160 miles north of Bombay, and 375 south-west of Agra. E. Long. 72. 25. N. Lat. 21. 10.

SURD, in arithmetic and Algebra, denotes any number or quantity that is incommensurable to unity: otherwise called an *irrational number* or *quantity*. See **ALGEBRA**, n^o 10, 11.

SURETY, in law, generally signifies the same with **BAIL**.

SURFACE. See **SUPERFICIES**.

SURFEIT, in medicine, a sickness with a sensation of a load at the stomach, usually proceeding from some error in diet, either with regard to the quantity or quality of the food taken. Sometimes, however, a surfeit is only a plethora from indolence and full but improper feeding; in which case perspiration is defective, and eruptions form themselves on the skin.

A surfeit from animal-food, as muscles, putrid flesh, &c. is best remedied by the use of vegetable acids, which may be taken diluted with water, a vomit being prefixed, and this even though a vomiting and purging both attend.

When an excess of feeding is the cause, the primæ

Surat
Surfeit.

Surfeit viz being evacuated, and the nature of the plethora attended to, that the load may be properly evacuated, the indication of cure will be, to recover the perspiratory discharge, consistent with which diuretics may be used in preference to medicines which produce any other evacuation.

SURFEIT, in farriery. See there, § xix.

SURGE, in the sea-language, the same with a wave. See WAVE.

SURGEON, or CHIRURGEON, one that professes the art of SURGERY.

In England there are two distinct companies of surgeons now occupying the science or faculty of surgery; the one company called *barbers*, the other *surgeons*, which latter are not incorporated.—The two are united to sue, and be sued, by the name of *masters or governors* and commonalty of the *mystery of barbers and surgeons of London*. 32 H. VIII. c. 42.

No person using any *barbery* or *shaving* in London, shall occupy any *surgery*, letting of blood, or other matter; drawing of teeth only excepted.—And no person using the *mystery* or craft of *surgery* shall occupy or exercise the feat or craft of *barbery*, or

shaving; neither by himself, nor any other for his use. 32 VIII. 8. c. 42. Surgeon.

By the same statute, surgeons are obliged to have signs at their doors.

The French *chirurgiens* being refused to be admitted into the universities, (notwithstanding that their art makes a branch of medicine,) on pretence of its bordering a little on *butchery* or *crudely*, associated themselves into a brotherhood, under the protection of S. Cosmus and S. Damian: on which account, according to the laws of their institution, they are obliged to dress and look to wounds *gratis* the first Monday of each month.

They distinguish between a *chirurgien* of the long robe, and a *barber-chirurgien*. The first has studied *physic*, and is allowed to wear a gown. The skill of the other, besides what relates to the management of the beard, is supposed to be confined to the more simple and easy operations in *chirurgery*; as bleeding, tooth-drawing, &c.

They were formerly distinguished by badges: those of the long gown bore a case of instruments; the barber, a basin.

S U R G E R Y .

SURGERY, a branch of medicine, including the knowledge of all those diseases wherein the application of the hand is necessary, whether such diseases are occasioned by external injuries, or take their rise

from internal causes, with the method of performing all manual operations which may be necessary in such cases.

PART I. HISTORY OF SURGERY.

History.
2
Origin of
the art.

THAT surgery was coeval with the other branches of medicine, or perhaps antecedent to any of them, will not admit of doubt. The wars and contentions which have taken place among mankind almost ever since their creation, necessarily imply that there would be occasion for surgeons at a very early period; and probably these external injuries would for some time be the only diseases for which a cure would be attempted, or perhaps thought practicable.—In the sacred writings we find much mention of balsams, particularly the balm of Gilead, as excellent in the cure of wounds: though at the same time we are informed that there were some wounds which this balsam could not heal; as indeed we know, at this day, there are many wounds which, though curable by internal medicines, will resist the most powerful external applications.

2
Of the sur-
gery of the
ancient
Greeks.

Concerning the surgery practised among the Egyptians, Jews, and Asiatic nations, we know little or nothing. The Greeks were those from whom the art descended to us, though they confessedly received it from the eastern nations. The first Greek surgeons on record are *Æsculapius*, and his sons *Podalirius* and *Machaon*. *Æsculapius* flourished about 50 years before the Trojan war; and his two sons distinguished themselves in that war both by their valour and skill in curing wounds. This indeed is the whole of the medical skill attributed to them by Homer; for in the plague which broke out in the Grecian camp, he does not mention their being at all consulted. Nay, what is still more strange, though he sometimes mentions his heroes having their bones broke, he never takes

notice of their being reduced or cured by any other than supernatural means; as in the case of *Æneas*, whose thigh-bone was broken by a stone cast at him by *Diomed*. The methods which these two famous surgeons used in curing the wounds of their fellow-soldiers seems to have been the extracting or cutting out the dart which inflicted it, and applying emollient fomentations or styptics, when necessary, to the wound: and to these they undoubtedly attributed much more virtue than they could possibly possess; as appears from the following lines, where *Homer* describes *Eurypylos* as wounded and under the hands of *Patroclus*, who would certainly practise according to the directions of the surgeons.

Patroclus cut the forky steel away;
Then in his hands a bitter root he bruist'd,
The wound he wash'd, the styptic juice infus'd.
The closing flesh that instant ceas'd to glow;
The wound to torture, and the blood to flow.

Till the days of *Hippocrates* we know very little of what was the practice of the Greek surgeons. From 3 State of the art in the him, however, we learn, that the practice of blood-time of Hip- letting, cupping, and scarification, was known to them; pocrates.— also the use of warm and emollient fomentations, issues made with hot irons, pessaries, injections, fumigations, &c. *Hippocrates* also gives directions with regard to fractures, luxations, ulcers, fistulas, He directs the extension, reduction, bandages, and splints, proper to be used in fractures and luxations of different bones, with several machines to increase the extension when necessary. He directs the laxity and

History.

History.

History.

and tightness of the bandages; the intervals for unloosing and binding them on again; the position and repose of the fractured member, the regimen and diet; and he mentions the time when a callus is usually formed. He treats also of fractures of the skull, and the method of applying the trepan. In his treatment of ulcers, he speaks of reducing fungous flesh by means of escharotics, some of which are alum, nitre, verdigrise, quicklime, &c.

4
Surgery becomes a distinct branch.

In the time of Ptolemy Philopater of Egypt, medicine, all the branches of which had hitherto been practised by the same person, was now divided into three, viz. the dietetic, pharmaceutical, and surgical; from which time to the present, surgery has continued to be reckoned a distinct profession from medicine, though very improperly, in the opinion of the best authors.

5
Archagathus the first Roman surgeon expelled the city.

Surgery appears not to have existed in Rome, notwithstanding the warlike genius of the people, for more than 500 years. Archagathus, a Greek, was the first professor of that art in the city; and so frequently employed the knife, hot irons, and other cruel methods of cure, that he was branded with the opprobrious title of *hangman*, and expelled the city, where no physician or surgeon of eminence again made his appearance for 180 years. At this time Asclepiads undertook the profession of medicine; but seems to have dealt little in surgery. Neither have we any thing of importance on that subject till the time of Celsus, who flourished during the reigns of Augustus and Tiberius.—In his surgery, all the improvements from Hippocrates to his own days are collected; the most minute and trifling diseases are not omitted.

6
State of surgery in the time of Celsus.

An eminent surgeon, of the moderns, emphatically exhorts every person in that profession "to keep Celsus in his hands by day and by night." He describes the signs of a fractured skull, the method of examining for the fracture, of laying the skull bare by an incision in the form of the latter X, and afterwards of cutting away the angles, and of applying the trepan, with the signs of danger and of recovery. He observed, that sometimes, though very rarely, a fatal concussion of the brain might happen, the blood-vessels within the skull being burst, yet the bone remaining entire. After the operation of the trepan, sponges and cloths wet in vinegar, and several other applications, were made to the head; and, throughout, severe abstinence was enjoined. In violent fractures of the ribs, he ordered venesection; low diet; to avoid passions of mind, loud speaking, motion, and every thing that might excite coughing or sneezing; cloths wet in wine, roses and oil, and other applications, were laid over the fracture. The cure of fractures, in the upper and lower extremities, he said were nearly alike; that fractures differ in degree of violence and danger, in being simple or compound, that is, with or without a wound of the flesh, and in being near to the joint. He directs the extension of the member by assistants; the reduction, by the surgeon's hands, of the fractured bones into their natural situation; and to bind the fractured part with bandages of different lengths, previously dipped in wine and oil: on the third day fresh bandages are to be applied, and the fractured member fomented with warm vapour, especially during the inflammation. Splints,

if necessary, are to be applied, to retain the bones in a fixed position. The fractured arm is to be suspended in a broad sling hung round the neck: the fractured leg is to be inclosed in a kind of case, reaching above the ham, and accommodated likewise with a support to the foot, and with straps at the side, to keep the leg steady: in the fractured thigh-bone, the case is to extend from the top of the hip to the foot. He describes the method of treating compound fractures, and of removing small fragments of splinters of bones; and the manner of extracting darts. In luxations of the shoulder, he mentions several methods of giving force to the extension, and of replacing the dislocated bone. One method similar to Hippocrates was, to suspend the patient by the arm; the fore-part of the shoulder, at the same time, resting upon the top of a door, or any other such firm fulcrum. Another method was to lay the patient supine, some assistants retaining the body in a fixed position, and others extending the arm in the contrary direction; the surgeon, in the mean time, attempting, by his hands, forcibly to reduce the bone into its former place.

If a large inflammation was expected to ensue after a wound, it was suffered to bleed for some time, and blood was drawn from the arm. To wounds accompanied with considerable hæmorrhage, he applied a sponge wet in vinegar, and constant pressure: if necessary, for the violence of the hæmorrhage, ligatures were made round the vessels, and sometimes the bleeding orifice was seared up with the point of a hot iron. On the third day fresh dressings were applied. In considerable contusions, with a small wound of the flesh, if neither nerves nor blood-vessel prevented, the wound was to be enlarged. Abstinence and low diet, in all such accidents, was prescribed; cloths wet with vinegar, and several other applications, were directed to the inflamed part. He observes, that fresh wounds may be healed without compound applications: Hippocrates used a piece of dry sponge, and condemned greasy ingredients. In external gangrene, Celsus cut into the sound flesh; and when the disease, in spite of every effort, spread, he advised extirpation of the member. After cutting to the bone, the flesh was then separated from it, and drawn back, in order to save as much flesh as possible to cover the extremity of the bone. Celsus, though extremely diffuse in the description of surgical diseases, and of various remedies and external applications, yet is nearly silent on the method and process of extirpating members; from which, comparing his treatise with the modern system, we might infer, that the operation was then seldom practised than at present. He describes the symptoms of that dangerous inflammation the carbuncle, and directed immediately to burn or to corrode the gangrened part. To promote the suppuration of abscesses, he ordered poultices of barley-meal, or of marsh-mallows, or the seeds of linseed and fennel. He also mentions the compositions of several repellent cataplasms. In that superficial inflammation called the *erysipelas*, he applied cerus, mixed with the juice of solanum or nightshade. Sal ammoniac was sometimes mixed with his plasters.

He is very minute in describing diseases of the eyes, ears, and teeth, and in prescribing a multitude of remedies and applications. In inflammation of the eyes, he.

History.

History.

the enjoined abstinence and low diet, rest, and a dark room: if the inflammation was violent, with great pain, he ordered venesection and a purgative; a small poultice of fine flower, saffron, and the white of an egg, to be laid to the forehead to suppress the flow of pituita; the soft inside of warm white bread dipped in wine, to be laid to the eye; poppy and roses were also added to his collariums, and various ingredients too tedious to enumerate. In chronic watery distensions of the eyes, he applied astringents, cupped the temples, and burnt the veins over the temple and forehead. He couched cataracts by depressing the crystalline lens to the bottom of the orbit. Teeth, loosened by any accident, he directed, after the example of Hippocrates, to be fastened with a gold thread to those adjoining on each side. Previous to drawing a tooth, he ordered the gum to be cut round its neck; and if the tooth was hollow, it was to be filled with lead before extraction, to prevent its breaking by the forceps. He describes not only the inflammation, but likewise the elongation, of the uvula: he also describes the polypus, and some other diseases affecting the nose.

He describes several species of hernia or ruptures, and also the hydrocele or dropsy of the scrotum, and the manual assistance required in those complaints. After the return of the intestines into the abdomen, a firm compress was applied to that part of the groin through which they protruded, and was secured by a bandage round the loins. In some cases, after the return of intestinal ruptures, he diminished the quantity of loose skin, and formed a cicatrix, so as to contract over the part, to render it more rigid and capable of resisting. He describes various diseases of the genital parts, a difficulty of urine, and the manner of drawing off the water by a catheter; the signs of stone in the bladder, and the method of sounding or feeling for that stone. Lithotomy was at that time performed by introducing two fingers into the anus; the stone was then pressed forward to the perineum, and a cut made into the bladder; and by a crooked instrument, made in a particular form, the stone was extracted. He describes the manner of performing this operation on both the sexes, of treating the patient, and the signs of recovery and of danger. Hippocrates had even ventured to cut into the kidney, either to give a discharge to abscesses or to extract stones.

Celsus directed various corrosive applications and injections to fistulas; and, in the last extremity, opened them to the bottom with a knife, cutting upon a grooved instrument or conductor. In old callous ulcers, he made a new wound, by either cutting away the hard edges, or corroding them with verdigrise, quick-lime, alum, nitre, and with some vegetable escharotics. He mentions the symptoms of caries in the bone; directs the bone to be laid bare, and to be pierced with several holes, or with the trepan, or to be burnt or rasped, in order to promote an exfoliation of the corrupted part; afterwards to apply nitre and several other ingredients. One of his applications to a cancer was auripigmentum or arsenic. He directs the manner of tapping the abdomen in the ascites, and of drawing blood by the lancet and cupping-glasses. His cupping-glasses seem not to have been so convenient as the modern: they were made either of brass or horn, and were unpurged with a pump. He cured vari-

cose veins by usion or by incision. He gives directions for extracting the dead foetus from the womb, in whatever position it should present; and, after delivery, applied to the private parts soft cloths wet in an infusion of vinegar and roses. In Celsus's works there is a great redundancy and superfluity of plasters, ointments, escharotics, collariums, of suppurating and discutient cataplasms, and external applications of every kind, both simple and compound: perhaps, amongst the multitude, there are a few useful remedies now laid aside and neglected.

The last writer of consequence who flourished at Rome was Galen, physician to the emperor Marcus Aurelius. His works are for the most part purely medicinal; however, he wrote also on surgery, and made Commentaries on the Surgery of Hippocrates. He opened the jugular veins, and performed arteriotomy at the temples; directed leeches, scarification, and cupping-glasses, to draw blood. He also described with accuracy the different species of hernia or ruptures.

In the year 500 flourished Aëtius, in whose works we meet with many observations omitted by Celsus and Galen, particularly on the surgical operations, and diseases of women, the causes of difficult labours, and modes of delivery. He also takes notice of the dracunculus, or worm under the skin, a disease at present common in Africa. Aëtius, however, is greatly excelled by Paulus Egineta, who flourished in 640; and whose treatise on surgery is superior to that of Celsus or all the other ancients. He directs how to extract darts; to perform the operation sometimes required in dangerous ruptures or hernia, where the intestines cannot by any other means be returned back; he directs also to tie up punctured arteries in the operation for the aneurism. Galen, Paulus, and all the ancients, speak only of one species of aneurism, and define it to be "a tumour arising from arterial blood, extravasated from a ruptured artery." The aneurism from a dilatation of the artery is a discovery of the moderns. In violent inflammations of the throat, where immediate danger of suffocation was threatened, Paulus performed the operation of bronchotomy. In obstinate distensions upon the eyes, he opened the jugular veins. He describes the manner of opening the arteries behind the ears in chronic pains of the head. He wrote also upon obstetrics, on difficult labours, and other female diseases. Fabricius ab Aquapendente, a celebrated surgeon of the 16th century, has followed Celsus and Paulus as text-books.

From the time of Paulus Egineta to the year 900, no writer of any consequence, either on medicine or surgery, appeared. At this time the Arabian physicians Rhazes and Avicenna revived in the East the medical art, which as well as others was almost all entirely extinguished in the West. Avicenna's *Canon Medicinæ*, or General System of Medicine and Surgery, was for many ages celebrated through all the schools of physics. It was principally compiled from the writings of Galen and Rhazes. The latter had correctly described the spina ventosa, accompanied with an enlargement of the bone, caries, and acute pain. In difficult labours he recommends the fillet to assist in the extraction of the foetus; and for the same purpose Avicenna recommends the forceps. He describes the composi-

tion of several cosmetics to polish the skin and make the hair grow or fall off.

Notwithstanding this, however, it was not till the time of Albucasis, who flourished in the year 1000, that surgery came into repute among the Arabians. Rhazes complains of their gross ignorance, and that the manual operations were performed by the physicians servants. Albucasis enumerates a tremendous list of operations, sufficient to fill us with horror. The hot iron and cauteries were favourite remedies of the Arabians; and, in inveterate pains, they resorted, like the Egyptians and eastern Asiatics, great confidence in burning the part. He describes accurately the manner of tapping in the scitites; mentions several kinds of instruments for drawing blood; and has left a more ample and correct delineation of surgical instruments than any of the ancients. He gives various obstetrical directions for extracting the fœtus in cases of difficult labours. He mentions the bronchocele, or prominent tumour on the neck, which, he tells us, was most frequent among the female sex. We are also informed by this writer, that the delicacy of the Arabian women did not permit male surgeons to perform lithotomy on females; but, when necessary, it was executed by one of their own sex.

Leprosy introduced into Europe.

From the 11th century to the middle of the 14th, the history of surgery affords nothing remarkable except the importation of that noxious disease the leprosy into Europe. St Lewis king of France had caught the leprosy in the Crusades; and in order to a cure, was prescribed the blood of young children, as a potion, by the Jewish physicians. It does not appear that either external or internal remedies were of any avail in curing it, or indeed thought to be so; but, by taking proper precautions to separate the infected from the sound, it gradually disappeared. The discovery of America introduced a new and more terrible disease than the leprosy, namely, the venereal; which at its origin appeared in loathsome ulcers affecting the genitals, and by degrees the palate and uvula. Swellings and buboes arose in the groin: in its more advanced stages, excruciating pains were felt in the bones, especially at night; scabs and small running sores covered the skin; nodes or protuberances appeared in the forehead; the bones became at length carious, enlarged, and rotten: many, after lingering for months under such wretched calamities, others, for a year or more, lost their palate, nose, eyes, lips, teeth, genitals; and, before death, presented a cadaverous spectacle of deformity and corruption. Even at this day, when the disease has become much milder, venereal ulcers will sometimes appear with such inveteracy as to give no small trouble to the surgeon who attempts to remove them.

State of the leprosy.

Soon after this the scurvy, with all its train of direful, and for a long time incurable, ulcers, rigid muscles, and rotten gums, made its appearance. The state of medical knowledge did not, in those ages, admit of a certain and easy cure either for the venereal disease or scurvy, nor was the true cure of the latter known till within these few years.

State of surgery in Britain in the 16th century.

At the beginning of the 16th century surgery was held in contempt in this island, and was practised indiscriminately by barbers, farriers, and low-gelders: the barbers and surgeons company continued for 200 years after to be incorporated, both in London and

Vol. X.

Paris. In Holland and some parts of Germany, even at this day, barbers exercise the razor and lancet alternately. The surgeons company in London, however, have now disengaged themselves from that dishonourable connection: they are now likewise authorized to examine and to grant certificates to young surgeons, which qualify them to purchase or to be appointed to a medical commission in the army or navy. Even yet, however, the distinction between physicians and surgeons is by far too great, and their reciprocal ignorance of these different branches of the same science frequently embarrasses both physician and surgeon, often to the great danger of the patient, as will appear in the sequel of this article.

Too great distinction between physicians and surgeons.

Surgery, in the strict limitation of the word *, is principally confined to wounds, fractures, luxations, tumours, ulcers, and to the different manual operations, instruments, and bandages. These are the themes of general systems of surgery. On this science and art, amongst the ancient surviving writers, Hippocrates, Celsus, Galen, P. Ægineta, and Albucasis, alone possess any intrinsic excellence.

Black's Historical Sketch.

It is within the last three centuries that we have any original improvement in surgery, from the era of the Arabians; nor do we know of any eminent British surgical writers until within the last 130 years. "In Germany," says Heister, "all the different surgical operations, at the beginning even of the 18th century, were left to empirics; the rest were contented to cure a wound, open a vein or an abscess, return a fractured or luxated bone; but they seldom or never ventured to perform any of the difficult operations: he also speaks of their gross ignorance of the Latin language."

The first surgical work of the 16th century, entitled to any pre-eminence or criticism, is that of J. Carpus; but in the effulgence of later writers his light is scarce perceptible. F. ab Aquapendente, an Italian, published a system of Surgery, containing a description of the various diseases, accidents, and operations. Boerhaave pays this author the following compliment: *Ille superavit omnes, et nemo illi hanc disputat gloriam omnibus potius quam hoc carere possumus.* About the same period, A. Parey, a Frenchman, made several important additions to surgery, particularly in his collection of cases of wounds, fractures, and other accidents which occur during war. The ancients, who were ignorant of powder and fire-arms, are defective in this part of military surgery. Parey pretends to have first invented the method of tying, with a needle and strong silk-thread waxed, the extremities of large arteries, after the amputation of a member. The ligation of the blood vessels is, however, merely a revival of the ancient practice, which had fallen into disuse: throughout the dark ages, the hot iron, cauteries, and strong astringents, were substituted in its place. B. Maggus and L. Botallus wrote on the cure of gunshot wounds. J. A. Cruce wrote a system of surgery:

Writers on surgery in the 16th century.

In the 17th century, surgery was enriched with several systems, and with detached or miscellaneous observations. The principal authors are, M. A. Severi, V. Vidius, R. Wiseman, Le Clerc, J. Scultetus, J. Mangetus, C. Magatus, Spigelius, F. Hildanus, T. Bartholin, P. de Marchetti.

The 18th century opens with several eminent surgical

Improvements
in lithotomy.

cal writers and improvements. In the operation of lithotomy, as described by Celsus, the rectum or lower gut, and often the seminal ducts, were wounded, fistulas ensued, or the power of generation was annihilated. The moderns therefore invented three methods different from that of Celsus. One method, and the earliest, was to introduce a catheter into the urethra and bladder, and upon that to make a direct incision through the urethra into the bladder. J. de Romanis, an Italian, in the 16th century, was the original inventor of this operation, a description of which was published by his pupil Marianus. Another method, much later invented, was to distend the bladder as large as possible with urine, and when thus enlarged and elevated, to open into it through the abdominal muscles, immediately above the os pubis. These were called the *high and low operations*; Celsus's, the *apparatus minor*. A French priest called *Frere Jacques* introduced another improvement, somewhat different from the modern low operation, or *apparatus major*. Jacques's incision was directed obliquely and to one side of the urethra, avoiding as much as possible to open any considerable extent of the urinary canal. Inconveniences still attended these various experiments in lithotomy. Jacques was a bold rash man, and ignorant of anatomy; of 60, cut by him for the stone, 25 died soon after; others survived, but under an incontinence of urine and fistulas, and only 13 were perfectly cured. The priest's operation and success is described by J. Merrey. A grooved catheter was afterwards invented to conduct the incision-knife; other surgeons added the cutting-gerget; and, with these improvements, Jacques's lateral operation is now considered as one of the most safe and successful. Douglas, Cheselden, and afterwards Le Dran, took uncommon pains to explain and to improve this operation. J. Denys also wrote well on the stone and lithotomy.

18
Inventions
of M. Petit.

J. Petit of Paris wrote on diseases of the bones, fractures, dislocations, and caries. Boerhaave says, *Tractatus hic nunquam sibi parem habuit*. Petit invented the screwed tourniquet, which can be braced or relaxed at pleasure, and, in the hurry of battles, is extremely useful to compress the large arteries, and to stop the hæmorrhage. Tourniquets were not used until towards the end of the 17th century. The ancients, previous to amputation, only made a tight ligature round the member, or attempted to grasp and compress the arteries with the band and fingers: from these defects, amongst them, the amputation of any large member was thought tremendous, and was too frequently fatal. Of late years, the agaric, growing upon old oak-trees, has been extolled as a powerful styptic in hæmorrhages from large vessels.

19
Different
systems of
surgery.

A complete description of the different surgical accidents and diseases, and of the principal surgical operations, as executed from the beginning of the 18th century to the present time, with descriptions and plates of the instruments and bandages, will be seen in those celebrated writers, French, German, and English, P. Dionis and De la Faye, J. Garengeot, H. F. le Dran, L. Heister, and S. Sharp. Heister's System consists of two quarto volumes, and is prefaced with a large catalogue of writers. To Sharp's Compendium of the surgical operations is added a volume called *A*

Critical Inquiry into the Modern Practice of Surgery. To these may be added, Saviard's Surgical Observations, J. Z. Platner's Surgical Institutions. On gunshot wounds, and on fractures, Ranby and Bromfield merit perusal. Splints of a new construction, to retain fractured bones in a steady position until a callus is formed, were invented by Sharp, and improved by Pott. Gough, with meritorious ingenuity, has invented and published a description of several machines, to secure fractured bones in a fixed situation. As such accidents occur so frequently in life, and above all during war, every invention of this sort, and the author, is entitled to public thanks. There is infinitely more skill and address required to save a fractured member, than to cut it off. Knives and saws are dreadful alternatives; and we have already an exuberant stock of treatises on extirpation.

Numbers had dragged through a great part of life, and many had died in execrating agony, from obstructions of the urethra and fistulas, the consequence of venereal gleet, and other causes. To remedy such complaints, we find bougies of different constructions and materials recommended by the moderns, and described with more or less accuracy in most of the surgical systems. In the present century, Daran and Goulard have written dissertations expressly upon this subject. Goulard's Treatise on the Preparations of Lead, and its utility in external inflammations, sprains, contusions, and a variety of complaints, is also well entitled to perusal.

In preventing the protrusion of inguinal ruptures, the modern steel-bandages called *trusses* are more effectual than the ancient. The nature of the hernia congenita, or inguinal rupture of infants, was obscure before the publications of Haller, Hunter, and Pott. The last author has written excellent treatises on ruptures, and on the hydrocyle.

On diseases of the eyes, and surgical operations on those organs, the most celebrated treatises are written by Maitre Jean, C. St Yves, D. Mauchard, and Taylor. David, a modern French surgeon, rejected the operation of depressing the crystalline lens with a needle to the bottom of the orbit, in couching of cataracts; he made an incision through the external coat of the eye, and extracted this humour entire. In the former mode, the lens frequently ascended, and again interrupted the rays of light.

On the teeth, their diseases, the dentist operations, and the dentition of infants, we have two excellent treatises, one in French, the other in English, written by P. Fauchard and by J. Hunter. We do not meet amongst the ancients with any mention of artificial teeth. Hippocrates and Celsus only direct the immediate reinserting into their sockets found teeth suddenly loosened from the jaw. With us, artificial teeth are commonly made from the hard tusk of a sea-horse. Another modern invention, in which, unfortunately, the advantages and disadvantages are balanced, is that of transplanting found teeth of similar shape and size from one head, and fixing them instantaneously into the fresh sockets of another person's jaws; there they are tied to the neighbouring teeth by a waxed silk thread, and in a few weeks are firmly grasped and secured by the gums.

Through the writings of almost all the eminent anatomists,

The great superiority of the moderns above the an-

cients in the knowledge of anatomy, and the superiority likewise in the construction and workmanship of their instruments, necessarily render all their operations much more safe and prosperous.

History.

PART II. THEORY OF SURGERY.

²⁴ Theories of surgery and medicine connected. **I**N the extensive signification in which we have taken the word *surgery*, it is plain that the theory must include the greatest part, if not the whole, of the theory of medicine. Fevers, for instance, may terminate by a critical swelling; and the surgeon who should ignorantly attempt to discuss a tumor of this kind, might do much mischief. Ulcers may arise from various internal causes; and the person who should attempt to cure them by external applications alone would certainly fail. In like manner, the treatment of a simple wound becomes exceedingly different, according to the constitution and habit of body in the person who is wounded: from all which it is plain, that there is no theory which will in all cases answer; but that the surgeon must be well acquainted with the other branches of medicine, or he cannot practise with any kind of certainty or success.—We shall begin, however, with those cases where the cure is most easy.

SECT. I. Of Simple Wounds.

²⁵ Of mortal wounds. The first thing to be considered in the inspection of a wound is, whether it is likely to prove mortal or not. This knowledge can only be had from anatomy, by which the surgeon will be able to determine what parts are injured; and, from the offices which these parts are calculated to perform, whether the human frame can subsist under such injuries. It is not, however, easy for the most expert anatomist always to prognosticate the event with certainty; only this rule he ought always to lay down to himself, to draw the most favourable prognosis the case will bear, or even more than the rules of his art will allow. This is particularly incumbent on him in sea-engagements, where the sentence of death is executed as soon as pronounced, and the miserable patient is thrown alive into the sea upon the surgeon's declaring his wound to be mortal. There are, besides, instances on record where wounds have healed which the most skilful surgeons have deemed mortal. In the war before last, an officer was shot quite through the body by a musket-ball, which penetrated the substance of the lungs; yet he recovered, though not without great difficulty. Mr Forster informs us that Tupia, a native of the island of O-Tahitee, had been run through the body by one of the spears headed with the bone of the sting-ray; and yet this wound was healed. He informs us also, that in others of that country he had observed the marks of such desperate wounds, that he could not imagine how life could have subsisted under them. In general, however, those wounds are justly deemed mortal.

²⁶ The most favourable prognosis ought always to be drawn.

²⁷ Instances of desperate wounds being healed. 1. That penetrate the cavities of the heart, and all those wounds of the viscera where the large blood-vessels are opened; such are large wounds of the lungs, liver, spleen, kidneys, stomach, intestines, mesentery, pancreas, uterus, aorta; of the iliac, celiac, renal, mesenteric, and carotid arteries, (especially if they are wounded near their origin), of the subclavian

²⁸ Different kinds of wounds which are necessarily mortal.

also or vertebral, of the vena cava, the iliac vein, internal jugular, vertebral, renal, or mesenteric veins; of the vena porta, and of other large veins that lie deep in the body; because their situation will not admit of proper applications to restrain the flux of blood.

2. Those wounds are no less mortal than the former which obstruct or entirely cut off the passage of the animal-spirits through the body. Such are wounds of the cerebellum, medulla oblongata, and some violent strokes of the brain itself; though the cortical substance of the brain may be much injured, and yet the patient recover. There is reason to apprehend very great danger when the small veins or arteries which are contained in the cranium are injured: for the blood flowing from them into the internal sinuses of the brain, either produces too great a pressure upon those very tender parts of the brain, and so obstructs the course of the blood and spirits; or, being corrupted, putrifies the brain itself, if it cannot be evacuated by the assistance of the trepan; which is the case when this accident happens at the lower part of the cranium, or in the sinuses of the brain. Nor is there less danger where the nerves which tend to the heart are wounded, or entirely divided; for, after this, it is impossible for the heart to continue its motion.

3. To this class also are to be referred all wounds that entirely deprive the animal of the faculty of breathing. Therefore there is great danger where the *apera arteria* is completely divided; for, where it is only divided in part, it may be healed again by the assistance of an expert surgeon. To this place also belong violent shocks of the bronchia, mediastinum, and diaphragm, especially the tendinous parts of it.

4. Those wounds also which interrupt the course of the chyle to the heart are no less incurable than the former; such are wounds of the stomach, intestines, receptacle of the chyle, thoracic duct, and larger lacteals; to which we may add wounds of the oesophagus, if they are large; though death is not so sudden an attendant upon these wounds, but for want of nourishment they are greatly weakened by degrees, and die consumptive.

5. Wounds which are inflicted upon membranous parts that are situated in the abdomen, and contain some secreted fluid on the bladders, either for the bile or urine, the stomach, intestines, receptacle of the chyle, and lacteal vessels. The fluids contained in these parts, when once they are let loose into the cavity of the abdomen, cannot be properly discharged, and therefore easily corrode the internal parts of the body; and the membranes that contained them are generally so fine, that they will not admit of agglutination, especially since no medicine from without can be applied; though some few, indeed, have recovered after slight wounds in these parts.

6. We shall next proceed to describe those wounds, which prove fatal if neglected and left to nature. By these are meant those wounds that produce instant themselves.

²⁹ Of such as become mortal when left to death

death unless relieved by present assistance, but are curable by a good surgeon called in time; such are wounds of the larger external blood-vessels, which might be remedied by ligature. Of this kind are wounds of the brachial or crural artery, unless they are too near the trunk of the body. Wounds in the large arteries of the cubit or tibia, of the branches of the external carotid and temporal artery, are of this kind; to these may be added wounds of the jugular and other veins situated upon the external parts of the body.

³⁰
Of those
that become
mortal by
accident.

7. Wounds are properly said to become mortal by accident, where the patient's death is occasioned either by the ill conduct of the patient himself, or by the ignorance or neglect of his surgeon, the wound itself being deemed curable. Under this head are to be reckoned, 1. Those wounds which the surgeon has neglected to cleanse sufficiently, though he had it in his power to do it; as when some foreign body, which might easily have been extracted, is left in the wound by the carelessness of the surgeon, and produces inflammations, hæmorrhages, convulsions, and at last death itself. So in wounds of the thorax and abdomen, if the surgeon does not use his utmost diligence to evacuate the grumous blood, it will corrupt there, and, by drawing the neighbouring parts into consent, will expose the patient to instant death. Therefore great care must be taken that the lips of the wound do not close till the blood which is collected in the cavity of the body be all evacuated, if possible; which may be easily perceived by the difficulty of breathing, and other bad symptoms, being removed: but if any of the larger internal vessels are wounded, then all attempts to discharge the blood are vain; for the violence of the hæmorrhage takes off the patient. 2. Wounds also are reckoned mortal by accident which are treated or searched in too rough a manner by the surgeon; for if wounds be handled roughly that are full of nervous parts or large blood-vessels, there is great danger of bringing on hæmorrhages, convulsion, inflammation, gangrene, and death itself. The case also is the same, 3. In external wounds which are slight of themselves, but the patient is lost by the violence of the inflammation which is brought on and increased by the surgeon's injudicious treatment. Or, 4. When any one is taken off by the violence of the hæmorrhage from a wound of the head or foot; for in this case a surgeon might easily have stopped the blood by the application of proper remedies, or by ligature. Or, 5. Where the patient is guilty of any intemperance in eating or drinking, of excess of any passion, of exposing himself to the cold air, or of using any violent exercise; for by this means wounds, more especially those of the head, by being liable to fresh hæmorrhages and other dangerous accidents, frequently become mortal, notwithstanding the surgeon uses his utmost care and skill. Under this head also are to be reckoned, 6. Those wounds of the head where the patient is lost by the vast quantity of blood which is extravasated in the cavity of the cranium, and confined there; but where he might have been relieved, if the trepan had been used in time; for though wounds of this kind generally prove incurable, yet, as there is a possibility of saving a person in these circumstances by the use of the trepan, this

may properly be reckoned amongst the doubtful cases, and not deemed absolutely mortal.

In examining wounds, the next consideration is, whether the parts injured are such as may be supposed to induce dangerous symptoms, either immediately or in some time during the course of the cure. In order to proceed here with any degree of certainty, it is necessary to be well acquainted with those symptoms which attend injuries of the different parts of the body. If the skin only and part of the cellular substance is divided, the first consequence is an effusion of blood; the lips of the wound retract, become tumefied, and red and inflamed; leaving a gap of considerable wideness, according to the length and deepness of the wound. Along with this inflammation, if a very considerable portion of skin and cellular substance is divided, a slight fever seizes the patient; the effusion of blood in the mean time stops, and the wound is partly filled up with a cake of coagulated blood. Underneath this cake, the small vessels pour forth a clear liquor, which in a short time becomes converted into pus*. Below this pus granulations of the new flesh arise, the cake of coagulated blood loosens, a new skin covers the place where the wound was, and the whole is healed up; only there remains a mark, called a *cicatrix* or *scar*, showing where the injury had been received.

articles Pus
and Mucus.

All wounds are accompanied with a considerable degree of pain, especially when the inflammation comes on; and this though the division reaches no farther than the skin and cellular substance. But if the muscular fibres are also divided, the pain is much greater, because the sound part of the muscle is stretched by the contraction of the divided part and the action of the antagonist muscle, which it is now less fitted to bear. The wound now also gaps much more than where the cellular substance only is divided, inasmuch that if left to itself the skin will cover the muscular fibres without any intervention of cellular substance, and not only a very unsightly cicatrix remains, but the use of the muscle is in some measure lost.—If the muscle happens to be totally divided, its parts retract to a very considerable distance; and unless proper methods be taken, the use of it is certainly lost ever afterwards.

³³
Of wounds
of the mus-
cles, of the mus-

If by a wound any considerable artery happens to be divided, the blood flows out with great velocity, and by flarts distinguishing the pulse of the artery; the patient soon becomes faint with loss of blood; nor does the hæmorrhage stop until he faints away altogether, when the ends of the divided vessel close by their natural contractility; and if as much *vis vite* still remains as is sufficient to renew the operations of life, he recovers after some time, and the wound heals up as usual. The part of the artery which is below the wound in the mean time becomes useless, and its sides collapse, so that all the inferior part of the limb would be deprived of the vital fluid, were it not that the small branches sent off from the artery above the wounded place become enlarged and capable of carrying on the circulation. Nature also, after a wonderful manner, often produces new vessels from the superior extremity of the divided artery, by which the circulation is carried on as formerly. However, the consequences of such a profuse hæmorrhage may be very dangerous to the patient, by inducing

of these
wounds,
ex-

extreme debility, polypous concretions in the heart and large vessels, or an universal dropy in case the patient recovers. This happens especially where the artery is partially divided; because then the vessel cannot contract in such a manner as to close the orifice: however, if the wound is but small, the blood gets into the cellular substance and intestines of the muscles, swelling up the member to an extreme degree, forming what is called a *spurious aneurism*. Thus the hemorrhage soon stops externally; but great mischiefs are apt to flow from the confinement of the extravasated blood. This is now found to have the power of dissolving not only the fleshy parts, but also the bones themselves; and thus not only the use of the limb is entirely lost, but the patient is brought into great danger of his life, if proper assistance be not obtained in a short time.—It not frequently happens, that when a large artery has been wounded or totally divided, so that the parts which were wont to be supplied with blood by that vessel become totally or in great measure deprived of it, a mortification then ensues which cannot be prevented or cured: in some cases the limb remains paralytic or insensible through life.

Wounds of the membranes, nerves, or tendons, are attended with the most direful symptoms. The peculiar symptom indeed which attends a wounded membrane is an erysipelas. This is to a membrane what a simple inflammation is to a fleshy part: and hence the danger of an erysipelas of the face more than of any other part of the body; for there is such a connection between the external and internal membranes all over the body, that an affection of the one seldom fails to bring on an affection of the other. When a nerve or tendon is entirely divided, the pain is but trifling, though the consequences are often dangerous. If the nerve is large, all the parts to which it is distributed below the wound immediately lose the power of motion and sensation; nor is it uncommon, in such cases, for them to be seized with a gangrene. This, however, does not hold universally. According to Dr Kirkland, it takes place only when all or the greatest part of the nerves belonging to a particular part are divided or tied. "If the spinal marrow" says he, "is divided near to the head, we know the parts below soon lose their action irrecoverably; or if the bundle of nerves passing out of the æilla were divided or tied, sensation in the greatest part of the arm below would probably be lost. But we all know, that in performing the operation for an aneurism in the arm, if the nerves which accompany the brachial artery are tied, a temporary numbness is only felt, and sensation in any degree below the ligature is not lost.—I have seen the superior cubital nerve torn asunder above the elbow, in a gun-shot wound, with considerable loss of substance; and a temporary palsy only was the consequence."

When the tendon belonging to any muscle is totally divided, that muscle immediately exerts its contractile power; the divided ends of the tendon are removed to a considerable distance; and, unless proper assistance is obtained, the action of the muscle is ever lost. But when either nerve or tendon happens to be partially divided, the case is much worse. The distraction of the parts which remain whole, occasion-

ed by the divided parts contracting themselves, occasions the most excruciating pain, which frequently terminates in convulsions of the worst kind, particularly those most fatal spasms termed *tetanus* and *opisthotonus*, which often attend wounds in nervous or tendinous parts.

Wounds which penetrate the cavities of the thorax or abdomen are always exceedingly dangerous, because there is scarce a possibility of all the viscera escaping unhurt. A wound is known to have penetrated the cavity of the thorax principally by the discharge of air from it at each inspiration of the patient, by an extreme difficulty of breathing, coughing up blood, &c. Such wounds, however, are not always mortal, though very frequently so. The lungs, may even the heart itself, may be wounded, and yet the patient recover. Van Swieten relates, that a stag was found to have a cicatrix of a wound formerly inflicted on the cone of its heart. The same author also is of opinion, that wounds even of the right ventricle are not absolutely mortal, as the force of contraction in this ventricle is not very great; however, it is otherwise when the left ventricle is wounded, the great force with which it contracts, continually dilating the wound, and extravasating the blood in such quantities, that life cannot possibly subsist.—Wounds of the diaphragm are almost always mortal, either by inducing fatal convulsions immediately, or by the ascent of the stomach, which the pressure of the abdominal muscles forces up through the wound into the cavity of the thorax; and of this Van Swieten gives several instances.—Even though the wound does not penetrate into the cavity of the thorax, the very worst symptoms may follow. For if the wound defends deeply among the muscles, and its orifice lies higher, the extravasated humours will be therein collected, stagnate, and corrupt in such a manner as to form various sinuses; and after having eroded the pleura, it may at length pass into the cavity of the thorax. The matter having once found a vent into this cavity, will be continually augmenting from the discharge of the sinuous ulcer, and the lungs at last consumed by soaking in corrupted matter. This is most to be dreaded from those sinuous ulcers which run behind the ribs; for there is then no opportunity either of compressing the parts, or dilating the wound in order to procure a discharge of the matter. If, in cases of wounds in the thorax, the ribs or sternum happen to become carious, the cure will be extremely tedious and difficult. Galen relates the case of a lad who received a blow upon his sternum in the field of exercise: it was first neglected, and afterwards badly healed; but, four months afterwards, matter appeared in the part which had received the blow. A physician made an incision into the part, and it was soon after cicatrized: but in a short time a new collection of matter made its appearance, and upon a second incision the wound refused to heal. Galen found the sternum carious; and having cut off the diseased part, the pericardium itself was observed to be corroded, so that the heart could be seen quite naked; notwithstanding which, the wound was cured in no very long time.

Great caution is necessary in determining whether the wound has really penetrated into the thorax or the abdomen: for the former defends much farther in

the back than in the fore part; and there are instances of surgeons penetrating the abdomen instead of the thorax, when attempting to perform the operation for an empyema. However, as the lungs are almost always wounded when the cavity of the thorax is penetrated, the symptoms arising from thence can scarcely be mistaken.—Another symptom which frequently, though not always, attends wounds of the thorax, is an emphysema. This is occasioned by the air escaping from the wounded lungs, and insinuating itself into the cellular membrane; which being pervious to it over the whole body, the tumour passes from one part to another, till at last every part is inflated to a surprising degree. An instance is given, in the Memoirs of the Royal Academy, of a tumour of this kind, which on the thorax was eleven inches thick, on the abdomen nine, on the neck six, and on the rest of the body four; the eyes were in a great measure thrust out of their orbits by the inflation of the cellular membrane; and the patient died the fifth day. This was occasioned by a stab with a sword.

50
Wounds of the intestines will sometimes heal spontaneously.

indeed the wound most commonly proves generally mortal where any considerable portion of the intestine has been protruded, even though itself should not be wounded.

When the mesentery is injured, the danger is extreme, both on account of the blood-vessels which are every where dispersed through it, and the membranous nature of the mesentery itself, which is as subject to the erysipelatous inflammation as the other membranes of the body. Wounds of the liver are also exceedingly dangerous, on account of the nature of that viscus; for as the circulation of the blood is there very slow, and the substance of the liver itself is exceedingly soft and tender, the smallest acrimony in the matter is sufficient to destroy the whole, by producing incurable abscesses. Wounds of the spleen and pancreas are said not to be dangerous; and there are even some instances of these parts being cut out of living animals without any considerable injury; but those of the kidneys, urinary bladder, and gall-bladder, are almost always mortal.

51
Wounds of the mesentery and liver are very dangerous.

52
But not those of the spleen and pancreas.

Wounds of the head, even though they penetrate only through the external integuments, are not without danger, chiefly on account of the danger arising from the membranes of the brain, the pericranium, and the concussion of the brain by the stroke of the wounding instrument. Even contusions on the head, without any external wound, have sometimes brought on the most violent symptoms, and this when every thing seemed for a while to be in a fair way. Mr Pott, in his excellent Treatise upon Injuries of the Head from external Violence, divides wounds of the head into two kinds, viz. lacerated wounds, and those made by puncture. The former he subdivides into other two kinds, viz. those in which the scalp, though torn or unequally divided, still keeps its natural situation, and is not separated from the cranium to any considerable distance beyond the breadth of the wound; and those in which it is considerably detached from the parts it ought to cover. The latter are the most dangerous; as in such cases the pericranium is most commonly inflamed, and communicates the injury to the membranes of the brain, whence follow the most fatal symptoms. Small wounds, or such as are made by instruments that pierce rather than cut, are in general more apt to be troublesome than those which are larger, and, in the head particularly, are sometimes attended with very alarming symptoms. The parts capable of being hurt by such wounds are the skin, tela cellulosa, the expanded tendons of the muscles of the scalp, and the pericranium. If the wound affects the cellular membrane only, and has not reached the aponeurosis or pericranium, the inflammation and tumour affect the whole head and face, the skin of which wears a yellowish cast, and is sometimes thick set with small blisters containing a serum of the same colour. It receives the impression of the fingers, and becomes pale for a moment, but returns immediately to its inflamed colour: it is not very painful to the touch, and the eyelids and ears are always comprehended in the tumefaction: the former are sometimes distended in such a manner as to be closed; a feverish heat and thirst generally accompany it; the patient is restless, has a quick pulse, and most commonly a nausea and inclination to vomit. This generally happens to persons of a bilious

53
Of wounds of the head.

54
Mr Pott's division of them into two classes.

55
Of those in which the scalp is separated from the cranium.

Wounds of the abdomen are not much less dangerous than those of the thorax, by reason of the importance of the viscera which are lodged there. When the wound does not penetrate the cavity, there is some danger of an hernia being formed by the dilatation of the peritonæum through the weakened integuments, and the danger is greater the larger the wound is. Those wounds which run obliquely betwixt the interstices of the muscles often produce sinuous ulcers of a bad kind. For as there is always a large quantity of fat interposed every where betwixt the muscles of the abdomen, if a wound happens to run between them, the extravasated humours, or matter there collected, not meeting with free egress through the mouth of the wound, often makes its way in a surprising manner through the panniculus adiposus, and forms deep sinuities between the muscles; in which case the cure is always difficult, and sometimes impossible.

If a large wound penetrates the cavity of the abdomen, some of the viscera will certainly be protruded through it; or if the wound is but small, and closed up with fat so that none of the intestines can protrude themselves, we may yet know that the cavity of the abdomen is pierced, and probably some of the viscera wounded, by the acute pain and fever, paleness, anxiety, faintings, hiccup, cold sweats, and weakened pulse, all of which accompany injuries of the internal parts. The mischiefs which attend wounds of this kind proceed not only from the injury done to the viscera themselves, but from the extravasation of blood and the discharge of the contents of the intestines into the cavity of the abdomen; which, being of a very putrescent nature, soon bring on the most violent disorders. Hence wounds of the abdominal viscera are very often mortal, though not always so. It appears, that the small intestines have been totally divided, and yet the patient has recovered. Wounds both of the small and large intestines have healed spontaneously, even when they were of considerable magnitude; so that both the contents of the intestine have been freely discharged thro' the wound in it, and part of the intestine itself has been protruded through the wound of the integuments. When this last is the case, however, there is great danger from the mere contact of the external air; and

bilious habit, and is indeed an inflammation of the erysipelatous kind; but though its appearance is alarming, it is not often attended with danger. The wound does indeed neither look well, nor yield a kindly discharge while the fever continues; but till the scalp continues to adhere firmly to the skull, and the patient does not complain of that tense pain, nor is afflicted with that fatiguing restlessness, which generally attends mischief underneath the cranium.

56
Of such as
affect the
brain and its
membranes.

Wounds and contusions of the head which affect the brain and its membranes are also subject to an erysipelatous kind of swelling and inflammation, but very different both in its character and consequences from the preceding. In this the febrile symptoms are much higher; the pulse harder and more frequent; the anxiety and restlessness extremely fatiguing; the pain in the head intense, and generally attended with irregular shiverings, which are not followed by a critical sweat, nor afford any relief to the patient. These shiverings are most frequently a sign of matter forming between the dura mater and the skull; and indeed shivering generally accompanies the formation of matter in any part of the body, as shall be explained when we come to treat of abscesses. In the former case, the erysipelas generally appears within the first three or four days; whereas in the latter it seldom comes on till several days after the accident, when the symptomatic fever is got to some height. In the simple erysipelas, although the wound be undigested, yet it has no other mark of mischief; the pericranium adheres firmly to the skull, and upon the cessation of the fever all appearances become immediately favourable. In that which accompanies injury done to the parts underneath, the wound not only has a spongy, glassy, unhealthy aspect; but the pericranium in its neighbourhood separates of its own accord from the bone, and quits all cohesion with it. These appearances indicate great danger, and commonly end in death.

57
Of wounds
which pass
through all
the integu-
ments to the
pericra-
nium.

If the wound be a small one, and has passed thro' the tela cellulosa to the aponeurosis and pericranium, it is sometimes attended with very alarming symptoms. The inflamed scalp does not arise to such a degree of tumefaction as in the erysipelas, neither does it pit or retain the impression of the fingers. It is of a deep red colour, unmixed with the yellow tint of the erysipelas; it appears tense, and is extremely painful to the touch. As it is not an affection of the tela cellulosa, and as the ears and the eye-lids are not covered by the parts in which the wound is inflicted, they are seldom, if ever, included in the tumour, though they may partake of the general inflammation of the skin: it is generally attended with acute pain in the head, and such a degree of fever as prevents sleep, and sometimes brings on a delirium.

58
Of those
where the
skull is cleft,
or part of it
cut off.

In violent wounds of the head, it not unfrequently happens that the skull is cleft, or even a part of it entirely taken off, sometimes with and sometimes without injuring the brain. These wounds, though very dangerous, are not always mortal, unless the medullary substance of the brain be injured; for this never fails to bring on death in a short time. There have been instances of people who by wounds of this kind had a considerable portion of the dura mater exposed for the remainder of their life, and yet felt no remarkable inconvenience, farther than that the brain was exceed-

ingly tender; and they felt great pain, giddiness, dimness of sight, &c. even on a slight pressure of that part.

In wounds of the joints there is always a considerable difficulty of cure, by reason of the efflux of the synovia, which serves for lubricating the parts; and there is also great danger on account of the number of tendons, ligaments, and synovial glands, which are situated about the articulations. In this case, small wounds are more dangerous than large ones, especially when the former cannot be enlarged. The danger is least when the wound is situated in the upper part of the joint, and has not penetrated through the capsular ligament. The symptoms attending a wounded joint are, violent pain, inflammation, &c. with an efflux of thick whitish matter almost of the consistence of honey, called *melicera*, and is indeed no other than the synovia which lubricates the joint. This flux it is very difficult to restrain, and by it the wound is prevented from healing: at last the wound degenerates into an ulcer with callous lips, which ends in an incurable fistula; and even if the wound should at last be healed up, the joint for the most part remains stiff and contracted, so that the limb cannot be stretched out.

From the preceding account of the symptoms attending wounds in the different parts of the body, the surgeon may be enabled to judge in some measure of the event; though it must always be remembered, that wounds, even those which seemed to be of the slightest nature, have, contrary to all expectation, proved mortal, chiefly by inducing convulsions or a locked jaw; so that no certain prognostic can be drawn on sight of recent wounds. We shall now, however, proceed to consider their treatment.

For the cure of wounds, it has been already observed, that the ancients imagined balsams, the juice of herbs, &c. to be a kind of specifics. In after-ages, and in countries where balsams are not easily to be procured, salves have been substituted in their place; and even at this day there are many who reckon a salve or ointment essentially necessary for healing the slightest cut. It is certain, however, that the cure of wounds cannot be effected, nay, not even forwarded in the least, by ointments, unless in particular cases or by accident. That power which the human frame has of repairing the injuries done to itself, which by physicians is called *vis medicatrix nature*, is the sole agent in curing external injuries, and without this the most celebrated balsams would prove ineffectual. There are three stages to be observed in the cure of a wound: the first, called *digestion*, takes place when the ends of the wounded vessels contract themselves, and pour out the liquor which is converted into pus. As soon as this appears, the second stage, in which the flesh begins to *grow up*, takes place; and as this proceeds, the edges of the wound acquire a fine bluish or pearl colour, which is that of the new skin beginning to cover the wound as far as the flesh has filled it up. This process continues, and the skin advances from all sides towards the centre, which is called the *cicatrizing* of the wound. For the promoting of each of these processes, there were ointments formerly much in vogue. A composition of turpentine and the yolk of an egg was named *digestive ointment*, from the power it was supposed to have of promoting the formation of pus; balsicum and other ointments were supposed to promote

63
None of these can be promoted by any ointment.

mote the growth of flesh, and there were ointments also for cicatrizing. But it is now found, that no ointment whatever is capable of promoting these operations; and it is only necessary to keep the wound clean, and to prevent the air from having access to it. This, indeed, nature takes care to do by covering the wounded part with a cake of coagulated blood; but if a wound of any considerable magnitude should be left entirely to nature, the pus would form below the crust of coagulated blood in such quantity, that it would most probably corrupt, and the wound degenerate into a corroding ulcer. It is necessary, therefore, to cleanse the wound once a-day; and for this purpose it will be proper to apply a little ointment spread on soft scraped lint. For the first dressing, dry lint is usually applied, and ought to be allowed to remain for two or three days, till the pus is perfectly formed; after which the ointment may be applied as just now directed; and, in a healthy body, the wound will heal without further trouble. As to the ointment employed, it is almost indifferent what it be, provided it has no acrid or stimulating ingredients in its composition; and hence the digestive ointment above-mentioned is rather hurtful than otherwise, on account of the stimulating nature of the turpentine which makes part of its composition.

65
Where future is necessary.

But though, in general, wounds thus easily admit of a cure, there are several circumstances which require a different treatment, even in simple divisions of the fleshy parts, when neither the membranous nor tendinous parts are injured. These are, 1. Where the wound is large, and gapes very much, so that, if allowed to heal in the natural way, the patient might be greatly disfigured by the scar. In this case, it is proper to bring the lips of the wound near to each other, and to join them by future, either of the dry or bloody kind, as the wound is more superficial or lies deeper.

66
Of extracting foreign bodies.

2. When foreign bodies are lodged in the wound, as when a cut is given by glass, &c. it is necessary by all means to extract them before the wound is dressed; for it will never heal until they are discharged. Sometimes it happens that these bodies are situated in such a manner as not to be capable of being extracted without lacerating the adjacent parts, which would occasion violent pain and other bad symptoms. In this case it is necessary to enlarge the wound so that these offending bodies may be easily removed. This treatment, however, is chiefly necessary in gunshot wounds, of which we shall treat in the next section.

67
Of using compresses, &c.

3. When the wound is made in such a manner that it runs for some length below the skin, and the bottom is much lower than the orifice. In this case, the matter collected from all parts of the wound will be lodged in the bottom of it, where, corrupting by the heat, it will degenerate into a fistulous ulcer. To prevent this, we must use compresses, applied so that the bottom of the wound may suffer a more considerable pressure than the upper part of it. Thus the matter formed at the bottom will be gradually forced upwards, and that formed at the upper part will be incapable of descending by its weight; the divided parts in the mean time easily uniting when brought close together. Indeed, the power which nature has of uniting divided parts of the human body is very surprising; for, according to authors of credit, even if a piece of flesh

is totally cut out, and applied in a short time afterwards to the place from whence it was cut, the two will unite. On this principle Taliacotius, professor at Bologna, pretended to restore lost parts, as noses, ears, lips, &c. by cutting out a piece of the arm and adapting it to the part. But though these are justly looked upon to be ridiculous pretensions, we are certain that a part cut out of a living body does not entirely lose its vital power for some time, as is evident from the modern practice of transplanting teeth; and from an experiment of Dr Hunter's at London, where he put the testicle of a cock into the belly of a living hen, which adhered to the liver, and became connected to it by means of blood-vessels *. We have therefore the greatest reason to hope, that the divided parts of the human body, when closely applied to each other, will cohere without leaving any sinus or cavity between them. However, if this method should fail, and matter still be collected in the depending part of the wound, it will be necessary to make an opening in that part in order to let it out; after which, the wound may be cured in the common way.

* See Blood, p. 19.

68
Of taking away fungous flesh.

4. During the course of the cure it sometimes happens, that the wound, instead of filling up with fleshy granulations of a florid colour, shoots up into a glassy-like substance which rises above the level of the surrounding skin, at the same time that, instead of laudable pus, a thin ill-coloured and fetid ichor is discharged. In this case the lips of the wound lose their beautiful pearl colour, and become callous and white, nor does the cicatrizing of the wound at all advance. When this happens in a healthy patient, it generally proceeds from some improper management, especially the making use of too many emollient and relaxing medicines, an immoderate use of balsams and ointments. Frequently nothing more is requisite for taking down this fungus than dressing with dry lint; at other times desiccative powders, such as calamine, tutty, calcined alum, &c. will be necessary; and sometimes red precipitate mercury must be used. This last, however, is apt to give great pain, if sprinkled in its dry state upon the wound; it is therefore most proper to grind it with some yellow balsamic ointment, which makes a much more gentle, though at the same time efficacious, escharotic. Touching the overgrown parts with blue vitriol is also found very effectual.

Hitherto we have considered the wounded patient as otherwise in a state of perfect health; but it must be observed, that a large wound is capable of disordering the system to a great degree, and inducing dangerous diseases which did not before exist.—If the patient is strong and vigorous, the pain and inflammation of the wound great, a considerable degree of fever may arise, which it will be necessary to check by bleeding, low diet, and other antiphlogistic regimen, at the same time that the inflamed lips of the wound and parts adjacent are to be treated with emollient fomentations or cataplasms till the pain and swelling abate. On the other hand, it may happen, when the patient is of a weak and lax habit, that the vis vitæ may not be sufficient to excite such an inflammation in the wound as is absolutely necessary for its cure. In this case, the edges of the wound look pale and soft; the wound itself ichorous and bloody, without any signs of fleshy granulations; or if any new flesh shoots

Theory.

Theory.

up, it is of the fungous glassy kind above-mentioned. To such wounds all external applications are vain; it is necessary to strengthen the patient by proper internal remedies, among which the bark has a principal place, until the wound begins to alter its appearance. In such persons, too, there is some danger of a hectic fever by the absorption of matter into the body when the wound is large; and this will even take place during the course of the cure, even when the appearances have been at first as favourable as could be wished. This happens generally when the wound is large, and a great quantity of matter formed: for by this discharge the patient is weakened, so that the pus is no sooner formed, than it is by the absorbent vessels re-conveyed into the body, and feverish heats immediately affect the patient. For this the best remedy is to exhibit the bark copiously, at the same time supporting the patient by proper cordials and nourishing diet. Indeed, in general, it will be found, that, in the case of wounds of any considerable magnitude, a more full and nourishing regimen is required than the patient, even in health, has been accustomed to; for the discharge of pus alone, where the quantity is considerable, proves very debilitating, if the patient is not strengthened by proper diet. And it is constantly found, that the cure of such sores goes on much more easily when the patient is kept in his usual habit of body, than when his system is much emaciated by a very low allowance; and, for the same reason, purgatives, and whatever else tends to weaken the constitution, are improper in the cure of wounds.

70
Of hæmorrhages.

Hæmorrhages very frequently happen in wounds, either from a division of one large artery, or of a number of small ones. In this case, the first step to be taken by the surgeon is to effect a temporary stoppage of the blood by means of strong compression. In the head, as well as in the trunk of the body, the easiest method of applying pressure of this kind is by means of dossils of linen or charpie, held firmly upon the mouths of the bleeding vessels, either by the hands of an assistant or the use of a proper bandage: but it is better when pressure can be applied to the superior part of the artery, as it not only secures the vessel equally well, but admits of the necessary ligature being applied with greater freedom. Where accidents of this kind, therefore, happen to any of the limbs, and pressure can be made on the superior part of the artery, the tourniquet is immediately to be applied.

71
Ancient surgeons were not so deficient in the knowledge of stopping hæmorrhages.

The patient being in this manner secured from immediate danger, the surgeon must take the proper means for preventing any return. In this the ancients were extremely defective. Being ignorant of the use of the tourniquet, and equally so of the method of tying up blood-vessels, they could only apply dossils of linen covered with astringent powders for the small arteries, and for the larger ones they had no other resource but searing with red-hot irons. This cruel remedy they applied even in cases of amputation; and we find that some ancient chirurgical writers ordered the flesh to be divided down to the bone by a red-hot knife: but the effects even of this are by no means to be depended upon farther than as a temporary relief; for, in general, the pulsation of the larger arteries soon overcomes all resistance from the eschar occasioned by

the cautery. Styptic powders are still less efficacious; and though sponge, agaric, and fungous substances of various kinds, have been recommended even by the more skilful modern surgeons, yet the application of the ligature, and that alone, can be depended upon where the larger arteries are divided. In performing this operation there are two different methods; one in which the nerve which runs along with the artery, depending and part of the circumjacent muscles, are taken in with the artery in the ligature; the other, in which the divided artery is taken hold of by a pair of forceps, or by an hooked instrument called the *tenaculum*, and tied up by itself. The former method is liable to great objection, on account of the violent symptoms it occasions; particularly extreme pain, spasms, and convulsions, not only of the part affected, but even of the whole system.

Spasmodic twitches are frequently found to occur after the amputation of limbs, and are often the source of much distress. In some instances they are no doubt to be considered as the effect of other causes; but in various cases it has happened, that demonstrative proof has been obtained of their arising from the ligatures of arteries having been applied in an improper manner. When such convulsive affections occur after amputations, and the usual means of preventing them have failed, effectual relief may be frequently obtained by destroying the ligatures altogether, so as to remove the compression upon the nerves; care being taken at the same time to renew the ligatures upon the arteries immediately, without comprehending any of the contiguous parts.

Practitioners have commonly been afraid of tying up blood-vessels by themselves without the intervention of some of the surrounding parts, on the supposition of the coats of arteries not being of a sufficient firmness for bearing that degree of compression necessary for the prevention of hæmorrhagy. This, however, originates from an idea of the coats of arteries not being so strong as they really are, and of a great degree of force being necessary for compressing the sides of arteries into close contact with one another. But it is now well known, that even very small arteries are possessed of much firmness; and it is also certain, that, even in the largest arteries of the arm or thigh, a very slight degree of compression is fully sufficient, not only for restraining hæmorrhagy, but for securing the ligature on the very spot to which it is first applied; and in small vessels the force necessary for this purpose is trifling indeed, being far less than is commonly practised. It has also been objected to this mode of securing blood-vessels by themselves, that the ligatures, although they should not cut the arteries through, yet are more apt to slip than when some of the surrounding parts are comprehended along with them; and, in some instances, it is said that arteries retract so far, that they cannot in any other way be laid hold of than by means of the crooked needle in the ordinary method. Long and repeated experience, however, of a few individuals, of this mode of taking up arteries by themselves, has put the fact beyond a doubt, that it is equally secure as any other yet invented (A).—Fatal hæmorrhages after capital operations, either from inattention or some

72

Theory.

Theory.

other cause, do now and then indeed happen in the hands of the most able practitioners; but occurrences of this nature have as frequently happened when the curved needle was employed, as when the blood-vessels were secured by themselves without any of the contiguous parts being included.

In a few instances it may happen, that a bleeding vessel, from lying at the bottom of a deep wound, cannot be laid hold of in any other manner than by the curved needle being made to pass round it. Such occurrences, however, are exceedingly rare. Among other advantages which the tying of arteries by means of the tenaculum has over the old mode of operating, there is still one we have not yet taken notice of. It often happens, after amputations and other operations where the larger arteries have been tied, that the ligatures do not come easily away, from being made to run so deep as with the curved needle is commonly necessary. In some instances much pain and trouble has occurred from this circumstance, the ligature remaining quite immovable for a great many weeks: and after all, we have seen it necessary for the surgeon to put the patient to a great deal of pain, by being obliged to cut out the threads with a scalpel. But when the tenaculum is used, every risk of this kind is effectually avoided, from the ligatures generally falling off of their own accord, in the course of the third or fourth dressing of the fore.

From what has been said, therefore, we shall consider it as a practice that ought to be established, that, in forming the ligature of arteries, the nerves and other contiguous parts should be carefully avoided.

The principal artery being in this manner secured, all the vessels or the part must one after another be taken up in the same manner, by first loosening the tourniquet in order to discover them, and afterwards applying the ligature to each in the manner directed. It often happens, however, that the loss of blood the patient has sustained, a tendency to delirium which may take place for the time, the fear he labours under, and the degree of cold to which the fore is exposed, have all together such an effect upon the smaller arteries, as to prevent them for the time from discharging their contents; and as arteries left in such a state without being secured, generally burst out on the removal of these causes, a circumstance which always occasions much trouble to the practitioner, as well as a great deal of pain to the patient, every surgeon therefore ought to pay the nicest attention to this point. The tourniquet should be made perfectly loose; any coagulated blood on the surface of the fore ought to be carefully washed off with a sponge and warm water; and the patient, if faintish, ought to get a glass of wine or some other cordial; and after all, the surgeon ought to examine, with the most minute attention, the usual course which the vessels of the part are known to take. This being done, every artery of the part, even the smallest that can be distinguished, ought to be secured with a ligature: for such vessels as appear exceedingly trifling while the part is yet exposed to the air, after the patient becomes warm in bed, when of course the solids become relaxed and the fluids expand, even the smallest branches of arteries that happen to be neglected, will now be capable of producing much mischief, by discharging very considerable quantities

of blood; and, as little or no injury can ever occur by the proper application of ligatures to all the arteries that present themselves, the greatest attention ought at all times to be paid to this circumstance.

When the principal arteries of a lump or other large wound have been taken up, and a little blood continues to be discharged, but appears to come from sundry small vessels only, the surgeon, unless he is much accustomed to this kind of business, is induced to think, that as they are very trifling to appearance, so he need not be at the trouble of tying them, as the necessary compression of the bandages proper for the wound will in all probability effect a total stoppage of the hæmorrhage. In a general oozing of a small quantity of blood from the whole surface of a fore, and when no particular vessel can be distinguished, there is a necessity for trusting to this remedy; but whenever an artery can be discovered, of whatever size it may be, it ought unquestionably to be secured by a ligature. It very rarely happens that any inconvenience occurs from ligatures when properly applied; but many lives have been lost from a remissness in this article. But when, from the deepness of a wound, or from any other cause, some particular artery cannot be properly secured by the tenaculum, in this case we are under the necessity of employing the crooked needle. But it frequently happens, that considerable quantities of blood are discharged, not from any particular vessel, but from all the small arteries over the surface of the fore. In wounds of great extent, particularly after the extirpation of cancerous breasts, and in other operations where extensive fores are left, this species of hæmorrhage often proves very troublesome by being exceedingly difficult to suppress.

Bleedings of this kind seem evidently to proceed from two very different and opposite causes. First, Either from too great a quantity of blood contained in the vessels, or from an over-degree of tone in the vessels themselves; or, perhaps, from a combination of both these causes. But, secondly, Such evacuations undoubtedly happen most frequently in such constitutions as are very relaxed and debilitated; either from a putrid dissolved state of the blood, or from a want of tone in the containing vessels, or, in some instances, from a concurrence of both.

In constitutions perfectly healthy, when the fluids are not tainted with any degree of putrescency, and the solids are possessed of their natural tonic powers, on the occurrence of wounds even of the most extensive nature, as soon as the larger arteries are secured, all the small vessels that have been divided, in consequence of that contractile power with which in a state of health they are endowed, and from the stimulus of the external air to which they are now exposed, are diminished not only in their diameters, but also in their length; in consequence of which, they recede considerably within the surface of the surrounding parts. This cause of itself would probably in the greatest number of instances prove sufficient for restraining all loss of blood from the smaller arteries; but, in the found state of constitution of which we have now been speaking, another very powerful agent is provided by nature for producing the same effect. From the extremities of the divided vessels which at first discharged red blood only, there now, in their contracted state, oozes out a

more thin, though viscid fluid, containing a great proportion of the coagulable parts of the blood; and this being equally distributed over the surface of the wound, by its balsamic agglutinating powers has undoubtedly a very considerable influence in restraining all such hæmorrhages.

In constitutions altogether healthy, where neither of the states of disease we have alluded to preponderates over the other, we find, that as soon as the larger arteries of wounds are secured, nature, in the manner already described, generally puts a stop to all farther discharge. So that, whenever the contrary happens, by a tedious oozing continuing from the surface of the sore, we ought then to pay particular attention to the habit of body with which it is connected.

80
When phlebotomy is
useful.

When such an occurrence happens in a patient young and vigorous, and where the tone of the muscular fibres is evidently great, the most effectual means of putting a stop to the discharge is to relax the vascular system, either by opening a vein in some other part, or, what gives still more immediate relief, by untying the ligature on one of the principal arteries of the part, so as to allow it to bleed freely: those violent spasmodic twitchings too, so frequent after operations on any of the extremities, when they do not depend on a nerve being included in the ligature with the artery, are in this manner more effectually relieved than by any other means.

By the same means the patient, from being in a febrile heat and much confused, soon becomes very tranquil: the violent pulsation of the heart and larger arteries abates, and the blood not being propelled with such impetuosity into the smaller vessels of the part, they are thereby left at more liberty to retract; and as in this state they do not pour forth red blood so freely, they are the more readily covered with that viscid glutinous fluid which we have already shown to be one of the most important means intended by nature for the prevention of such hæmorrhages. At the same time that, by the means recommended, we endeavour to allay the commotion produced in the system, the patient ought to be kept exceedingly cool; wine and other cordials should be rigidly avoided; cold water, acidulated either with the mineral or vegetable acids, ought to be the only drink; motion of every kind, particularly of the part affected, should be guarded against; and the wound being gently covered with soft charpie, ought to be tied up with a bandage so applied as to produce a moderate degree of pressure on the extremities of the divided parts.

81
Opiales.

In every extensive wound attended with hæmorrhages of this kind, and particularly when violent spasmodic affections of the muscles supervene, together with the means already recommended large doses of opiates are found highly beneficial; for whatever hurtful effects may have been apprehended from opiates in some inflammatory affections, every practitioner who has ventured on a free use of them must admit, that in all occurrences of this nature their influence far surpasses that of any other remedy.

As soon therefore as a sufficient quantity of blood has been discharged, and the wound being dressed and the patient laid to rest, a dose of opium proportioned to the violence of the symptoms ought to be immediately exhibited. It ought to be remarked, however,

that in all such circumstances, much larger doses of the remedy are necessary than in ordinary cases requiring the use of opiates. Small doses, instead of answering any good purpose, seem frequently rather to aggravate the various symptoms; so that whenever they are here had recourse to, they ought always to be given in quantities sufficient for the intended effect.

82
Hæmorrhages most frequent in lax habits

Although hæmorrhages of this nature do now and then occur in firm vigorous constitutions, yet they undoubtedly happen much more frequently in relaxed enfeebled habits, where the solids have lost part of their natural firmness, and the fluids have acquired some degree of putrescency. As the vessels in this situation of matters are supposed to have been deprived of that degree of tone of which we wish them to be possessed, instead of restraining the patient from the use of cordials, as is done usually in every case of hæmorrhagy, a moderate use of generous wine ought to be immediately prescribed; for nothing, it may be observed, tends so much, in such circumstances, to restrain hæmorrhages, as a well-directed use of proper cordials. By tending to invigorate and brace the solids, they thereby enable the arterial system to give a due resistance to the contained fluids; and the same cause, it may be observed, has a considerable influence in restoring to the fluids that viscosity of texture, of which in all such instances we suppose them to be deprived.

83
Use of wine and cordials in such cases.

Whenever, therefore, such tedious hæmorrhages occur in relaxed debilitated habits, a free use of Port, Madeira, or any other wine whose strength and goodness can be depended on, ought to be immediately allowed; a nourishing diet also becomes proper; the patient ought to be kept cool; and the mineral acids, from their known utility in every species of hæmorrhagy, ought also to be prescribed. Rest of body is here proper too; and opiates, when indicated either by pain or spasmodic affections of the muscles, ought never to be omitted.

84
External applications.

Together with these remedies adapted to the general system, particular dressings, appropriated to the state of the parts to which they are to be applied, have been found very beneficial. We have already remarked, that in firm healthy constitutions, as soon as the discharge of blood which naturally occurs in every large wound is over, the parts come soon to be covered with a viscid coagulable effusion from the mouths of the now retracted arteries; but in constitutions of an opposite nature, where the solids are much relaxed, the blood in general is found in such a dissolved state as to afford no secretion of this nature.

In order therefore to supply as much as possible the deficiency of this natural balsam, different artificial applications have been invented. Dusting the part with starch or wheat-flour, has sometimes been found of use; and gum arabic in fine powder has been known to answer when these failed.

85
Alcohol

Applications of this kind, indeed, have been used with success in all such hæmorrhages, with whatever habit of body they happen to be connected; but they have always proved more particularly serviceable in relaxed constitutions, attended with a dissolved state of the blood and an enfeebled muscular system. We may here use with freedom, too, a remedy which in such circumstances generally proves serviceable, but which, when used in constitutions of an opposite nature, ought never to fail.

Theory. be employed. The remedy alluded to is alcohol, or any other ardent spirits, impregnated with as great a quantity as they can dissolve of myrrh or any other of the heating viscid gums. The balsamum traumaticum of the shops, a remedy of this nature, has long been famous for its influence in such cases; but that indiscriminate use of this and similar applications which has long prevailed with some practitioners, has undoubtedly done much harm; for as they are all possessed of very stimulating powers, they of course tend to aggravate every symptom in wounds connected with a tense state of fibres, when much pain, and especially when spasmodic muscular affections prevail. But in constitutions where the blood appears to be in a dissolved state, and where the arterial system seems evidently to require a stimulus, remedies of this class come to be very useful; inasmuch that, in every constitution of this kind where hæmorrhages prove troublesome, no application whatever is found to answer better than charpie immersed in an agglutinating spirituous balsam of this nature.

86
Pressure to be used when every other method fails,

By a due perseverance in one or other of the plans here pointed out, it will seldom happen that hæmorrhages of this nature are not at last put a stop to: but when the contrary does occur, when, notwithstanding the use of the remedies recommended, a discharge of blood still continues, together with the means already advised, an equal moderate pressure ought to be applied over the whole surface of the fore, to be continued so long as the necessity of the case seems to indicate.

In finishing the dressings of such wounds, after the charpie and compresses have been applied, a bandage properly adapted to the part ought to conclude the whole, and in such a manner as to produce as equal a degree of pressure over the surface of the fore as possible. But it now and then happens that no bandage whatever can be so applied as to produce the desired effect; and in such cases the hand of an assistant is the only resource. In these instances, a person's hand being firmly applied over the dressings so as to produce a very equal degree of pressure, will commonly succeed when no other remedy is found to have much influence.

87
Of wounds of the nerves, &c.

88
Sometimes happen in blood-letting.

89
Symptoms of a punctured nerve or tendon.

Wounds of the nerves, tendons, and membranes, as they are attended with much more violent symptoms than those where even considerable arteries are divided, so they frequently resist every method of cure proposed by the most skilful practitioners. In the simple process of blood-letting, it frequently happens that the tendinous expansion called the *aponeurosis* of the biceps muscle is wounded, or even the tendon of that muscle itself is punctured, by the point of the lancet; or sometimes a nerve which happens to lie in the neighbourhood is partially divided. Any one of these wounds, though they are the smallest we can well suppose to be given, are frequently very dangerous and difficult of cure. It sometimes immediately happens on the introduction of the lancet, that the patient complains of a most exquisite degree of pain; and when this occurs, we may rest assured that either a nerve or tendon has been wounded. On some occasions, by proper management, such as evacuating a considerable quantity of blood at the orifice newly made, by keeping the part at perfect rest, and preserving the patient in as cool a state as possible, the pain at first complain-

ed of will gradually abate, and at last go off entirely, without any bad consequence whatever. At other times, however, this pain which occurs instantaneously on the introduction of the lancet, instead of abating, begins soon to increase; a fullness, or small degree of swelling, takes place in the parts contiguous to the wound; the lips of the fore become somewhat hard and inflamed; and, in the course of 24 hours or so from the operation, a thin watery serum begins to be discharged at the orifice.

If by the means employed relief is not soon obtained, these symptoms generally continue in nearly the same state for two or perhaps three days longer. At this time the violent pain which at first took place becomes still more distressing; but instead of being sharp and acute as before, it is now attended with the sensation of a burning heat, which still goes on to increase, and proves, during the whole course of the ailment, a source of constant distress to the patient. The fullness and hardness in the lips of the wound begin to increase, and the swelling in the neighbouring parts gradually extends over the whole member; from the foot upwards over the thigh, when the operation has been done in the lower extremity; and from the elbow down the fore-arm, and along the humerus over to the pectoral muscle and other contiguous parts, when the accident has occurred at the usual place of blood-letting in the arm. The parts at last become exceedingly tense and hard; an erysipelatous inflammatory colour frequently appears over the whole member; the pulse by this time has generally become very hard and quick; the pain is now intense, the patient exceedingly restless; twichings of the tendons occur to a greater or lesser degree; on some occasions, a locked jaw and other convulsive affections supervene; and all these symptoms continuing to increase, it most frequently happens, that the torture under which the patient has been groaning is at last terminated by death.

Different opinions have prevailed respecting the cause of these symptoms. By some they have been imputed to wounds of the tendons. By others the tendons are supposed to be so entirely destitute of sensibility, as to be quite incapable of producing so much distress; so that wounds of the nerves they consider on all such occasions as the true cause of the various symptoms we have mentioned.

One or other of these ideas continued to be the only source for explaining the various phenomena found to occur in this malady, till a different opinion was at last suggested by the ingenious Mr John Hunter of London. Mr Hunter supposes, that all the dreadful symptoms found now and then to be induced by the operation of blood-letting, may be more readily accounted for from an inflamed state of the internal surface of the vein, than from any other cause. Such a state of the vein he has often traced in horses that have died of such symptoms from venesection, where the internal coat of the vein was always found much inflamed, not only in the neighbourhood of the part where the orifice was made, but on some occasions the inflammation extended along the whole course of the vein, and seemed at last to reach the heart itself. Some instances, too, have occurred, of the same appearances in the human body, where the veins after death were found in a state of high inflammation. And on other occasions,

Theory.

90
Mr Hunter's explanation of these symptoms.

inflammation having in this manner been once excited, has been known to terminate in suppuration; and the matter thus produced being in the course of circulation carried to the heart, Mr Hunter supposes that in such cases death may have been induced by that cause alone.

91
Bel's Surgery, p. 113
Objections to his hypothesis.
There can be no reason to doubt the fact held forth by Mr Hunter, that in such instances the vein in which the orifice has been made has frequently after death been found greatly inflamed: but however ingenious his arguments may be for concluding that this state of the vein is the original cause of all the bad symptoms enumerated, and although we must allow that such an inflammatory affection of a vein must have a considerable influence in aggravating the various symptoms previously induced by other causes; yet we may very fairly conclude, that it could not probably in any one instance be able to account with satisfaction for their first production.

In many instances the patient, at the very instant of the operation, feels a very unusual degree of pain. In some cases, the violence of the pain is almost unupportable: now this we can never suppose to have been produced by the mere puncture of a vein; for although the coats of veins are not perhaps entirely destitute of feeling, yet we know well that they are not endowed with such a degree of sensibility as to render it probable such intense pain could ever be induced by their being punctured in any way whatever. This inflamed state of the veins therefore, as detected by Mr Hunter after death, must be considered rather as being produced by, than as being productive of, such affections; and that such ailments should frequently produce an inflammation of the contiguous veins, is a very probable conjecture. In the course of 48 hours or so from the operation, when the febrile symptoms are just commencing, such a degree of hardness and evident inflammation is induced over all the parts contiguous to the orifice, that it would be surprising indeed if the vein, which is thus perhaps entirely surrounded with parts highly inflamed, should escape altogether. We shall therefore proceed upon the supposition of this inflamed state of the veins being a consequence rather than the cause of such ailments; and of course we now revert to one or other of the opinions long ago adopted on this subject, that all the train of bad symptoms found on some occasions to succeed to venesection, proceeds either from the wound of a nerve or of a tendon.

92
Tendons when punctured produce as bad symptoms as wounded nerves.
That a partial wound of a nerve will now and then produce very distressing symptoms, no practitioner will deny; but it has been attempted to be shown, that tendons are almost totally destitute of sensibility; and it has therefore been supposed, that their being wounded can never account for the various symptoms known to occur in such cases. There is great reason however to think, that in different instances the same train of symptoms have been induced by different causes; that in one instance a wounded nerve, and in others pricks of the tendons, have given rise to them, as we have already supposed.

93
Method of cure.
However, in order to prevent as much as possible the consequent inflammation and other symptoms which usually ensue, a considerable quantity of blood should be immediately discharged at the orifice just made: the limb, for several days at least, ought to

be kept in a state of perfect rest, care being at the same time taken that the muscles of the part be all preserved in as relaxed a state as possible: the patient should be kept cool; on a low diet; and, if necessary, gentle laxatives ought to be administered.

By such management alone, the fatal symptoms we have enumerated may frequently be prevented; and when they do occur in cases where the above precautions have not been taken, they may be considered to be as much the consequence of negligence in the after-treatment, as of any thing peculiarly bad in the nature of the original accident.

When, however, notwithstanding the means recommended, the symptoms, instead of diminishing, rather become more violent; if the lips of the orifice turn hard and more inflamed, if the pain becomes more considerable, and especially if the swelling begins to spread, other remedies come then to be indicated. In this state of the complaint, topical blood-letting, by means of leeches applied as near as possible to the lips of the wound, frequently affords much relief; and when the pulse is full and quick, it even becomes necessary to evacuate large quantities of blood by opening a vein in some other part.

The external applications usually employed in this state of the complaint, are, warm emollient fomentations and poultices. In similar affections of other parts no remedies with which we are acquainted would probably be found more successful; for as warm fomentations and cataplasms prove in general very powerful agents in the formation of pus, and as nothing would so certainly relieve the symptoms which usually occur here as a free suppuration, applications of this nature were made therefore with some apparent propriety; but it is now almost certain, that little or no advantage is ever to be expected from remedies of this class. And in fact we find, in the complaint now under consideration, that all such applications, instead of being productive of any advantage, rather do harm. The heat of the part is here one of the most distressing symptoms; so that, instead of affording relief, warm emollient applications rather tend to augment this source of uneasiness. The lips of the wound, from not being capable of producing a good suppuration, are by the additional heat applied to them through the medium of such applications, rendered still more hard, swelled, and of course more painful; and the swelling of the contiguous parts also becomes more diffuse over the rest of the member.

By Ambrose Paré, Dionis, Heister, and others, instead of emollient remedies, oil of turpentine, tincture of myrrh, and other heating applications, are recommended. "That these would not prove effectual," says Mr Bell, I cannot from experience pretend to say; for suspecting their powerful stimulating effects might in cases of this nature prove too irritating for parts already by disease rendered exquisitely sensible, I have never, I must own, ventured to use them: but I can from repeated experience assert, that cooling astringent applications afford much more ease, and, upon the whole, in all such ailments, prove more effectual, than warm emollients; and of this class the most effectual I have ever used, are the saturnine applications. The parts chiefly affected being alternately covered with cloths wet with a solution of saccharum saturni, and

95
Cooling astringents of great use.

pledgits

Theory.

Theory.

plodgits spread with Goulard's cerate, are kept more cool and easy than by any other remedy I have ever happened to use.⁹⁶

In all such cases therefore, so soon as the number of leeches proportioned to the violence of the symptoms have been applied to the parts chiefly affected, and have discharged a sufficient quantity of blood, the swelling ought to be covered with pieces of soft linen wet in the saturnine solution; and these being kept constantly moist for the space of a few hours, should be succeeded by Goulard's cerate; and thus every part, in any degree affected, ought to be alternately covered with one or other of these applications so long as any degree of swelling remains.

⁹⁶ Low diet, phlebotomy time be attended to, by keeping the patient cool, on a low diet, preserving a lax state of the bowels; and, if necessary, farther quantities of blood ought to be evacuated.

For the violence of the pain, which is sometimes so excessive as to destroy entirely the patient's rest, opiates ought to be freely exhibited; and when twitchings of the tendons and other convulsive symptoms supervene, medicines of this kind become still more particularly necessary. In order, however, to have a proper influence in this state of the complaint, opiates ought to be given in very full doses; otherwise, instead of answering any good purpose, they constantly tend to aggravate the different symptoms, not only by increasing the heat and restlessness, but by having an evident influence in rendering the system more susceptible than it was before of the pain and other distressing effects produced upon it by the wound: whenever opiates, therefore, are in such circumstances employed, the doses ought always to be considerable.

It often happens, however, in this very alarming disorder, either from neglecting the matter altogether on the accident first happening, as is too frequently the case, or from an improper subsequent treatment by warm emollient applications, that opiates and all the other remedies enumerated are afterwards had recourse to without any advantage whatever: the fever, pain, and swelling of the parts continuing, convulsive affections of the muscles at last occur, all tending to indicate the most imminent danger. In this situation of matters, if we have not immediate recourse to some effectual means, the patient will soon fall a victim to the disorder; and the only remedy from which in these circumstances much real advantage is to be expected, is a free and extensive division of the parts in which the orifice producing all the mischief was at first made. We know well, from the repeated experience of ages, that much more pain and distress of every kind is commonly produced by the partial division either of a nerve or of a tendon, than from any of these parts being at once cut entirely across. Now the intention of the operation here recommended, is to produce a complete division of the nerve or tendon we suppose to have been wounded by the point of the lancet, and which we consider as the sole cause of all the subsequent distresses.

⁹⁸ The operation now recommended being attended with a good deal of pain, and being put in practice for the removal of symptoms from which it is perhaps difficult to persuade the patient that much danger can

occur, all the remedies we have mentioned should be first made trial of before it is proposed: but at the same time, care ought to be taken that the disorder is not allowed to proceed too far before we have recourse to it; for if the patient should be previously much weakened by the severest symptoms having continued violent for any length of time, neither the remedy now proposed, nor any other with which we are acquainted, would probably have much influence. So soon therefore as the course already prescribed has been fairly tried, and is found to be inadequate to the effects expected from it, we ought immediately to have recourse to a free division of the parts chiefly affected; the manner of doing which will be described in its proper place.

These are the general methods of treating simple wounds of the nerves, tendons, or membranes; but where the wounds are very large, and attended with great distraction, laceration, and loss of substance, some farther directions will be necessary; but of these we shall treat in the next section. The total division of a tendon is not attended with much danger where the action of the muscle belonging to it is not necessary to life: for the divided ends of tendons will very readily unite if they are kept close together; and may either be conjoined by suture, or retained in that posture by a proper bandage.

¹⁰⁰ In wounds of the thorax, even tho' none of the viscera should be wounded, we may yet reasonably expect that a considerable quantity of blood will be extravasated; and this, if very large, must be evacuated if possible. However, it ought to be particularly observed, that this extravasated blood should not be discharged before we are assured that the wounded vessels have done bleeding. When the pulse appears sufficiently strong and equal, the extremities are warm, no hiccup or convulsion appears, and the patient's strength continues, we may then know that the internal hemorrhage has ceased, and that the means for discharging the blood may now be safely used. It may, however, be doubted whether the extravasated blood ought always to be discharged by art; since it is apparent from the most faithful observations, that matter, water, blood, &c. have vanished from the cavities of the thorax, and been afterwards discharged by sweat, urine, &c. Yet this but seldom happens; and if we were to trust to nature only in these cases, it is certain that many would perish from a destruction of the vital viscera by the extravasated and putrid blood, who by an artificial extraction of the same blood might have been saved. The extraction therefore is to be attempted, by putting the body in such a posture that the blood may flow out through the orifice of the wound; by sucking through a flexible tube, obdurate at the end, and having holes in its sides; by injections of diluent, attenuating, and deterring liquors; by dilating the wound, or perforating the thorax a little above the diaphragm, as in the operation for an empyema. By one or other of these methods, wounds of the thorax may generally be cured, provided the viscera are not injured in such a manner as to render them incapable of performing the offices of life.

¹⁰¹ In wounds of the abdomen, where the intestines are injured, they must, if possible, be joined by what is called the *Glover's suture*; though, when the wound

Theory.

Theory.

is small, they may be left to themselves. In all wounds of the abdomen, however, there is great danger from the entrance of the air between the integuments and the viscera. This, if confined, will be rarefied to an extreme degree, and occasion the most violent pains, with incredible distention of the abdomen. It is necessary therefore, that the air which has entered should be expelled, by sucking and the effort of respiration; after which the integuments are to be sewed together, and the wound is to be cured in the same manner as directed for simple wounds; only it will require to be dressed as seldom as possible; and a spare diet, with other antiphlogistic regimen, is here absolutely necessary.

103
Of the in-
tellects pro-
lapsed through a
wound
without be-
ing injured.

It sometimes happens, that, through a large wound of the abdominal integuments, the intestine comes out without being injured; yet, if it remains for any time exposed to the air, the case is commonly very dangerous. If assistance can be had at the moment the wound is given, the intestines are immediately to be replaced, and the patient laid in such a posture that they cannot by their own gravity fall out again. However, if assistance is not procured in time, and thus the intestine becomes dry and cold, it ought to be well fomented before it is replaced. Celsus advises also, that those parts of the intestine which prolapsed last should be first replaced, after which the patient should be gently shaken, that each of the intestines may reduce itself to its proper place, and there remain.—This advice is very necessary to be observed; otherwise violent gripes and other bad consequences may follow. Garengot also gives us another advice of no small consequence, namely, that if the wound is in the middle of the abdomen under the navel, penetrating through the rectus muscle on either side, then the prolapsed part of the intestine or omentum is frequently liable to be returned under that muscle, between its body and the tendinous capsule, which very loosely encompasses this muscle below the navel; since it might thus be falsely imagined that the intestine was returned into the abdomen, whence the most violent disorders might ensue. If the intestines are already cold and dry, before any attempts are made to replace them, we ought first to be certain that life remains in these parts: otherwise we might expect an absolute mortification; and though the mortified parts should cast off, the contents of the intestines would escape into the cavity of the abdomen; whence the death of the patient would follow, after the most miserable disorders.

When the wound of the abdomen is large, the intestines easily prolapse, but are as easily returned. But when part of an intestine has been forced through a narrow wound, the disorder is much more dangerous. For the prolapsed intestine being distended by flatus, or the ingested aliments driven thither by the peristaltic motion, it will be inflamed, tumefied, and incapable of being returned through the stricture of the wound; whence a stoppage of the circulation and gangrene will soon follow. In this case the utmost care is to be taken to reduce the intestine to its natural size; and warm fomentations are among the principal means for this purpose. If these should fail, some practitioners of great eminence have advised the puncturing of the intestine in different places in order to discharge the flatus. This practice has also

been recommended in an incarcerated hernia; but is exceedingly disapproved of by Mr Pott; and even in the present case it seems to be very dubious whether any good can possibly arise from it. To puncture any part that is already inflamed, must undoubtedly add to the inflammation; and it is very improbable that the discharge of flatus procured by the punctures would at all be a recompence for the bad consequences produced by the increased inflammation. The method recommended by Celsus seems in this case to be much more eligible; namely, to dilate the wound in such a manner as to reduce the intestine with ease. Sometimes these methods may succeed, and the intestine be preserved whole; though at other times necessary it unavoidably happens that part of it is lost either by suppuration or gangrene. In these cases we must use our utmost endeavours to make the two ends of the intestine unite; and if they do so, the loss of the gangrened or suppurated part will not be much felt: but if this should be found impracticable, the upper part of the intestine should be joined to the edge of the wound; where it will ever afterwards perform the office of an anus, and the fæces will continue to be discharged that way through life. It is to be remarked, however, that even in the most favourable case, viz. where the divided ends of the intestine unite, there will always remain a stricture on the part; for which reason it is requisite that the patient should be very temperate in his diet, eat soft food, and by small quantities at a time; otherwise there will be danger of an obstruction in the place of union, and a rupture may ensue.

103
Treatment
when part
of the in-
testine is
gangrened.

When the omentum appears prolapsed, the same general treatment is to be observed; only that, when it is dry and mortified, the dead part may safely be extirpated.—We shall conclude the article of abdominal wounds with a case from the memoirs of the academy of sciences for the year 1705, which shows that we ought not to despair, even though the most desperate symptoms should take place, as long as any vis vitæ remains. A madman wounded himself in 18 different places of the abdomen. Eight of these penetrated the cavity, and injured the contained viscera; he had a diarrhoea, nausea, and vomiting, tension of the abdomen, with difficult respiration and violent fever, so that his life was despaired of. During the first four days, he was bled seven times; and during the greatest part of the cure his diet consisted almost entirely of flesh-broths, with the addition of some mild vegetables. By these means he was not only cured of his wounds, but restored to his right senses. Seventeen months after, he went mad again, and threw himself over a precipice, by which he was instantly killed: on opening the body, the wounds were found to have penetrated the middle lobe of the liver, the intestinum jejunum, and the colon.

104
Remarkable
case of
wounds in
the abdo-
men.

In wounds of the head, where the cellular mem-
brane only is affected, and the aponeurosis and peri-
cranium untouched, phlebotomy, lenient purges, and
the use of the common febrifuge medicines, particu-
larly those of the neutral kind, generally remove all the
threatening symptoms mentioned, n° 105. When the
inflammation is gone off, it leaves on the skin a
yellowish tint and a dry scurf, which continue until
perspiration takes them away; and upon the removal
of

105
Wounds of
the head.

Theory.

of the disease, the wound immediately recovers an healthy aspect, and soon heals without further trouble. But in the worst kind of these wounds, that is, where a small wound passes through the tela cellulosa and aponeurosis to the pericranium, the patient will admit of more free evacuations by phlebotomy than in the former. In both, the use of warm fomentations is required; but an emollient cataplasm, which is generally forbid in the erysipelatous swellings, may in this latter case be used to great advantage. Where the symptoms are not very pressing, nor the habit very inflammable, this method will prove sufficient; but it sometimes happens that the scalp is so tense, the pain so great, and the symptomatic fever so high, that by waiting for the slow effect of such means, the patient runs a risk from the continuance of the fever; or else the injured aponeurosis and pericranium, becoming sloughy, produce an abscess, and render the case both tedious and troublesome. A division of the wounded part, by a simple incision down to the bone, about half an inch or an inch in length, will most commonly remove all the bad symptoms; and if it be done in time, will render every thing else unnecessary.

106
Of the
joints.

In wounds of the joints, if any thing can be done to save the limb, it must be by dilating the wound in order to discharge the humour, which collects in great quantity. At the same time the most cooling and discent remedies are to be applied to the neighbouring parts, while the wound itself is to be treated with drying gums and balsamics. Relaxing and emollient applications are bad, as causing a great efflux of humour, which at any rate is too copious. The air and cold are likewise to be avoided, and all applications to the wound ought to be of the warm and stimulating kind.

SECT. II. *Of contused and lacerated Wounds, without or with Fractures of the Bones.*

WHEN the small vessels are broken by a blow with any hard instrument without penetrating the skin, at the same time that the solid fibres of the part are crushed, the injury is termed a *contusion*; and when at the same time the skin is broken, it is termed a *contused and lacerated wound*; because in this case the parts are not fairly divided as with a knife, but torn asunder or violently stretched.

107
Simple con-
tusion de-
scribed.

Every contusion therefore, whether the skin is broken or not, may properly be reckoned a wound; for where the injury is so slight that none of the contents of the small vessels are extravasated, it scarce deserves to be mentioned. The immediate consequence of a contusion, therefore, is a swelling, by reason of the extravasation just mentioned; and the skin becomes discoloured by the blood stagnating under it: but as this fluid, even though covered by the skin, cannot long remain in its natural state, it thence happens, that the contused part soon loses its florid red colour, and becomes blue or black; the thinner parts being in the mean time gradually taken up by the absorbent vessels, which at last happens to the blood itself; the blue disappears, and is succeeded by a yellowish colour, showing that the blood is now dissolved; after which the part recovers its former appearance, and the ruptured vessels appear to have united as though nothing had happened.

These are the symptoms which attend the slightest kind of contusions; but it is evident, that where the blow is so violent as to rupture or crush some of the large nerves, blood-vessels, tendons, or membranes, all the bad consequences already mentioned which attend simple wounds of those parts will ensue, and they will not at all be alleviated by the circumstance of the skin being whole. Hence it is easy to see how a contusion may produce ulcers of the worst kind, gangrene, sphacelus, carious bones, &c.; and if it happens to be on a glandular part, a scirrhus or cancer is very frequently found to ensue. Even the viscera themselves, especially of the abdomen, may be injured by contusions to such a degree as to produce an inflammation, gangrene, or scirrhus, nay instant death, without rupturing the skin; and such a blow as a man may strike with his fist will often be sufficient for this purpose, as has been observed in the case of some celebrated boxers.

That the bones may be fractured along with a contusion, is known by every day's experience; however, without being broken, it is certain that they may be so crushed and injured, that the medullary substance contained in them may be vitiated, and thus the most grievous disorders may ensue. But in no part whatever are contusions more dangerous than in the head, as has been confirmed by the most fatal experience, very dangerous. Mr Pott divides into two classes those injuries to which the head is liable from contusion, viz. those in which the mischief is confined to the scalp, and those where the other parts are concerned. The former is of little consequence; the tumour attending it being easily removed, or the extravasated blood with which it is filled may be discharged by a small opening. One circumstance, however, he says, attending this tumour, requires considerable attention; for the tumour here sometimes produces to the fingers a sensation as if the cranium was broken and depressed; whence an inexperienced surgeon might be apt to remove the scalp as in the real fracture, and thus give his patient a great deal of unnecessary pain. The touch therefore being in this case fallacious, it is necessary to wait for the appearance of other symptoms before we proceed to a division of the integuments.

109
Contusions
of the head
very danger-
ous.

The most dangerous contusions of the head are those where the dura mater and parts within the skull are affected; and in order to have a clear idea of this kind of injury, it is necessary to recollect, that the vessels of the pericranium, those of the diploe, or medullary substance between the two tables of some parts of the cranium, and those of the dura mater within it, do all constantly and freely communicate with each other; and that this communication is carried on by means of innumerable foramina, found in all parts of both surfaces of the skull, as well as at the sutures; that upon the freedom of this communication depends the healthy and sound state of all the parts concerned in it; and that from the interruption or destruction of this proceed most of the symptoms attending violent contusions of the head, extravasations of fluid between the cranium and dura mater, inflammations of the said membrane, and simple undepressed fracture of the skull.

110
Reason of
extreme
danger at-
tending
them.

The pericranium is so firmly attached to the outer surface of the skull, as not to be separable from it with-

contusions.

Theory.

Theory.

without considerable violence; and when such violent separation is made in a living subject (especially if young), the cranium is always seen to bleed freely from an infinite number of small foramina. The dura mater, which is a firm strong membrane, is almost as intimately attached to the inside of the skull, as the pericranium is to the outside, and by the same means, viz. by vessels; and by these means a constant circulation and communication are preserved and maintained between the two membranes, and the bones dividing them. This all the appearances which attend the scalping a living person, or the separation of the skull from the dura mater of a dead one, (especially if such person died apoplectic or was hanged), prove beyond all doubt. In the former, the blood will (as we have already observed) be seen issuing from every point of the surface of the cranium: in the latter, not only a considerable degree of force will be found necessary to detach the saved bone from the subjacent membrane, but, when it is removed, a great number of bloody points will be seen all over the surface of the latter; which points, if wiped clean, do immediately become bloody again, being only the extremities of broken vessels. These vessels are largest at and about the sutures; at which places the adhesion is the strongest, and the hæmorrhage upon separation the greatest.

III
Communication
between the
outside and
inside of the
cranium.

III
Mistakes
concerning
the attach-
ment of
the dura
mater.

It has been thought by many, that the dura mater was attached to the skull only at the sutures; that in all other parts it was loose and unconnected with it; and that it constantly enjoyed or performed an oscillatory kind of motion, or was alternately elevated and depressed. This idea and opinion were borrowed from the appearance which the dura mater makes in a living subject, after a portion of the skull has been removed: but although it has been inculcated by writers of great eminence, yet it has no foundation in truth or nature; and has misled many practitioners in their opinions, not only of the structure and disposition of this membrane, but in their ideas of its diseases.

The dura mater does, on the internal surface of the bones of the cranium, the office of periosteum, in the same manner as the pericranium does on the external, (at least they have no other): to this it is so firmly and so generally attached, as to be incapable of any even the smallest degree of motion. The alternate elevation and subsidence of it, which are observable when any portion of it is laid bare, are owing to a very different cause from any power in itself; neither are nor can they ever be performed, until a piece of the cranium has been forcibly taken away, and consequently are not natural or necessary.

By blows, falls, and other shocks, some of the larger of those vessels which carry on this communication between the dura mater and the skull are broken, and a quantity of blood is shed upon the surface of that membrane. This is one species of bloody extravasation, and indeed the only one which can be formed between the skull and dura mater. If the broken vessels be few, and the quantity of blood which is shed be small, the symptoms are generally slight, and by

Vol. X.

I

proper treatment disappear (a). If they are large or numerous, or the quantity of extravasated fluid considerable, the symptoms are generally urgent in proportion: but whether they be slight or considerable, whether immediately alarming or not, they are always and uniformly such as indicate pressure made on the brain and nerves, viz. stupidity, drowsiness, diminution or loss of sense, speech, and voluntary motion.

But it also often happens, from the same kind of violence, that some of the small vessels which carry on the circulation between the pericranium, skull, and dura mater, are so damaged as not to be able properly to execute that office, although there are none so broken as to cause an actual effusion of blood.

Smart and severe strokes on the middle part of the bones, at a distance from the sutures, are most frequently followed by this kind of mischief; the coats of the small vessels which sustain the injury inflame, and become sloughy; and in consequence of such alteration in them, the pericranium separates from the outside of that part of the bone which received the blow, and the dura mater from the inside: the latter of which membranes, soon after such inflammation, becomes sloughy also, and furnishes matter; which matter being collected between the said membrane and the cranium, and having no natural outlet whereby to escape or be discharged, brings on a train of very terrible symptoms, and is a very frequent cause of destruction. The effect of this kind of violence is frequently confined to the vessels connecting the dura mater to the cranium; in which case the matter is external to the said membrane: but it sometimes happens, that by the force either of the stroke or of the concussion, the vessels which pass between and connect the two meninges, are injured in the same manner; in which case, the matter formed in consequence of such violence is found on the surface of the brain, or between the pia and dura mater, as well as on the surface of the latter, or perhaps in all these three situations at the same time.

The difference of this kind of disease from either an extravasation of blood or a commotion of the medullary parts of the brain, is great and obvious. All the complaints produced by extravasation are (as we have already said) such as proceed from pressure made on the brain and nerves, and obstruction to the circulation of the blood through the former; stupidity, loss of sense and voluntary motion, laborious and obstructed pulse and respiration, &c. and (which is of importance to remark) if the effusion be all considerable, these symptoms appear immediately or very soon after the accident.

The symptoms attending an inflamed or sloughy state of the membranes, in consequence of external violence, are very different; they are all of the febrile kind, and never, at first, imply any unnatural pressure; such are, Pain in the head, restlessness, want of sleep, frequent and hard pulse, hot and dry skin, flushed countenance, inflamed eyes, nausea, vomiting, rigor, and toward the end, convulsion, and delirium. And

41 U

none

(a) This must be supposed to be spoken in a general sense; because it is well known, that sometimes a very small quantity of extravasated fluid will produce the most alarming and most pressing symptoms; and that at other times a large quantity will occasion none at all.

III
What injuries

state of the
membranes.

none of these appear at first, that is, immediately after the accident; seldom until some days are past.

One set or class of symptoms are produced by an extravasated fluid making such pressure on the brain and origin of the nerves as to impair or abolish voluntary motion and the senses: the other is caused by the inflamed or putrid state of the membranes covering the brain, and seldom affects the organs of sense until the latter end of the disease; that is, until a considerable quantity of matter is formed, which matter must press like any other fluid.

117
Blood cannot be converted into pus.

It is a generally received opinion, that blood shed from its vessels, and remaining confined in one place, will become pus; and that the matter found on the surface of the dura mater toward the end of these cases was originally extravasated blood. But that pure blood shed from its vessels by means of external violence, and kept from the air, will not turn to or become matter, is proved incontestably by every day's experience in many instances; in aneurisms by puncture, in retained menses by imperforate vaginae, and in all ecchymoses. True pus cannot be made from blood merely; as may be known from the manner in which all abscesses are formed, and from every circumstance attending suppuration: and that the matter found on the surface of the dura mater, after great contusions of the head, never was mere blood, we are as certain as observation and experience can make us.

118
Division of the symptoms by some French writers.

Some of the French writers have indeed divided the symptoms of what they call a *contusion of the head*, into two kinds; and have named them *primitive* or *original* symptoms, and *secondary* or *consequential* ones: among the former, they rank immediate loss of sense, hæmorrhagy, involuntary discharge of urine and feces, great propensity to sleep, &c.; among the latter they reckon fever, delirium, rigor, convulsion, &c. One kind they impute to the mere extravasation of blood, the other to its putrefaction.

119
Objections to it.

This account, though ingenious and specious, is not founded on fact. It is true, that the two kinds of symptoms are very distinct from each other, as well in their nature as in their time and manner of access; and so far the remark is true: but from the best observation and examination, both on the living and on the dead, they appear to proceed from very different causes. That both these kind of symptoms do now and then concur in the same patient, is beyond all doubt; and that the case is thereby rendered complex, and more difficult to be judged of: but this does not constantly happen; and even when it does, there are generally such distinguishing characteristic marks of each, as may prove the truth of what is here asserted.

120
Particular account of the progress of the disease.

If there be neither fissure nor fracture of the skull, nor extravasation, nor commotion underneath it, and the scalp be neither considerably bruised nor wounded, the mischief is seldom discovered or attended to for some few days. The first attack is generally by pain in the part which received the blow. This pain, though beginning in that point, is soon extended all over the head, and is attended with a languor or dejection of strength and spirits, which are soon followed by a nausea and inclination to vomit, a vertigo or giddiness, a quick and hard pulse, and an incapacity of sleeping, at least quietly. A day or two after this attack, if no means to prevent inflammation are used, the part ge-

nerally swells, and becomes puffy and tender, but not painful; neither does the tumour rise to any considerable height, or spread to any great extent. If this tumid part of the scalp be now divided, the pericranium will be found of a darkish hue, and either quite detached or very easily separable from the skull; between which and it will be found a small quantity of a dark-coloured ichor.

If the disorder has made such progress that the pericranium is quite separated and detached from the skull, the latter will even now be found to be somewhat altered in colour from a sound healthy bone. Of this alteration it is not very easy to convey an idea by words; but it is a very visible one, and what some very able writers have noticed. Among these Fallopius particularly: *Inspiciatis diligenter os detestum: quod or, quando est in natura sua, est coloris subrubri, non candidi prorsus, nec rubri prorsus, sed est veluti color mistus ex albo declinans ad rubicandam, ut si multo lacte, aut alio colore candido, poneris parum sanguinis vel alterius rei rubrae. Sed si videritis inaequalitatem coloris in ipso esse detecto, ita ut assint veluti puncta coloris albi, et aridi ossis, que aride aliquando majores sunt, aliquando minores, &c. sciatis quod os sit contusum.*

From this time the symptoms generally advance more hastily and more apparently; the fever increases, the skin becomes hotter, the pulse quicker and harder, the sleep more disturbed, the anxiety and restlessness more fatiguing; and to these are generally added irregular rigors, which are not followed by any critical sweat, and which, instead of relieving the patient, add considerably to his sufferings. If the scalp has not been divided or removed until the symptoms are thus far advanced, the alteration of the colour of the bone will be found to be more remarkable: it will be found to be whiter and more dry than a healthy one; or, as Fallopius has very justly observed, it will be found to be more like a dead bone: the sanies or fluid between it and the pericranium will also, in this state, be found to be more in quantity, and the said membrane will have a more livid diseased aspect.

In this state of matters, if the dura mater be denuded, it will be found to be detached from the inside of the cranium, to have lost its bright silver hue, and to be as it were smeared over with a kind of mucus, or with matter, but not with blood. Every hour after this period, all the symptoms are exasperated, and advance with hasty strides: the headach and thirst become more intense, the strength decreases, the rigors are more frequent, and at last convulsive motions, attended in some with delirium, in others with paralysis or comatose stupidity, finish the tragedy.

If the scalp has not been divided or removed till this point of time, and it be done now, a very offensive discoloured kind of fluid will be found lying on the bare cranium, whose appearance will be still more unlike to the healthy natural one; if the bone be now perforated, matter will be found between it and the dura mater, generally in considerable quantity, but different in different cases and circumstances. Sometimes it will be in great abundance, and diffused over a very large part of the membrane; and sometimes the quantity will be less, and consequently the space which it occupies smaller. Sometimes it lies only on the exterior surface of the dura mater; and sometimes it is between

121

Of the scalp and integuments.

Theory.

Theory.

it and the pia mater, or also even on the surface of the brain, or within the substance of it.

134
Cause of
these symp-
toms.

The primary and original cause of all this is the stroke upon the skull: by this the vessels which should carry on the circulation between the scalp, pericranium, skull, and meninges, are injured; and no means being used to prevent the impending mischief, or such as have been made use of proving ineffectual, the necessary and mutual communication between all these parts ceases; the pericranium is detached from the skull, by means of a sanies discharged from the ruptured vessels; the bone, being deprived of its due nourishment and circulation, loses its healthy appearance; and the dura mater (its attaching vessels being destroyed, or rendered unfit for their office) separates from the inside of the cranium, inflames, and suppurates.

Whoever will attend to the appearances which the parts concerned make in every stage of the disease, to the nature of the symptoms, the time of their access, their progress, and most frequent event, will find them all easily and fairly deducible from the one cause which has just been assigned, *viz.* the contusion. As the inflammation and separation of the dura mater is not an immediate consequence of the violence, so neither are the symptoms immediate, seldom until some days have passed: the fever at first is slight, but increases gradually; as the membrane becomes more and more diseased, all the febrile symptoms are heightened; the formation of matter occasions rigors, frequent and irregular, until such a quantity is collected as brings on delirium, spasms, and death.

135
Appear-
ances when
the scalp is
wounded.

Hitherto we have considered this disease as unaccompanied by any other, not even by an external mark of injury, except perhaps a trifling bruise of the scalp: let us now suppose the scalp to be wounded at the time of the accident, by whatever gave the contusion; or let us suppose, that, the immediate symptoms having been alarming, a part of the scalp had been removed in order to examine skull.

In this case the wound will for some little time have the same appearance as a mere simple wound of this part, unattended with other mischief, would have; it will, like that, at first discharge a thin sanies or gleet, and then begin to suppurate; it will digest, begin to incarnate, and look perfectly well. But after a few days all these favourable appearances will vanish; the sore will lose its florid complexion and granulated surface, will become pale, glassy, and flabby; instead of good matter, it will discharge only a thin discoloured sanies; the lint with which it is dressed, instead of coming off easily (as in a kindly suppurating sore), will stick to all parts of it; and the pericranium, instead of adhering firmly to the bone, will separate from it all round, to some distance from the edges.

This alteration in the face and circumstances of the sore, is produced merely by the diseased state of the parts underneath the skull; which is a circumstance of great importance in support of the doctrine advanced; and is demonstrably proved, by observing that this diseased aspect of the sore, and this spontaneous separation of the pericranium, are always confined to that part which covers the altered or injured portion of the dura mater, and do not at all affect the rest of the scalp; nay, if it has by accident been wounded in any

other part, or a portion has been removed from any part where no injury has been done to the dura mater, no such separation will happen; the detachment above will always correspond to that below, and be found nowhere else.

The first appearance of alteration in the wound immediately succeeds the febrile attack; and as the febrile symptoms increase, the sore becomes worse and worse, that is, degenerates more and more from a healthy, kindly aspect.

Through the whole time, from the first attack of the fever to the last and fatal period, an attentive observer will remark the gradual alteration of the colour of the bone if it be bare: at first it will be found to be whiter and more dry than the natural one; and as the symptoms increase, and either matter is collected or the dura mater becomes sloughy, the bone inclines more and more to a kind of purulent hue or whitish yellow: and it may also be worth while in this place to remark, that if the blow was on or very near to a future, and the subject young, the said suture will often separate in such a manner as to let through it a loose, painful, ill-conditioned fungus; at which time also it is no uncommon thing for the patient's head and face to be attacked with an erysipelas.

We have said, that in those cases in which the scalp is very little injured by the bruise, and in which there is no wound, nor any immediately alarming symptoms or appearances, that the patient feels little or no inconvenience, and seldom makes any complaint until some few days are past. That at the end of this uncertain time, he is generally attacked by the symptoms already recited. That these are not pressing at first, but that they soon increase to such a degree as to baffle all our art; from whence it will appear, that when this is the case, the patient frequently suffers from what seems at first to indicate his safety, and prevents such attempts being made, and such care from being taken of them, as might prove preventative of mischief.

But if the integuments are so injured as to excite or ¹³⁶claim our early regard, very useful information may be gained from thence be collected. For whether the scalp be considerably bruised or not, if in the place of such bruise the pericranium be found spontaneously detached from the skull, having a quantity of discoloured sanies be-
tween them, under the tumid part, in the manner already mentioned, it may be regarded as a pretty certain indication, either that the dura mater is beginning to separate in the same manner, or that, if some preventative means be not immediately used, it will soon suffer; that is, it will inflame, separate from the skull, and give room for a collection of matter between them. And with regard to the wound itself, whether it was made at the time of the accident, or afterward artificially, it is the same thing; if the alteration of its appearance be as above related, if the edges of it spontaneously quit their adhesion to the bone, and the febrile symptoms are at the same time making their attack, these circumstances will serve to convey the same information, and to prove the same thing.

This particular effect of contusion is frequently found to attend on fissures and undepressed fractures of the cranium, as well as on extravasation of fluids in cases where the bone is entire; and on the other hand,

Theory. all these do often happen without the concurrence of this individual mischief. All this is matter of accident: but let the other circumstances be what they may, the spontaneous separation of the altered pericranium in consequence of a severe blow, is almost always followed by a suppuration between the cranium and dura mater; a circumstance extremely well worth attending to in fissures and undepressed fractures of the skull, because it is from this circumstance principally that the bad symptoms and the hazard in such cases arise.

127
Separation of the pericranium followed by a suppuration of the dura mater.

It is no very uncommon thing for a smart blow on the head to produce some immediate bad symptoms; which after a short space of time disappear, and leave the patient perfectly well. A slight pain in the head, a little acceleration of pulse, a vertigo, and sickness, sometimes immediately follow such accident, but do not continue many hours, especially if any evacuation has been used. These are not improbably owing to a slight commotion of the brain; which having suffered no material injury thereby, they soon cease. But if after an interval of some time the same symptoms are renewed; if the patient, having been well, becomes again feverish and restless; and that without any new cause; if he complains of being languid and uneasy, sleeps disturbedly, loses his appetite, has a hot skin, a hard quick pulse, and a flushed heated countenance, and neither irregularity of diet nor accidental cold have been productive of these, mischief is most certainly impending, and that most probably under the skull.

128
Signs of an effusion of fluid under the cranium.

If the symptoms of pressure, such as stupidity, loss of sense, voluntary motion, &c. appear some few days after the head has suffered injury from external mischief, they do most probably imply an effusion of a fluid somewhere. This effusion may be in the substance of the brain; in its ventricles, between its membranes, or on the surface of the dura mater: and which of these is the real situation of such extravasation, is a matter of great uncertainty; none of them being attended with any peculiar mark or sign that can be depended upon, as pointing it out precisely: but the inflammation of the dura mater, and the formation of matter between it and the skull, in consequence of contusion, is generally indicated and preceded by a puffy, circumscribed, indolent tumour of the scalp, and a spontaneous separation of the pericranium from the skull under such tumour.

These appearances therefore following a smart blow on the head, and attended with languor, pain, restlessness, watching, quick pulse, headache, and slight irregular shiverings, do almost infallibly indicate an inflamed dura mater, and pus either forming or formed between it and the cranium.

By detachment of the pericranium is not meant every separation of it from the bone which it should cover. It may be and often is cut, torn, or scraped off, without any such consequence: but these separations are violent; whereas this is spontaneous, and is produced by the destruction of those vessels by which it was connected with the skull, and by which the communication between it and the internal parts was carried on: and therefore it is to be observed, that it is not the mere removal of that membrane which causes the bad symptoms, but it is the inflammation of the dura mater; of which inflammation this spontaneous

secession of the pericranium is an almost certain indication.

129
Separation of both tables of the cranium sometimes takes place.

Besides the mischiefs already mentioned, Mr Pott observes, that sometimes an exfoliation or separation of both tables of the cranium takes place from external violence, such as happen spontaneously in old or neglected venereal disorders. This disease, which has its seat in the diploe, often spoils the whole substance of the bone, and produces a separation of a part of it. This kind of venereal caries is most frequently of a small extent, and affects different parts of the skull; though sometimes it may be of large extent in one piece. The separated part is generally quite carious, and appears as if it had been worm-eaten. The surface of the bone so diseased is seldom much elevated, though generally somewhat: neither has it often the circumscribed form and appearance of a true node, as it is called; though now and then it has.

The scalp which covers a bone in this state is most frequently diseased also; sometimes with one large ill-conditioned sore; but more often with a number of crude, foul, painful, serpiginous ulcers; through most of which a probe will discover a rough bare bone, and from which is constantly discharged a greasy stinking sanies. This complaint is generally accompanied by a nocturnal headache, pocky spots, and pains about the breast and shoulders; and is almost always preceded by the former, though very frequently that symptom ceases, either during the mercurial courses instituted for that purpose, or when the pericranium covering the diseased part becomes foul and sloughy.

The proportion of extent of surface which one table of these diseased parts of the cranium bears to the diseased part of the other table, is very uncertain, and often very unequal. Sometimes the alteration of the outer table is much more extensive than that of the inner; in which case, when the separation is made, the detached piece comes away very easily, and the uncovered part of the dura mater is small compared to the size of the external fore: but sometimes, on the contrary, the disease occupies a more considerable extent of the inner table than of the outer, and thereby renders the case more difficult and the cure more tedious.

Where the skull is broken, the most violent symptoms frequently, though not always, take place at the very beginning. Mr Pott divides this kind of injury into two general classes, *viz.* those in which the broken parts keep their proper level, and those in which they do not; or, in other words, fractures without and fractures with depression. The symptoms of a fractured cranium have been universally reckoned, Loss of sense, giddiness, vomiting, bleeding at the ears, nose, mouth, &c. But though these do frequently accompany a broken skull, they are by no means produced by the breach made in the bone, nor do they indicate any such breach to have been made. They proceed entirely from some violence offered to the contents of the cranium, and either do or do not accompany fractures as they happen to be joined with such injuries or not. These symptoms are frequently produced by extravasations of blood or serum upon the membranes of the brain, or between them. They may also be the consequence of shocks or concussions of the brain itself, where the skull is perfectly entire. On the other

130
Of fractures of the cranium.

Theory.

other hand, the bones of the cranium are sometimes cracked, broken, nay, even depressed, and the patient suffers none of these symptoms. Hence it is difficult to know when the skull is fractured and when it is not; and hence arises one source of danger in contusions and wounds of the head; for as it is impossible to know whether the cranium is fractured or not, the surgeon is often not warranted to divide the scalp until some urgent symptoms appear, after which it too frequently happens that all assistance comes too late. But if by any means the surgeon is assured that the skull is broken, it will then be incumbent on him at all events to proceed in the manner to be afterwards directed for curing these kinds of injuries.

Sometimes, though rarely, it happens that one of tables of the skull only is injured; but in this the symptoms are so much alike with the foregoing, that it is needless to take further notice of them: we shall therefore only consider one symptom more, and which attends injuries done to the substance of the brain itself. This is a fungous excrecence of the brain, somewhat resembling the fungous or proud flesh already mentioned, which grows up in ill-conditioned wounds in any part of the body. These fungi of the brain arise very suddenly and unexpectedly, and expand to a considerable bulk; and grow the largest when the patient is seized with a violent fever. However, they are seldom formed when the dura mater continues entire; for this membrane, being very strong, sufficiently confines the brain: but when it is divided, together with the pia mater, the fungi increase most of all. These substances seem entirely to be produced from the cortical substance of the brain, and never have any portion of the medulla; whence they are sometimes extirpated with safety, though their appearance is at any rate to be accounted a very bad symptom.

In violent contusions and lacerations of the membranes and tendons, all the symptoms which we have before mentioned will arise with aggravation; and death very frequently ensues, after the most terrible convulsions. These are very frequent in gunshot wounds; but the different ways in which people may be affected in consequence of these wounds, it is impossible to recount. One thing to be observed in gunshot wounds is, that the entrance of them is always narrower than the place where the ball comes out, provided it goes quite through the limb; because the violent impetus of the ball drives in and contuses the flesh before it as it goes in, while it lacerates and tears it out in going through the other side. By reason of this extreme contusion and laceration, there is frequently very little hæmorrhage from gunshot wounds, even when considerable vessels are injured; and hence probably proceeds the notion of an eschar in gunshot

wounds, as if they were burnt by the heat of the bullet. But it is impossible that a true eschar can in this case be formed; because it is demonstrated that bullets acquire no heat while flying in the air, nor unless they strike upon an hard obstacle*. That a violent distension of the vessels will prevent hæmorrhage, is plain from the case of those who have unhappily got their arms torn off by entangling about mills or other machinery; for in none of these do the axillary artery bleed, notwithstanding its magnitude. The reason of this seems to be, that the vessels entirely lose their elasticity, and collapse by the pressure of the surrounding parts in such a manner that the blood cannot pass through them.

With regard to the cure of simple contusions of the fleshy parts, they are in general easily removed by the common discutient applications, of which none is better than vinegar and crude sal ammoniac. If the blow has been very violent, the part will perhaps suppurate; in which case it is to be treated as afterwards directed when we come to speak of tumours. The danger of contused wounds in the head, however, is greater than in any other part of the body. Here it sometimes happens, that the scalp is so wounded at the time of the accident, or so torn away, as to leave the bone perfectly bare, and yet the violence has not been such as to produce the evil abovementioned. In this case, if the pericranium be only turned back along with the detached portion of scalp, there may be probability of its reunion; and it should therefore be immediately made clean and replaced, for the purpose of such experiment, which, if it succeeds, will save much time, and prevent considerable deformity. If this attempt does not succeed, the detached piece may be removed, and the case then becomes as if the scalp and the pericranium had been forced away at the time that the wound was first inflicted; and the worst that can happen, is an exfoliation from the bare skull (c).

It does also sometimes happen, that the force which detaches or removes the scalp does also occasion the mischief in question; but the integument being wounded or removed, we cannot have the criterion of the tumour of the scalp for the direction of our judgment. In these circumstances our whole attention must be directed to the wound and general symptoms. The edges of the former will digest as well, and look as kindly for a few days, as if no mischief was done underneath; but after some little space of time, when the patient begins to be restless and hot, and to complain of pain in the head, these edges will lose their vermilion hue, and become pale and flabby; instead of matter, they will discharge a thin gleet; and the pericranium will loosen from the skull, to some distance from the said edges. Immediately after this, all the general

Of contused wounds of the head, where the pericranium and scalp are detached from the bone.

139
Appearance of the wound when the internal parts are injured.

(c) Not that exfoliation is the necessary consequence of the skull being laid bare; this depends upon other circumstances besides the mere removal of the scalp and pericranium. The solidity of the surface of the bones, the size of the vessels, and the impulse of the blood through them, are what principally determine that. If the cortex of the bone be not very hard, and the impulse of the blood be capable of counterbalancing the effects of the external air, a granulation of flesh will be generated on the surface of the bone, which will cover and firmly adhere to it, without throwing off the smallest exfoliation, especially in young subjects. On the contrary, if the bone be much hardened, and the vessels thereby constricted; or if such applications be made use of as will produce an artificial constriction of them; the surface will necessarily become dry, and, the juices ceasing to circulate through it, it must part with a scale to a certain depth; that is, that part through which the circulation ceases to be carried on will be separated from and cast off by the vessels which nourish the rest of the bone.

Of gunshot wounds.

135
Why there is little hæmorrhage in these wounds.

Theory.

Symptoms are increased and exasperated, and as the inflammation of the membrane is heightened or extended, they become daily worse and worse, until a quantity of matter is formed, and collected, and brings on that fatal period which, though uncertain as to date, very seldom fails to arrive.

139
General indications of cure.

The method of attempting the relief of this kind of injury consists in two points; *viz.* to endeavour to prevent the inflammation of the dura mater; or, that being neglected, or found impracticable, to give discharge to the fluid collected within the cranium in consequence of such inflammation.

140
Exceeding usefulness of bleeding.

Of all the remedies in the power of art for inflammations of membranous parts, there is none equal to phlebotomy. To this truth many diseases bear testimony; pleurifies, ophthalmies, strangulated hernias, &c. and if any thing can particularly contribute to the prevention of the ills likely to follow severe contusions of the head, it is this kind of evacuation: but then it must be made use of in such a manner as to become truly a preventative; that is, it must be made use of immediately, and freely.

141
It ought never to be omitted.

It will in general indeed be found very difficult to persuade a person, who has had what may be called only a *knock on the pate*, to submit to such discipline, especially if he finds himself tolerably well. He will be inclined to think, that the surgeon is either unnecessarily apprehensive, or guilty of a much worse fault; and yet, in many instances, the timely use or the neglect of this single remedy makes all the difference between safety and fatality.

It may be said, that as the force of the blow, the height of the fall, the weight of the instrument, &c. can never precisely or certainly determine the effect, nor inform us whether mischief is done under the bone or not, a large quantity of blood may be drawn off unnecessarily in order to prevent an imaginary evil. This is in some degree true; and if the advice just given were universally followed, many people would be largely bled without necessity; but then, on the other hand, many a very valuable life would be preserved, which for want of this kind of assistance is lost. And if it be allowed to use such means as may be in themselves hazardous, surely it cannot be wrong to employ one which is not so; at least if it be considered in a general sense, whatever it may accidentally prove to some few particular individuals.

Acceleration or hardness of pulse, restlessness, anxiety, and any other degree of fever, after a smart blow on the head, are always to be suspected and attended to. Immediate, plentiful, and repeated evacuation by bleeding, have in many instances removed these, in persons to whom, in all probability, very terrible mischief would have happened had not such precaution been used. In this, as well as some other parts of practice, we neither have nor can have any other method of judging, than by comparing together cases apparently similar. It is by no means, however, to be inferred from hence, that early bleeding will always prove a certain preservative; and that they only die to whom it has not been applied: this, like all other human means, is fallible; and perhaps there are more cases out of its reach than within it: but where preventative means can take place, this is certainly the best, and the most frequently successful.

The second intention, *viz.* the discharge of matter

collected under the cranium, can be answered only by Theory.

When, from the symptoms and appearances already described, there is just reason for supposing matter to be formed under the skull, the operation of perforation cannot be performed too soon; it seldom happens that it is done soon enough.

The propriety or impropriety of applying the trephine in cases where there is neither fissure, fracture, nor symptom of extravasation, is a point which has been much litigated, and remains still unsettled either by writers or practitioners.

When there is no reason for suspecting either of those injuries, either from the symptoms or from the appearances, and the pericranium, whether the scalp be wounded or not, remains firmly attached in all parts to the skull, there certainly is not (let the general symptoms be what they may) any indication where to apply the instrument; and consequently no sufficient authority for using it at all. But whenever that membrane, after the head has received an external violence, separates, or is detached spontaneously from the bones underneath it, and such separation is attended with the collection of a small quantity of thin brown ichor, an alteration of colour in the separated pericranium, and an unnatural discoloured of the bone, we cannot help thinking that there is as good reason for trepanning as in the case of fracture: we believe experience would vindicate us, if we said *better* reason; since it is by no means unfrequent for the former kind of case to do well without such operation, whereas the latter (we mean supuration under the skull) never can.

All the best practitioners have always agreed in acknowledging the necessity of perforating the skull in the case of a severe stroke made on it by gunshot, upon the appearance of any threatening symptoms, even though the bone should not be broken: and very good practice it is. A wound by gunshot (as far as it relates to the skull) is to be regarded only as one attended with a very high degree of contusion, and therefore most likely to produce symptoms accordingly; among which, inflammation of the dura mater stands principal. Experience confirms both: most of the symptoms attending wounds of the head made by gunshot, are symptoms of contusion; and the formation of matter between the cranium and dura mater is a very frequent and very fatal consequence of such contusion.

In short, the spontaneous separation of the pericranium, if attended with general disorder of the patient, with a chilliness, horripilation, languor, and some degree of fever, appears to us, from all the observation we have been capable of making, to be so sure and certain an indication of mischief underneath, either present or impending, that we should never hesitate about perforating the bone in such circumstances.

When the skull has been once perforated, and the dura mater thereby laid bare, the state of the latter cases it is must principally determine the surgeon's future conduct. In some cases one opening will prove sufficient for all necessary purposes, in others several may be necessary. This variation will depend on the space of detached dura mater and the quantity of collected matter. The repetition of the operation is warranted both by the nature of the case, and by the best authorities, there being no comparison to be made between the

143
Dispute concerning the perforation forming this operation.

144
Ought always to be performed where the pericranium separates from the skull.

145
In what cases it is to be repeated.

146
Of perforating the cranium.

Theory.

Theor.

the possible inconvenience arising from largely denuding the dura mater, and the certain as well as terrible evils which must follow the formation and confinement of matter between it and the skull.

146
The antiphlogistic regimen necessary after the operation.

It can hardly be necessary to observe, that notwithstanding the operation of perforation be absolutely and unavoidably necessary, yet the repetition of blood-letting, of cooling laxative medicines, the use of antiphlogistic remedies, and a most strict observance of a low diet and regimen, are as indispensably requisite after such operation as before: the perforation lets the membrane free from pressure, and gives vent to collected matter, but nothing more: the inflamed state of the parts under the skull, and all the necessary consequences of such inflammation, call for all our attention full as much afterwards as before; and although the patient must have perished without the use of the trephine, yet the merely having used it will not preserve him without every other caution and care.

147
Of cases where the cranium is fractured.

In those cases where the bone is evidently fractured, if the solution of continuity be either produced by such a degree of violence as hath caused a considerable disturbance in the medullary parts of the brain, or has disturbed any of the functions of the nerves going off from it, or has occasioned a breach of any vessel or vessels, whether sanguine or lymphatic, and that hath been followed by an extravasation or lodgement of fluid, the symptoms necessarily consequent upon such derangement, or such pressure, will follow; but they do not follow because the bone is broken: their causes are superadded to the fracture; and although produced by the same external violence, are yet perfectly and absolutely independent of it; so much so, that, as we have already observed, they are frequently found where no fracture is.

The operation of the trepan is frequently performed in the case of simple fractures, and that very judiciously and properly. But it is not performed because the bone is broken or cracked: a mere fracture or fissure of the skull can never require perforation, or that the dura mater under it be laid bare. The reason for doing this springs from other causes than the fracture, and those really independent on it. They spring from the nature of the mischief which the parts within the cranium have sustained, and not from the accidental division of the bone. From these arise the threatening symptoms, from these all the hazard, and from these the necessity and vindication of performing the operation of the trepan.

If a simple fracture of the cranium was unattended in present with any of the before-mentioned symptoms, and there was no reason for apprehending any other evil in future, that is, if the solution of continuity in the bone was the whole disease, it could not possibly indicate any other curative intention but the general one in all fractures, viz. union of the divided parts. But how can such union be promoted or assisted by perforation? It most certainly cannot; and yet perforation is absolutely necessary in seven cases out of ten of simple undepressed fractures of the skull.

148
Reasons for trepanning in the case of fractures.

The reasons for trepanning in these cases are, first, the immediate relief of present symptoms arising from pressure of extravasated fluid; or, second, the discharge of matter formed between the skull and dura mater in consequence of inflammation; or, third, the

prevention of such mischief as experience has shown may most probably be expected from such kind of violence offered to the last-mentioned membrane.

In the first case (that of an extravasated fluid within the cranium), the relief from perforation is not only sometimes immediate, but frequently is not attainable by any other means. This is a sufficient proof, not only of its utility, but of its necessity.

In the second (of formation of matter between the skull and dura mater), there is no natural outlet by which such matter can escape; and the only chance of life is from the operation.

In the third, that of mere fracture, without depression of bone, or the appearance of such symptoms as indicate commotion, extravasation, or inflammation, it is used as a preventative; and therefore is a matter of choice more than immediate necessity.
